

Easy Access Rules for Air Operations

EASA eRules: aviation rules for the 21st century

Rules are the core of the EU civil aviation system. The aim of the **EASA eRules** project is to make them **accessible** to stakeholders in an efficient and reliable way.

EASA eRules is a comprehensive, single system for structuring, sharing, and storing of rules. It is the single, easy-access online database for all aviation safety rules applicable to European airspace users.

Easy Access Rules (EAR) are the output of the eRules project. They are consolidated versions of those rules, combining EU regulations with EASA certification specifications (CSs), acceptable means of compliance (AMC), and guidance material (GM) in an easy-to-read format with advanced navigation features through links and bookmarks. EAR are regularly updated, following the adoption of an official publication.

EAR are available:

- in PDF format;
- as dynamic online publications (online format) with a wide range of functionalities, such as filters to obtain regulatory material tailored to one's needs, a search function through the table of contents to quickly access the relevant sections, and easy navigation for computers, tablets, and mobiles; and
- in XML (machine-readable format) that can be easily processed and automated by recipients, producing output that is compatible and can be synchronised with local applications, search databases, etc.

The **EASA eRules** system is developed and implemented in close cooperation with the Member States and aviation industry to ensure that all its capabilities are relevant and effective.

DISCLAIMER

This document is issued by the European Union Aviation Safety Agency (referred to as both 'EASA' and 'the Agency') to provide its stakeholders with an updated, consolidated, and easy-to-read publication. It has been prepared by putting together the officially published EU regulations with the related EASA certification specifications (CSs), acceptable means of compliance (AMC) and guidance material (GM) (including their amendments) adopted so far. However, this document is not an official publication, and EASA accepts no liability for damage of any kind resulting from the risks inherent in its use.

NOTE FROM THE EDITOR

The content of this document is arranged as follows: the cover regulation (recitals and articles) of the implementing rule (IR) or delegated rule (DR) appears first, then the IR or DR annex points, followed by the related acceptable means of compliance (AMC) and guidance material (GM).

In case of certification specifications (CSs), a CS is followed by the related GM.

All elements (i.e. articles, IRs, DRs, AMC, CSs, and GM) are colour-coded and can be identified according to the illustration below. The EU regulation or EASA Executive Director (ED) decision through which the article, IR, DR, CS, AMC, or GM was introduced or last amended is indicated below the article, IR, DR, CS, AMC, or GM title in *italics*.

<u>Cover regulation article</u>	<i>EU regulation</i>
Implementing rule annex or delegated rule annex	<i>EU regulation</i>
Certification specification	<i>ED decision</i>
Acceptable means of compliance	<i>ED decision</i>
Guidance material	<i>ED decision</i>

Note:

Rules that have a future applicability date are marked with purple. The respective applicability date is indicated below the rule text in purple, in square brackets '[]', and in *italics*.

This document will be updated regularly to incorporate further amendments.

The format of this document has been adjusted to make it user-friendly and for reference purposes. Any comments should be sent to erules@easa.europa.eu.

INCORPORATED AMENDMENTS

IMPLEMENTING RULES (IRs) (COMMISSION REGULATIONS)

Commission Regulation	Affected Annex	Applicability date ¹
Regulation (EU) No 965/2012	Annex I (Definitions) Annex II (Part-ARO) Annex III (Part-ORO) Annex IV (Part-CAT) Annex V (Part-SPA)	28/10/2012
Regulation (EU) No 800/2013 (NCC, NCO)	Annex I (Definitions) Annex II (Part-ARO) Annex III (Part-ORO) Annex V (Part-SPA) Annex VI (Part-NCC) Annex VII (Part-NCO)	25/8/2013 Opt-out: 25/08/2016
Regulation (EU) No 71/2014 (OSD)	Annex III (Part-ORO) Annex V (Part-SPA)	17/2/2014 Not later than 18 Dec. 2018 or 2 years after the OSD was approved, whichever is the latest
Regulation (EU) No 83/2014 (FTL)	Annex II (Part-ARO) Annex III (Part-ORO)	18/2/2016 Opt-out: ORO.FTL.205(e): 17/02/2017
Regulation (EU) No 379/2014 (SPO, CAT A-A, Sailplanes and balloons)	Annex I (Definitions) Annex II (Part-ARO) Annex III (Part-ORO) Annex IV (Part-CAT) Annex V (Part-SPA) Annex VI (Part-NCC) Annex VII (Part-NCO) Annex VIII (Part-SPO)	1/7/2014 CAT, non-commercial ops and SPO with balloons: 08/4/2018 CAT, non-commercial ops and SPO with sailplanes: 08/04/2019
Regulation (EU) 2015/140 (Sterile flight deck procedures)	Annex I (Definitions) Annex III (Part-ORO) Annex IV (Part-CAT) Annex VII (Part-NCO) Annex VIII (Part-SPO)	19/2/2015 Cover Reg. 'Art. 9b Review': 18/2/2016
Regulation (EU) 2015/640 (Part 26)	Annex III (Part-ORO)	14/5/2015 Some rules in Part-26
Regulation (EU) 2015/1329 (Dry-lease; FDM AOC aeroplanes)	Annex II (Part-ARO) Annex III (Part-ORO) Annex IV (Part-CAT)	1/10/2015 Opt-out: ORO.AOC.110(d): 25/08/2017

¹ This is the main date of application (i.e. the date from which an act or a provision in an act produces its full legal effects) as defined in the relevant cover regulation article. However, some provisions of the regulations may be applicable at a different date (deferred applicability). Additionally, there may be some opt-outs (derogations from certain provisions) notified by the Member States.

Regulation (EU) 2015/2338 (Flight recordings, aircraft tracking system, ULD)	Annex I (Definitions) Annex IV (Part-CAT) Annex VI (Part-NCC) Annex VIII (Part-SPO)	5/1/2016 CAT.GEN.MPA.205: - 16/12/2018 CAT.IDE.A.185: - (b): 31/12/2018; - (c), (d): 01/01/2019 - (h): 16/06/2018 CAT.IDE.A.190(e), 195(d): - 16/06/2018 CAT.IDE.A.285: - 01/01/2019 CAT.IDE.H.185: - (c): 01/01/2019 - (g): 01/01/2020 CAT.IDE.H.190, 195: - 01/01/2020 NCC.IDE.A/H.160, 165, 170: - 01/01/2020 SPO.IDE.A/H.140, 145, 150: - 01/01/2020

ARO.GEN.005 Scope 219

SUBPART GEN: GENERAL REQUIREMENTS 220

SECTION I – General	220
ARO.GEN.115 Oversight documentation	220
ARO.GEN.120 Means of compliance	220
AMC1 ARO.GEN.120(d)(3) Means of compliance	221
AMC1 ARO.GEN.120(e) Means of compliance	221
GM1 ARO.GEN.120 Means of compliance	221
ARO.GEN.125 Information to the Agency	221
ARO.GEN.135 Immediate reaction to a safety problem	222
SECTION II – Management	222
ARO.GEN.200 Management system	222
AMC1 ARO.GEN.200(a) Management system	223
GM1 ARO.GEN.200(a) Management system	223
AMC1 ARO.GEN.200(a)(1) Management system	224
AMC1 ARO.GEN.200(a)(2) Management system	225
AMC2 ARO.GEN.200(a)(2) Management system	226
AMC3 ARO.GEN.200(a)(2) Management system	226
AMC4 ARO.GEN.200(a)(2) Management system	227
AMC5 ARO.GEN.200(a)(2) Management system	228
GM1 ARO.GEN.200(a)(2) Management System	228
GM2 ARO.GEN.200(a)(2) Management system	231
GM3 ARO.GEN.200(a)(2) Management system	231
GM4 ARO.GEN.200(a)(2) Management system	231
GM5 ARO.GEN.200(a)(2) Management system	232
GM6 ARO.GEN.200(a)(2) Management system	232
GM7 ARO.GEN.200(a)(2) Management system	232
AMC1 ARO.GEN.200(d) Management system	233
ARO.GEN.205 Allocation of tasks to qualified entities.....	234
ARO.GEN.210 Changes in the management system.....	234
ARO.GEN.220 Record-keeping	234
AMC1 ARO.GEN.220(a) Record-keeping	235
AMC1 ARO.GEN.220(a)(1);(2);(3) Record-keeping	236
AMC1 ARO.GEN.220(a)(4);(4a) Record-keeping	236
GM1 ARO.GEN.220(a)(4) Record-keeping	236
GM1 ARO.GEN.220(a)(4a) Record-keeping	237
AMC1 ARO.GEN.220(a)(7) Record-keeping	237
GM1 ARO.GEN.220 Record-keeping	237
SECTION III – Oversight, certification and enforcement	238
ARO.GEN.300 Oversight.....	238
AMC1 ARO.GEN.300(a);(b);(c) Oversight	238
AMC2 ARO.GEN.300(a);(b);(c) Oversight	239
GM1 ARO.GEN.300(a);(b);(c) Oversight	240
GM2 ARO.GEN.300(a);(b);(c) Oversight	240
GM3 ARO.GEN.300(a);(b);(c) Oversight	240
GM4 ARO.GEN.300(a);(b);(c) Oversight	241

AMC1 ARO.GEN.300(a)(2) Oversight.....	241
GM1 ARO.GEN.300(d) Oversight.....	242
ARO.GEN.305 Oversight programme.....	242
AMC1 ARO.GEN.305(b);(d);(d1) Oversight programme.....	243
AMC2 ARO.GEN.305(b) Oversight programme.....	244
GM1 ARO.GEN.305(b) Oversight programme.....	245
GM1 ARO.GEN.305(b);(c);(d);(d1) Oversight programme.....	245
AMC1 ARO.GEN.305(b)(1) Oversight programme.....	245
AMC2 ARO.GEN.305(b)(1) Oversight programme.....	246
AMC1 ARO.GEN.305(b);(c);(d);(d1) Oversight programme.....	246
AMC1 ARO.GEN.305(c) Oversight programme.....	247
AMC2 ARO.GEN.305(c) Oversight programme.....	247
AMC1 ARO.GEN.305(d) Oversight programme.....	248
AMC1 ARO.GEN.305(d1) Oversight programme.....	248
GM1 ARO.GEN.305(d1) Oversight programme.....	249
AMC1 ARO.GEN.305(e) Oversight programme.....	249
ARO.GEN.310 Initial certification procedure – organisations.....	249
AMC1 ARO.GEN.310(a) Initial certification procedure – organisations.....	249
ARO.GEN.330 Changes – organisations.....	251
AMC1 ARO.GEN.330 Changes – organisations.....	252
GM1 ARO.GEN.330 Changes – organisations.....	252
ARO.GEN.345 Declaration – organisations.....	252
AMC1 ARO.GEN.345 Declaration – organisations.....	253
GM1 ARO.GEN.345 Declaration – organisations.....	253
ARO.GEN.350 Findings and corrective actions – organisations.....	253
GM1 ARO.GEN.350 Findings and corrective actions – organisations.....	254
GM2 ARO.GEN.350(d) Findings and corrective actions – organisations.....	255
ARO.GEN.355 Findings and enforcement measures – persons.....	255
GM1 ARO.GEN.355(b) Findings and enforcement measures – persons.....	255
ARO.GEN.360 Findings and enforcement measures – all operators.....	255
SUBPART OPS: AIR OPERATIONS.....	257
SECTION I – Certification of commercial air transport operators.....	257
ARO.OPS.100 Issue of the air operator certificate.....	257
GM1 ARO.OPS.100(b) Issue of the air operator certificate.....	257
ARO.OPS.105 Code-share arrangements.....	258
AMC1 ARO.OPS.105 Code-share arrangements.....	258
AMC2 ARO.OPS.105 Code-share arrangements.....	258
ARO.OPS.110 Lease agreements for aeroplanes and helicopters.....	259
AMC1 ARO.OPS.110 Lease agreements for aeroplanes and helicopters.....	260
AMC2 ARO.OPS.110 Lease agreements for aeroplanes and helicopters.....	260
GM1 ARO.OPS.110 Lease agreements for aeroplanes and helicopters.....	260
GM2 ARO.OPS.110 Lease agreements for aeroplanes and helicopters.....	260
GM3 ARO.OPS.110 Lease agreement.....	261
SECTION Ia – Authorisation of high risk commercial specialised operations.....	261
ARO.OPS.150 Authorisation of high risk commercial specialised operations.....	261
AMC1 ARO.OPS.150 Authorisation of high risk commercial specialised operations.....	262
AMC1 ARO.OPS.150(a);(b) Authorisation of high risk commercial specialised operations.....	262
GM1 ARO.OPS.150(b) Authorisation of high risk commercial specialised operations.....	262
GM1 ARO.OPS.150(c) Authorisation of high risk commercial specialised operations.....	262
AMC1 ARO.OPS.150(f) Authorisation of high risk commercial specialised operations.....	263
GM1 ARO.OPS.150(f) Authorisation of high risk commercial specialised operations.....	263
ARO.OPS.155 Lease agreements.....	263
GM1 ARO.OPS.155 Lease agreements.....	263
GM2 ARO.OPS.155 Lease agreements.....	263
SECTION II – Approvals.....	264

ARO.OPS.200 Specific approval procedure	264
AMC1 ARO.OPS.200 Specific approval procedure	264
AMC2 ARO.OPS.200 SPECIFIC APPROVAL PROCEDURE	264
AMC3 ARO.OPS.200 Specific approval procedure	266
AMC4 ARO.OPS.200 Specific approval procedure	266
AMC5 ARO.OPS.200 Specific approval procedure	267
GM1 ARO.OPS.200 Specific approval procedure	268
GM2 ARO.OPS.200 Specific approval procedure	268
GM3 ARO.OPS.200 Specific approval procedure	268
GM4 ARO.OPS.200 Specific approval procedure	268
ARO.OPS.205 Minimum equipment list approval.....	268
GM1 ARO.OPS.205 Minimum equipment list approval	269
ARO.OPS.210 Determination of distance or local area.....	269
GM1 ARO.OPS.210 Determination of local area	269
ARO.OPS.215 Approval of helicopter operations over a hostile environment located outside a congested area	269
AMC1 ARO.OPS.215 Approval of helicopter operations over a hostile environment located outside a congested area	269
AMC2 ARO.OPS.215 Approval of helicopter operations over a hostile environment located outside a congested area	270
ARO.OPS.220 Approval of helicopter operations to or from a public interest site	270
AMC1 ARO.OPS.220 Approval of helicopter operations to or from a public interest site ...	270
AMC2 ARO.OPS.220 Approval of helicopter operations to or from a public interest site ...	270
ARO.OPS.225 Approval of fuel/energy schemes	271
AMC1 ARO.OPS.225 Approval of fuel/energy schemes	271
GM1 ARO.OPS.225 Approval of fuel/energy schemes	272
GM2 ARO.OPS.225 Approval of fuel/energy schemes	272
AMC1 ARO.OPS.225(c) Approval of fuel/energy schemes	273
AMC2 ARO.OPS.225(c) Approval of fuel/energy schemes	273
GM1 ARO.OPS.225(c) Approval of fuel/energy schemes	274
ARO.OPS.226 Approval and oversight of evidence-based training programmes	274
AMC1 ARO.OPS.226(a) Approval and oversight of evidence-based training programmes	275
GM1 ARO.OPS.226(a) Approval and oversight of evidence-based training programmes....	276
GM2 ARO.OPS.226(a) Approval and oversight of evidence-based training programmes..	277
AMC1 ARO.OPS.226(c) Approval and oversight of evidence-based training programmes	277
AMC2 ARO.OPS.226(c) Approval and oversight of evidence-based training programmes..	277
AMC1 ARO.OPS.226(d) Approval and oversight of evidence-based training programmes..	277
GM1 ARO.OPS.226(d) Approval and oversight of evidence-based training programmes ...	278
GM2 ARO.OPS.226(d) Approval and oversight of evidence-based training programmes ...	278
ARO.OPS.230 Determination of disruptive schedules	279
ARO.OPS.235 Approval of individual flight time specification schemes.....	279
GM1 ARO.OPS.235(b);(c) Approval of individual flight time specification schemes	279
ARO.OPS.240 Specific approval of RNP AR APCH	279
GM1 ARO.OPS.240 Specific approval of RNP AR APCH	280
GM2 ARO.OPS.240 Specific approval of RNP AR APCH	280
SECTION III – Oversight of operations	280
ARO.OPS.300 Introductory flights.....	280
AMC1 ARO.OPS.300 Introductory flights	280
GM1 ARO.OPS.300 Introductory flights	280
SUBPART RAMP: RAMP INSPECTIONS OF AIRCRAFT OF OPERATORS UNDER THE REGULATORY OVERSIGHT OF ANOTHER STATE.....	281
ARO.RAMP.005 Scope	281
GM1 ARO.RAMP.005 Scope	281
ARO.RAMP.100 General	281

AMC1 ARO.RAMP.100(b) General.....	282
AMC1 ARO.RAMP.100(c) General	282
ARO.RAMP.105 Prioritisation criteria.....	283
ARO.RAMP.106 Alcohol testing.....	284
AMC1 ARO.RAMP.106 Alcohol testing.....	284
GM1 ARO.RAMP.106 Alcohol testing.....	285
GM2 ARO.RAMP.106 Alcohol testing.....	286
GM3 ARO.RAMP.106 Alcohol testing.....	286
ARO.RAMP.110 Collection of information	286
AMC1 ARO.RAMP.110 Collection of information	286
ARO.RAMP.115 Qualification of ramp inspectors.....	287
AMC1 ARO.RAMP.115(a)(b) Qualification of ramp inspectors	288
AMC2 ARO.RAMP.115(a)(b) Qualification of ramp inspectors	288
AMC3 ARO.RAMP.115(a)(b) Qualification of ramp inspectors	289
AMC4 ARO.RAMP.115(a)(b) Qualification of ramp inspectors	289
AMC5 ARO.RAMP.115(a)(b) Qualification of ramp inspectors	290
AMC6 ARO.RAMP.115(a)(b) Qualification of ramp inspectors	290
AMC7 ARO.RAMP.115(a)(b) Qualification of ramp inspectors	291
AMC8 ARO.RAMP.115(a)(b) Qualification of ramp inspectors	291
ARO.RAMP.120 Approval of training organisations.....	292
AMC1 ARO.RAMP.120(a) Approval of training organisations.....	293
AMC2 ARO.RAMP.120(a) Approval of training organisations.....	293
AMC1 ARO.RAMP.120(a)(4) Approval of training organisations	294
ARO.RAMP.125 Conduct of ramp inspections	294
AMC1 ARO.RAMP.125 Conduct of Ramp Inspections & ARO.RAMP.130 Categorisation of findings	294
AMC1 ARO.RAMP.125(b) Conduct of ramp inspections.....	295
AMC1 ARO.RAMP.125(c) Conduct of ramp inspections	295
ARO.RAMP.130 Categorisation of findings	296
ARO.RAMP.135 Follow-up actions on findings.....	296
AMC1 ARO.RAMP.135(a) Follow-up actions on findings	297
AMC1 ARO.RAMP.135(b) Follow-up actions on findings	297
ARO.RAMP.140 Grounding of aircraft.....	298
ARO.RAMP.145 Reporting.....	298
AMC1 ARO.RAMP.145 Safety reports	299
ARO.RAMP.150 Agency coordination tasks	299
AMC1 ARO.RAMP.150(b)(4)(iii) Agency coordination tasks	300
ARO.RAMP.155 Annual report	300
ARO.RAMP.160 Information to the public and protection of information.....	300

ANNEX VII (Part-NCO) 1893

SUBPART A: GENERAL REQUIREMENTS 1893

NCO.GEN.100 Competent authority	1893
GM1 NCO.GEN.100(b) Competent authority.....	1893
NCO.GEN.101 Means of compliance.....	1893
NCO.GEN.103 Introductory flights	1893
NCO.GEN.104 Use of aircraft included in an AOC by an NCO operator	1894
AMC1 NCO.GEN.104 Use of aircraft included in an AOC by an NCO operator..	1894
GM1 NCO.GEN.104 Use of aircraft included in an AOC by an NCO operator....	1895
GM1 NCO.GEN.104(c) Use of aircraft included in an AOC by an NCO operator	1895
NCO.GEN.105 Pilot-in-command responsibilities and authority	1895
AMC1 NCO.GEN.105 Pilot-in-command responsibilities and authority	1897
AMC2 NCO.GEN.105 Pilot-in-command responsibilities and authority	1897
GM1 NCO.GEN.105 Pilot-in-command responsibilities and authority	1898
GM1 NCO.GEN.105(a)(8) Pilot-in-command responsibilities and authority.....	1898
AMC1 NCO.GEN.105(a)(3) Pilot-in-command responsibilities and authority....	1898

GM1 NCO.GEN.105(d) Pilot-in-command responsibilities and authority	1899
AMC1 NCO.GEN.105(e) Pilot-in-command responsibilities and authority	1899
NCO.GEN.110 Compliance with laws, regulations and procedure	1899
NCO.GEN.115 Taxiing of aeroplanes	1900
GM1 NCO.GEN.115 Taxiing of aeroplanes	1900
GM1 NCO.GEN.115(b)(4) Taxiing of aeroplanes	1900
NCO.GEN.120 Rotor engagement – helicopters	1901
GM1 NCO.GEN.120 Rotor engagement	1901
NCO.GEN.125 Portable electronic devices	1901
AMC1 NCO.GEN.125 Portable electronic devices (PEDs)	1901
AMC2 NCO.GEN.125 Portable electronic devices (PEDs)	1902
GM1 NCO.GEN.125 Portable electronic devices	1903
GM2 NCO.GEN.125 Portable electronic devices	1904
NCO.GEN.130 Information on emergency and survival equipment carried	1904
AMC1 NCO.GEN.130 Information on emergency and survival equipment carried	1904
NCO.GEN.135 Documents, manuals and information to be carried	1905
AMC1 NCO.GEN.135(a)(3) Documents, manuals and information to be carried	1905
AMC1 NCO.GEN.135(a)(10) Documents, manuals and information to be carried	1906
GM1 NCO.GEN.135 Documents, manuals and information to be carried	1906
GM1 NCO.GEN.135(a)(1) Documents, manuals and information to be carried	1906
GM1 NCO.GEN.135(a)(8) Documents, manuals and information to be carried	1907
GM1 NCO.GEN.135(a)(11) Documents, manuals and information to be carried	1907
GM1 NCO.GEN.135(a)(13) Documents, manuals and information to be carried	1907
NCO.GEN.140 Transport of dangerous goods	1907
GM1 NCO.GEN.140(a) Transport of dangerous goods	1908
AMC1 NCO.GEN.140(d) Transport of dangerous goods	1909
AMC1 NCO.GEN.140(f) Transport of dangerous goods	1911
GM1 NCO.GEN.140(f) Transport of dangerous goods	1911
NCO.GEN.145 Immediate reaction to a safety problem	1911
NCO.GEN.150 Journey log	1912
AMC1 NCO.GEN.150 Journey log	1912
NCO.GEN.155 Minimum equipment list	1912
AMC1 NCO.GEN.155 Minimum equipment list	1913
AMC2 NCO.GEN.155 Minimum equipment list	1914
AMC3 NCO.GEN.155 Minimum equipment list	1914
AMC4 NCO.GEN.155 Minimum equipment list	1914
AMC5 NCO.GEN.155 Minimum equipment list	1915
GM1 NCO.GEN.155 Minimum equipment list	1915
GM2 NCO.GEN.155 Minimum equipment list	1916
GM3 NCO.GEN.155 Minimum equipment list	1916
GM4 NCO.GEN.155 Minimum equipment list	1916

SUBPART B: OPERATIONAL PROCEDURES.....	1917
NCO.OP.100 Use of aerodromes and operating sites	1917
NCO.OP.101 Altimeter check and settings.....	1917
AMC1 NCO.OP.101(a) Altimeter check and settings	1917
NCO.OP.105.....	1917

RULE AMENDMENT STATUS

SUMMARY OF CHANGES — CORRECTION (DECEMBER 2022)

1. The **missing new GM1 CAT.OP.MPA.185 ‘Fuel/energy scheme — in-flight fuel/energy management policy — aeroplanes’**, as introduced by ED Decision 2022/005/R on fuel/energy management, was incorporated into the Easy Access Rules for Air Operations — Revision from November 2022.
2. The **introductory sentence of point CAT.GEN.MPA.210** of Annex IV (Part-CAT) to Commission Regulation (EU) No 965/2012, **as amended by Commission Implementing Regulation (EU) 2022/2203** of 11 November 2022 amending Regulation (EU) No 965/2012 as regards the applicability of the requirements for locating an aircraft in distress, was corrected.

SUMMARY OF CHANGES — REVISION 19 (NOVEMBER 2022)

1. Commission Implementing Regulation (EU) 2022/2203 of 11 November 2022 amending Regulation (EU) No 965/2012 as regards the applicability of the requirements for locating an aircraft in distress

amends:

— Annex IV (Part-CAT) to,

Regulation (EU) No 965/2012.

ICAO Standard 6.18.1 was incorporated into point CAT.GEN.MPA.210 of Annex IV (Part-CAT) to Commission Regulation (EU) No 965/2012 (2), which requires certain aeroplanes to be equipped with robust and automatic means to accurately determine, following an accident during which the aeroplane is severely damaged, the location of the point of end of flight.

The ICAO Council adopted Amendment 48 to ICAO Annex 6, Part I at the 16th Meeting of their 226th Session on 18 July 2022. That amendment postpones the applicability date of ICAO Standard 6.18.1 to 1 January 2025 and restricts its applicability to aeroplanes first issued with an individual Certificate of Airworthiness (CofA) on or after 1 January 2024.

That amendment intends (i) to address the significant delays, faced by all aircraft manufacturers concerned worldwide, in fitting aeroplanes with the required equipment, and setting up the necessary communication infrastructure between all relevant stakeholders (including air traffic service (ATS) providers and rescue coordination centres (RCCs)); and (ii) to provide more time for RCCs and ATS units to prepare and adapt their procedures.

The amendment shall become **applicable from 4 December 2022**.

Date of publication in the Official Journal: 14 November 2022.

Date of entry into force of Regulation (EU) 2022/2203: on the twentieth day following that of its publication in the Official Journal of the European Union: 4 December 2022

REVISION TABLE (IRs)

AIR OPS RULES AMENDED BY IMPLEMENTING REGULATION (EU) 2022/2203

Part, subpart, article, rule	Action	EDD Issue/ Amdt. no	Amended by Commission Regulation
Annex IV (Part-CAT)			
CAT.GEN.MPA.210	Changed	N/a	Regulation (EU) 2022/2203

2. EASA Executive Director Decision 2022/017/R of 2 September 2022 issues:

— Amendment 22 to Issue 2 of the Acceptable Means of Compliance and Guidance Material to Annex III (Part-ORO)

to **Regulation (EU) No 965/2012** to facilitate the implementation of the new requirements introduced by Regulation (EU) 2022/410, which amended Regulation (EU) No 1321/2014 ('Continuing Airworthiness (CAW) Regulation') as regards the CAW management in a single air carrier business grouping.

This Decision amends the Acceptable Means of Compliance (AMC) & Guidance Material (GM) to Annex I (Part M) and Annex Vc (Part-CAMO) to the CAW Regulation, as well as the AMC & GM to Annex III (Part-ORO) to Regulation (EU) No 965/2012 ('Air OPS Regulation') regarding the following topics:

- definition of a 'single air carrier business grouping';
- harmonisation of the management systems of the organisations involved;
- cooperation in the oversight by competent authorities (CAs) of the organisations involved; and
- nomination by the operator of the person responsible for the management and supervision of the contract with a CAMO.

The new AMC and GM shall become **applicable from 3 September 2022**.

Date of publication of ED Decision 2022/017/R in the Official Publication of EASA: 2 September 2022.

Date of entry into force of ED Decision 2022/017/R: on the day following that of its publication in the Official Publication of EASA: 3 September 2022.

REVISION TABLE (IRs)

AIR OPS RULES AMENDED BY ED DECISION 2022/017/R

Part, subpart, article, rule	Action	EDD Issue/ Amdt. no	Amended by EASA ED Decision
Annex III (Part-ORO)			
GM2 ORO.AOC.135(a)	Changed	Issue 2, Amdt 22	ED Decision 2022/017/R
AMC1 ORO.AOC.135(a)(4)	New	Issue 2, Amdt 22	ED Decision 2022/017/R
GM1 ORO.AOC.135(a)(4)	New	Issue 2, Amdt 22	ED Decision 2022/017/R

3. EASA Executive Director Decision 2022/014/R of 18 August 2022 issues:

- Amendment 21 to Issue 2 of the Acceptable Means of Compliance and Guidance Material to Annex III (Part-ORO);
- Amendment 22 to Issue 2 of the Acceptable Means of Compliance and Guidance Material to Annex IV (Part-CAT);
- Amendment 13 to Issue 1 of the Acceptable Means of Compliance and Guidance Material to Annex V (Part-SPA);
- Amendment 17 to Issue 1 of the Acceptable Means of Compliance and Guidance Material to Annex VI (Part-NCC);
- Amendment 14 to Issue 2 of the Acceptable Means of Compliance and Guidance Material to Annex VII (Part-NCO); and
- Amendment 17 to Issue 1 of the Acceptable Means of Compliance and Guidance Material to Annex VIII (Part-SPO)

to **Regulation (EU) No 965/2012** to facilitate the implementation of the new requirements related to flight crew training introduced into Regulation (EU) No 965/2012 (the 'Air OPS Regulation') by Commission Implementing Regulation (EU) 2021/2237 and into Regulation (EU) No 1178/2011 (the 'Aircrew Regulation') by Commission Implementing Regulation (EU)

2021/2227. Those Regulations and this ED Decision amend the operator's flight crew training and checking provisions to better reflect the increased complexity in the aviation system. The updates cover aeroplanes and helicopters that carry out commercial air transport (CAT) operations, specialised operations (SPO) and non-commercial operations with complex motor-powered aircraft (NCC).

The most important items are:

- new conditions for multi-pilot operations in single-pilot certified helicopters;
- new provisions for initial training and checking under SPO;
- new provisions for recurrent training and checking under CAT and SPO;
- new conditions for the operation on different aircraft types or variants;
- introduction of the option for NCC operators to accept previous training and checking; and
- addressing other minor issues regarding flight crew training and checking.

Some changes are expected to increase safety in a cost-effective way, whereas others should reduce the training costs without an impact on safety. Several clarifications are also introduced to maintain a high level of safety for air operations by ensuring a harmonised implementation of the Air OPS and the Aircrew Regulations.

The new AMC and GM shall become **applicable from 30 October 2022 except for the following provisions, which will apply from 26 March 2023:**

- AMC2 ORO.FC.105(b)(2);(c),
- GM2 ORO.FC.105(b)(2),
- AMC1 ORO.FC.105(b)(3),
- AMC1 ORO.FC.115,
- AMC1 ORO.FC.120,
- AMC3 ORO.FC.120,
- AMC1 ORO.FC.125(b),
- AMC1 ORO.FC.130,
- AMC1 ORO.FC.135,
- AMC1 ORO.FC.145(a),
- GM1 ORO.FC.145(a),
- AMC2 ORO.FC.145(d),
- GM1 ORO.FC.145(d),
- AMC2 ORO.FC.146,
- AMC1 ORO.FC.215,
- AMC1 ORO.FC.220,
- AMC3 ORO.FC.220,
- AMC1 ORO.FC.230,

- AMC3 ORO.FC.230,
- GM1 ORO.FC.230,
- AMC1 ORO.FC.A.245,
- AMC1 ORO.FC.A.245(d);(e)(2),
- AMC1 ORO.FC.320,
- AMC1 ORO.FC.325,
- AMC1 ORO.FC.330,
- GM1 ORO.FC.330, and
- AMC1 ORO.CC.115(e).

Date of publication of ED Decision 2022/014/R in the Official Publication of EASA: 19 August 2022.

Date of entry into force of ED Decision 2022/014/R: on the day following that of its publication in the Official Publication of EASA: 20 August 2022.

4. EASA Executive Director Decision 2022/012/R of 30 June 2022 issues:

- Amendment 16 to Issue 1 of the Guidance Material to Annex I (Definitions for terms used in Annexes II to VIII);
- Amendment 13 to Issue 3 of the Acceptable Means of Compliance and Guidance Material to Annex II (Part-ARO);
- Amendment 20 to Issue 2 of the Acceptable Means of Compliance and Guidance Material to Annex III (Part-ORO);
- Amendment 21 to Issue 2 of the Acceptable Means of Compliance and Guidance Material to Annex IV (Part-CAT);
- Amendment 12 to Issue 1 of the Acceptable Means of Compliance and Guidance Material to Annex V (Part-SPA);
- Amendment 16 to Issue 1 of the Acceptable Means of Compliance and Guidance Material to Annex VI (Part-NCC);
- Amendment 13 to Issue 2 of the Acceptable Means of Compliance and Guidance Material to Annex VII (Part-NCO); and
- Amendment 16 to Issue 1 of the Acceptable Means of Compliance and Guidance Material to Annex VIII (Part-SPO)

to **Regulation (EU) No 965/2012** to facilitate the implementation of the new requirements introduced into Regulation (EU) No 965/2012 (the 'Air OPS Regulation') related to all-weather operations (AWOs) by Commission Implementing Regulation (EU) 2021/2237 (the 'AWO Regulation').

The AWO Regulation, which will apply from 30 October 2022, includes elements from two different areas: all-weather operations and operator flight crew training.

The AWO Regulation introduced a performance-based, ‘technology-neutral’ approach to the regulation of AWOs, which aims to facilitate a better integration and use of new, advanced technologies as well as new operational procedures to support AWOs and to ensure the availability of aerodrome infrastructure, information, and procedures to support AWOs. The new AMC and GM shall become **applicable from 30 October 2022**.

Date of publication of ED Decision 2022/012/R in the Official Publication of EASA: 30 June 2022.

Date of entry into force of ED Decision 2022/012/R: 1 July 2022.

AMC1 SPO.IDE.H.125(c)	New	Issue 1, Amdt 16	ED Decision 2022/012/R

SUMMARY OF CHANGES — REVISION 18 (MAY 2022)

EASA Executive Director Decision 2022/005/R of 22 March 2022 issues:

- Amendment 15 to Issue 1 of the Guidance Material to Annex I (Definitions for terms used in Annexes II to VIII);
- Amendment 12 to Issue 3 of the Acceptable Means of Compliance and Guidance Material to Annex II (Part-ARO);
- Amendment 19 to Issue 2 of the Acceptable Means of Compliance and Guidance Material to Annex III (Part-ORO);
- Amendment 20 to Issue 2 of the Acceptable Means of Compliance and Guidance Material to Annex IV (Part-CAT);
- Amendment 11 to Issue 1 of the Acceptable Means of Compliance and Guidance Material to Annex V (Part-SPA);
- Amendment 15 to Issue 1 of the Acceptable Means of Compliance and Guidance Material to Annex VI (Part-NCC);
- Amendment 12 to Issue 2 of the Acceptable Means of Compliance and Guidance Material to Annex VII (Part-NCO); and
- Amendment 15 to Issue 1 of the Acceptable Means of Compliance and Guidance Material to Annex VIII (Part-SPO)

to **Regulation (EU) No 965/2012** to facilitate the implementation of the new requirements on fuel/energy planning and management, particularly those regarding the development and oversight of the air operators' fuel schemes, introduced into Regulation (EU) No 965/2012 (the 'Air OPS Regulation') by Commission Implementing Regulation (EU) 2021/1296. The new AMC and GM on fuel schemes, which consider the robustness of the operators' management system and are structured around three levels of performance, allowing operators to increase operational efficiency, with both cost-efficiency and environmental benefits, shall become **applicable from 30 October 2022**.

Date of publication of ED Decision 2022/005/R in the Official Publication of EASA: 25 March 2022.

Date of entry into force of ED Decision 2022/005/R: on the day following that of its publication in the Official Publication of EASA: 26 March 2022

REVISION TABLE (IRs)

AIR OPS RULES AMENDED BY ED DECISION 2022/005/R

Part, subpart, article, rule	Action	EDD Issue/ Amdt. no	Amended by Commission Regulation
Annex I (Definitions)			
GM2 Annex I	Changed	Issue 1, Amdt 15	ED Decision 2022/005/R
GM28 Annex I	New	Issue 1, Amdt 15	ED Decision 2022/005/R
GM29 Annex I	New	Issue 1, Amdt 15	ED Decision 2022/005/R
GM30 Annex I	New	Issue 1, Amdt 15	ED Decision 2022/005/R

Annex II (Part-ARO)

AMC1 ARO.OPS.225	New	Issue 3, Amdt 12	ED Decision 2022/005/R
GM1 ARO.OPS.225	Changed	Issue 3, Amdt 12	ED Decision 2022/005/R
GM2 ARO.OPS.225	New	Issue 3, Amdt 12	ED Decision 2022/005/R
AMC1 ARO.OPS.225(c)	New	Issue 3, Amdt 12	ED Decision 2022/005/R
AMC2 ARO.OPS.225(c)	New	Issue 3, Amdt 12	ED Decision 2022/005/R
GM1 ARO.OPS.225(c)	New	Issue 3, Amdt 12	ED Decision 2022/005/R

Annex III (Part-ORO)

GM1 ORO.GEN.110(c)	Changed	Issue 2, Amdt 19	ED Decision 2022/005/R
AMC1 ORO.GEN.110(c)&(e)	New	Issue 2, Amdt 19	ED Decision 2022/005/R
AMC2 ORO.GEN.110(f)	New	Issue 2, Amdt 19	ED Decision 2022/005/R
GM2 ORO.GEN.110(f)	New	Issue 2, Amdt 19	ED Decision 2022/005/R
GM1 ORO.GEN.130(b)	Changed	Issue 2, Amdt 19	ED Decision 2022/005/R
AMC3 ORO.MLR.100	Changed	Issue 2, Amdt 19	ED Decision 2022/005/R

Annex IV (Part-CAT)

AMC1 CAT.GEN.MPA.180(a)(18)	New	Issue 2, Amdt 20	ED Decision 2022/005/R
GM1 CAT.GEN.MPA.180(a)(18)	New	Issue 2, Amdt 20	ED Decision 2022/005/R
GM2 CAT.GEN.MPA.180(a)(18)	New	Issue 2, Amdt 20	ED Decision 2022/005/R
GM3 CAT.GEN.MPA.180(a)(18)	New	Issue 2, Amdt 20	ED Decision 2022/005/R

SUMMARY OF CHANGES – REVISION 17 (FEBRUARY 2022)

1. Commission Implementing Regulation (EU) 2021/2237 of 15 December 2021 amending Regulation (EU) No 965/2012 as regards the requirements for all-weather operations and for flight crew training and checking

amends:

- Article 5(2), point (a)(iv) of,
- Annex I (Definitions),
- Annex II (Part-ARO),
- Annex III (Part-ORO),
- Annex IV (Part-CAT),
- Annex V (Part-SPA),
- Annex VI (Part-NCC),
- Annex VII (Part-NCO), and
- Annex VIII (Part-SPO) to,

Regulation (EU) No 965/2012 to reflect recent technological advancements in new airborne systems and best practices in the domain of air operations, allow for a level playing field for all actors in the EU market, improve safety in a cost-effective way, and seek the use of innovative training tools. The amendments shall become **applicable from 30 October 2022**.

Date of publication in the Official Journal: 16 December 2021.

Date of entry into force of Regulation (EU) 2021/2237: on the twentieth day following that of its publication in the Official Journal of the European Union: 5 January 2022

2. Revision 17 also corrects the following errors identified in Revision 16:

- in the tables of **AMC4 ORO.FC.232 EBT programme assessment and training topics** and **AMC6 ORO.FC.232 EBT programme assessment and training topics**, the width of some cells was adjusted to allow all content to be visible;
- in **AMC1 CAT.IDE.A.225 Emergency medical kit**, point b(1)(v) was removed, as per **ED Decision 2021/005/R** amending **ED Decision 2014/015/R**; and
- in point **SPO.POL.146 Performance and operating criteria – helicopters**, the erroneously amended point (a)(1) was restored to its correct version, which was introduced by **Commission Regulation (EU) No 379/2014** amending **Commission Regulation (EU) No 965/2012**.

SUMMARY OF CHANGES – REVISION 16 (DECEMBER 2021)

Commission Implementing Regulation (EU) 2021/1296 of 4 August 2021 amending and correcting Regulation (EU) No 965/2012 as regards the requirements for fuel/energy planning and management, and as regards requirements on support programmes and psychological assessment of flight crew, as well as testing of psychoactive substances

amends the second paragraph of Article 9b of **Regulation (EU) No 965/2012** by deferring the applicability date of EASA's obligation to produce a first report on the results of its review of the effectiveness of the provisions concerning support programmes, as well as the psychological assessment of flight crew and the systematic and random testing of psychoactive substances to ensure the medical fitness of flight crew and cabin crew members set out in Annex II (Part-ARO) and Annex IV (Part-CAT) to **Regulation (EU) No 965/2012**.

In this regard, **Regulation (EU) 2021/1296** reintroduces into Annex I (Definitions) to **Regulation (EU) No 965/2012** definition 98(a) that defined the term 'psychoactive substances'. That definition is essential for the consistent interpretation of the provisions introduced by **Regulation (EU) 2018/1042** and for clearly defining which substances are subject to those provisions and which are not. Therefore, to safeguard legitimate expectations of the persons subject to those provisions, that definition was reintroduced with effect from the applicability date (**14 February 2021**) of the related changes introduced by **Regulation (EU) 2018/1042**.

The amendments introduced by **Regulation (EU) 2021/1296** to the Cover Regulation and Annexes I-VII to **Regulation (EU) No 965/2012** regarding the requirements for fuel/energy planning and management shall apply from **30 October 2022**.

Date of publication in the Official Journal: 5 August 2021.

Date of entry into force of Regulation (EU) 2021/1296: on the twentieth day following that of its publication in the Official Journal of the European Union: 25 August 2021

SUMMARY OF CHANGES – REVISION 15 (JUNE 2021)

1. **Commission Implementing Regulation (EU) 2020/745 of 4 June 2020 amending Regulation (EU) 2018/1042 as regards postponing dates of application of certain measures in the context of the COVID-19 pandemic**

amends Article 2 of Regulation (EU) 2018/1042, the third paragraph, by deferring the date of application of points 1 and 3 of Article 1 of Reg. (EU) 2018/1042 from 14 August 2020 to 14 February 2021, with the exception of points 3(f) and 6(b) of the Annex to Reg. (EU) 2018/1042 (related to TAWS), which shall apply from 14 August 2018.

This means that the following points will become applicable as of 12 February 2021 instead of 14 August 2020:

- Article 4 ‘Ramp inspections’;
- Annex I (Definitions): Definitions 78a, 98a, 105a;
- Annex II (Part-ARO): ARO.RAMP.106;
- Annex IV (Part-CAT): CAT.GEN.MPA.100 point (c)(1); CAT.GEN.MPA.170; CAT.GEN.MPA.175; CAT.GEN.MPA.215; CAT.GEN.MPA.100 point (b)(1);
- Annex VI (Part-NCC): NCC.GEN.105 point (e)(2);
- Annex VII (Part-NCO): NCO.SPEC.115 point (e)(2);
- Annex VIII (Part-SPO): SPO.GEN.105 point (e)(2).

Article 1 point (2) of Reg. (EU) 2018/1042, which introduces changes to Article 9b ‘Review’ of Reg. (EU) No 965/2012, shall apply from 14 August 2020. It is not affected by the deferred date of application introduced by Reg. (EU) 2020/745.

Date of publication in the Official Journal: 5 June 2020.

Date of entry into force of Reg. (EU) 2020/745: on the day following that of its publication in the Official Journal of the EU.

2. **Commission Implementing Regulation (EU) 2020/1176 of 7 August 2020 amending Implementing Regulation (EU) 2019/1387 as regards postponing dates of application of certain measures in the context of the COVID-19 pandemic**

amends Article 2 of Reg. (EU) 2019/1387, the third paragraph, by deferring its date of application from 5 November 2020 to 12 August 2021.

This affects the amendments introduced by Reg. (EU) 2019/1387 related to the global reporting format for aeroplane performance in Annex IV (Part-CAT).

The following points of point (4) of the Annex to Reg. (EU) 2019/1387 shall apply from 12 August 2021 instead of 5 November 2020:

- point (c). This is CAT.OP.MPA.300;
- point (d). This is CAT.OP.MPA.301;
- point (e). This is CAT.OP.MPA.303;
- point (f). This is CAT.OP.MPA.311;
- point (g). This is CAT.POL.A.105 point (d);

- point (n). This is CAT.POL.A.255;
- point (q). This is CAT.POL.A.355.

Date of publication in the Official Journal: 10 August 2020.

Date of entry into force of Reg. (EU) 2020/1176: on the day following that of its publication in the Official Journal of the EU.

3. Commission Implementing Regulation (EU) 2020/2036 of 9 December 2020 amending Regulation (EU) No 965/2012 as regards the requirements for flight crew competence and training methods and postponing dates of application of certain measures in the context of the COVID-19 pandemic

This amendment aligns the EU rules with ICAO Doc 9995 ‘Manual of evidence-based training’ (EBT) and introduces requirements on the provision of training, checking and assessment of the EBT programme and to allow authorities to approve the baseline EBT, which replaces previous checks such as operator proficiency checks and licence proficiency checks.

The following Annexes are affected:

- Annex I – Definitions
- Annex II – Part-ARO
- Annex III – Part-ORO, Subpart ORO.FC.

This amendment also defers the date of application of the requirements that cockpit voice recorders (CVR) with a recording capability of 25 hours are installed and used as of 1 January 2021.

This means that the following points will be applicable from 1 January 2022 instead of 1 January 2021:

- CAT.IDE.A.185 (c)(1)
- NCC.IDE.A.160 (b)(1)
- SPO.IDE.A.140 (b)(1)

Date of publication in the Official Journal: 11 December 2020.

Date of entry into force of Reg. (EU) 2020/2036: on the twentieth day following that of its publication in the Official Journal of the EU.

4. EASA ED Decision 2019/025/R of 17 December 2019 amending ED Decision 2018/006/R of 3 May 2018 issuing the Certification Specifications for Aeroplane Flight Simulation Training Devices, as well as amending ED Decisions 2014/017/R of 24 April 2014 and 2019/005/R of 27 February 2019 on the Acceptable Means of Compliance and Guidance Material to Annex III (Part-ORO) to Commission Regulation (EU) No 965/2012

affects the following document in the air operations domain:

- AMC & GM to Part-ORO — Issue 2, Amendment 16

Date of publication in the EASA Official Publication: 16 December 2019

Date of entry into force of Decision 2019/025/R: 17 December 2019

Article 3 of this Decision (i.e. changes made to the AMC&GM to Part-ORO) become applicable from 20 August 2020.

5. EASA ED Decision 2020/013/R of 18 August 2020 amending ED Decision 2019/025/R amending ED Decision 2018/006/R of 3 May 2018 issuing the Certification Specifications for Aeroplane Flight Simulation Training Devices, as well as amending ED Decisions 2014/017/R of 24 April 2014 and 2019/005/R of 27 February 2019 on the Acceptable Means of Compliance and Guidance Material to Annex III (Part-ORO) to Commission Regulation (EU) No 965/2012

This Decision introduces an amendment to ED Decision 2019/025/R — AMC & GM to Part-ORO Issue 2, Amendment 16 ‘Deferment of the use of aeroplane flight simulation training devices (FSTDs) qualified against “CS-FSTD(A) Issue 2” in air operator upset prevention and recovery training (UPRT) in relation to the COVID-19 pandemic’

The Decision amends Article 4 of EDD 2019/025/R by deferring the application of changes made to AMC & GM to Part-ORO (specified in Article 3 of EDD 2019/025/R) from 20 August 2020 to 31 March 2021. This is related to the use of aeroplane flight simulation training devices (FSTDs) qualified against CS-FSTD(A) Issue 2 in air operator upset prevention and recovery training (UPRT).

The following AMC and GM are affected and will become applicable from 31 March 2020 instead of 20 August 2020:

- AMC1 ORO.FC.220&230 point (d);
- AMC2 ORO.FC.220&230 point (d);
- GM3 ORO.FC.220&230.

Date of publication in the EASA Official Publication: 18 August 2020

Date of entry into force of Decision 2020/013/R: 19 August 2020

Changes made to AMC&GM to Part-ORO become applicable from 31 March 2021.

6. EASA ED Decision 2021/002/R

This Decision is related to Reg. (EU) 2020/2036 on flight crew competence and training methods, which amends Regulation (EU) No 965/2012 on air operations. The AMC and GM will facilitate the implementation of the new requirements on evidence-based training.

(related Regulation in the aircrew domain: Commission Implementing Regulation (EU) 2020/2193 amending Reg. (EU) No 1178/2011)

The Decision and the related Regulations are parts of a global safety initiative endorsed by ICAO, whose objective is to determine the relevance of the existing pilot training according to aircraft generation. In particular, they constitute a second step in the context of European Union rulemaking actions to implement EBT. The first step was completed in 2015 with the publication of ED Decision 2015/027/R that provided guidance material to allow the implementation of a ‘mixed EBT’ which maintains the current operator proficiency check (OPC) and licence proficiency check (LPC). This Decision completes the second step initiated by the Regulations that amended Reg. (EU) No 965/2012 (Air OPS Regulation) and Reg. (EU) No 1178/2011 (Aircrew Regulation) to allow authorities to approve the baseline EBT, which replaces OPC and LPC. This will allow a single philosophy of recurrent training within the airline. EBT is intended to improve

safety by enhancing the capability of flight crews to operate the aircraft in all flight regimes by recognising and managing unexpected situations. The EBT concept is designed to maximise learning and minimise formal checking.

The following AMC and GM related to Reg. (EU) 2020/2036 which amends Reg. (EU) No 965/2012 are affected by this Decision:

- AMC and GM to Annex I Definitions (Issue 1, amendment 12)
- AMC and GM to Annex II (Part-ARO) (Issue 3, amendment 11)
- AMC and GM to Annex III (Part-ORO) (Issue 2, amendment 17)

For information, the following AMC and GM related to Reg. (EU) 2020/2193 which amends Reg. (EU) No 1178/2011 are affected by this Decision:

- AMC and GM to Annex I (Part-FCL) (Issue 1, amendment 11)
- AMC and GM to Annex VI (Part-ARA) (Issue 1, amendment 11)

Date of publication in the EASA Official Publication: 2 March 2021

Date of entry into force of Decision 2021/002/R: 3 March 2021

7. ED Decision 2021/005/R

Update of the Acceptable Means of Compliance and Guidance Material to Regulation (EU) No 965/2012 - Aeroplane performance, PBS, oxygen equipment, medical equipment, recorders, technical records, non-ETOPS operations, ground de-icing/anti-icing procedures

Following the adoption of Regulation (EU) 2019/1387, amending Regulation (EU) No 965/2012 (Air OPS Regulation), the objective of this Decision is to support the implementation of the requirements on:

- power supply to cockpit voice recorders (CVRs) in order to improve the availability of recordings;
- in-flight recording for light aircraft;
- commercial operation of certain categories of aeroplanes without an ETOPS approval;
- runway surface condition reporting and in-flight assessment of landing performance;
- reduced required landing distance for certain categories of commercially operated aeroplanes;
- operations in airspaces where performance-based communication and surveillance (PBCS) is implemented;
- new technical standards on first-aid oxygen dispensing units, medical equipment, de-icing/anti-icing ground
- procedures; and
- technical records.

This Decision amends as necessary the acceptable means of compliance and guidance material in relation to the above-listed topics.

The following Annexes are affected:

- ‘GM to Annex I (Definitions for terms used in Annexes II to VIII) — Issue 1, Amendment 13’
- ‘AMC & GM to Part-ORO — Issue 2, Amendment 18’
- ‘AMC & GM to Part-CAT — Issue 2, Amendment 18’
- ‘AMC & GM to Part-SPA — Issue 1, Amendment 9’
- ‘AMC & GM to Part-NCC — Initial issue, Amendment 13’
- ‘AMC & GM to Part-NCO — Issue 2, Amendment 10’
- ‘AMC & GM to Part-SPO — Initial issue, Amendment 13’

The following AMC and GM shall apply from 12 August 2021:

- CAT.OP.MPA.300
- CAT.OP.MPA.301
- CAT.OP.MPA.303
- CAT.OP.MPA.311
- CAT.POL.A.255
- CAT.POL.A.355

Date of publication in the EASA Official Publication: 23 April 2021

Date of entry into force of Decision 2021/005/R: 24 April 2021

8. ED Decision 2021/008/R

Amendment of requirements for flight recorders and underwater locating devices — Certification specifications, acceptable means of compliance, and guidance material for locating an aircraft in distress.

The objective of this Decision is to facilitate the implementation of point CAT.GEN.MPA.210 ‘Location of an aircraft in distress — Aeroplanes’ of Annex IV (Part-CAT) to Regulation (EU) No 965/2012 (‘Air OPS Regulation’).

This Decision amends certification specifications (CSs), acceptable means of compliance (AMC), and guidance material (GM), to support the implementation of point CAT.GEN.MPA.210. The scope of this Decision includes air operations (Air OPS), initial airworthiness (IAW), and air traffic management (ATM).

The amendments are expected to increase safety as they will facilitate locating an accident scene. This will increase the chances of rescuing accident survivors, and accelerate the collection of evidence that is necessary for determining the accident causes. In addition, these amendments are expected to ensure consistency with the existing requirements on flight recorders, emergency locator transmitters (ELTs), and low-frequency (8.8 kHz) underwater locating devices (ULDs).

Date of publication in the EASA Official Publication: 31 May 2021

Date of entry into force of Decision 2021/005/R: 1 June 2021

REVISION TABLE (IR, AMC, GM)

AIR OPS RULES AMENDED BY REG. (EU) 2020/745, (EU) 2020/2036 AND EDD 2021/002/R

SUMMARY OF CHANGES – REVISION 14 (OCTOBER 2019)

EASY ACCESS RULES FOR AIR OPERATIONS

1. EASA ED Decision 2019/019/R related to Regulation (EU) 2019/1384 amending Regulation (EU) No 965/2012 on air operations, containing an update of the air operations rules and maintenance check flights

affects the following documents:

- GM to Cover Regulation (Article 2(1)(d)), issue 1 amendment 3
- GM to Annex I (Definitions), issue 1 amendment 11
- AMC&GM to Annex II (Part-ARO), issue 3 amendment 10
- AMC&GM to Annex III (Part-ORO), issue 2, amendment 15
- AMC&GM to Annex IV (Part-CAT), issue 2 amendment 17
- AMC&GM to Annex V (Part-SPA), issue 1 amendment 8
- AMC&GM to Annex VI (Part-NCC), initial issue, amendment 12
- AMC&GM to Annex VII (Part-NCO), issue 2, amendment 9
- AMC&GM to Annex VIII (Part-SPO), initial issue, amendment 12

Date of publication in the EASA Official Publication: 17 September 2019.

Date of entry into force: on the day following that of its publication in the Official Publication of EASA.

REVISION TABLE (IR, AMC, GM)

AIR OPS RULES AMENDED WITH REVISION 14 – OCTOBER 2019

**ED Decision 2019/019/R containing AMC&GM related to
Commission Regulation (EU) 2019/1384**

Part, subpart, article, rule	Action	EDD Issue/ Amdt. no	Amended by Commission Regulation / EASA ED Decision
Cover regulation			
GM1 Art. 2(1)(d)	New	1/3	EDD 2019/019/R
GM1 Art. 3(5)(e)	New	1/3	EDD 2019/019/R
Annex I (Definitions)			
GM17 Annex I	New	1/11	EDD 2019/019/R
GM18 Annex I	New	1/11	EDD 2019/019/R
Annex II (Part-ARO)			
GM1 ARO.GEN.205	Deleted	3/10	EDD 2019/019/R
AMC2 ARO.GEN.305(b)	Changed	3/10	EDD 2019/019/R
AMC1 ARO.GEN.330	Changed	3/10	EDD 2019/019/R

GM1 SPO.SPEC.MCF.115 and SPO.SPEC.MCF.120	New	1/12	EDD 2019/019/R
AMC1 SPO.SPEC.MCF.120	New	1/12	EDD 2019/019/R
AMC2 SPO.SPEC.MCF.120	New	1/12	EDD 2019/019/R
GM1 SPO.SPEC.MCF.125	New	1/12	EDD 2019/019/R

SUMMARY OF CHANGES – REVISION 13 (SEPTEMBER 2019)

EASY ACCESS RULES FOR AIR OPERATIONS

1. **Commission Implementing Regulation (EU) 2019/1384 of 24 July 2019 amending Regulation (EU) No 965/2012 as regards the use of aircraft listed on an air operator certificate for non-commercial operations and specialised operations, the establishment of operational requirements for the conduct of maintenance check flights, the establishment of rules on non-commercial operations with reduced cabin crew on board and introducing editorial updates concerning air operations requirements**

affects the Cover Regulation (Articles 2, 6 and 9aa) and the following Annexes to Reg. (EU) 965/2012:

- Annex I – Definitions
- Annex II – Part-ARO
- Annex III – Part-ORO
- Annex IV – Part-CAT
- Annex V – Part-SPA
- Annex VI – Part-NCC
- Annex VII – Part-NCO
- Annex VIII – Part-SPO

This regulation introduces, among others, new requirements for maintenance check flights, a new definition of emergency exits, and a regulatory framework to allow the use of aircraft registered on an AOC by other operators for other-than-CAT operations, and as a result, proposes an amendment to Part-M of Regulation (EU) No 1321/2014.

Date of publication in the Official Journal: 4 September 2019.

Date of entry into force of Reg. (EU) 2019/1384: on the 20th day following that of its publication in the Official Journal of the EU.

2. **Commission Implementing Regulation (EU) 2019/1387 of 1 August 2019 as regards requirements for aeroplane landing performance calculations and the standards for assessing the runway surface conditions, update on certain aircraft safety equipment and requirements and operations without holding an extended range operational approval**

affects the Cover Regulation (Article 9aa) and the following Annexes to Reg. (EU) No 965/2012:

- Annex I – Definitions
- Annex II – Part-ARO
- Annex III – Part-ORO
- Annex IV – Part-CAT
- Annex V – Part-SPA
- Annex VI – Part-NCC

- Annex VII – Part-NCO
- Annex VIII – Part-SPO

This regulation mandates the carriage of lightweight flight recorders for certain categories of light aircraft that are commercially operated (CAT and SPO). The current mass threshold for ‘non-ETOPS’ operations is removed, as well as the type design requirement for the 120–180-minute non-ETOPS operations with turbojet aeroplanes, and the mass limit requiring a reinforced cockpit door for certain categories of aeroplanes is increased.

The regulation requires the installation of an alternate power supply of the CVRs and associated cockpit-mounted area microphone installed on certain large aeroplanes.

This regulation also introduces standards for runway surface condition reporting, landing performance at time of arrival as well as a reduced required landing distance for CAT operations with certain categories of aeroplanes.

Date of publication in the Official Journal: 5 September 2019.

Date of entry into force of Reg. (EU) 2019/1387: on the 20th day following that of its publication in the Official Journal of the EU.

The following points of the Annex, addressing flight recorders for light aircraft, shall apply from 25 September 2019:

- Point (4)(a)
- Point (6)(b)
- Point (8)(b)

The following points of point (4) of the Annex, addressing runway performance, shall apply from 5 November 2020:

- Point (c)
- Point (d)
- Point (e)
- Point (f)
- Point (g)
- Point (n)
- Point (q).

REVISION TABLE (IR, AMC, GM)

AIR OPS RULES AMENDED WITH REVISION 13 – SEPTEMBER 2019

Part, subpart, article, rule	Action	EDD Issue/ Amdt. no	Amended by Commission Regulation / EASA ED Decision
Cover regulation			
Article 2, pt. 7	Changed		Reg. (EU) 2019/1384
Article 6(3)	Changed		Reg. (EU) 2019/1384

Part, subpart, article, rule	Action	EDD Issue/ Amdt. no	Amended by Commission Regulation / EASA ED Decision
Article 9aa	New		Reg. (EU) 2019/1384
Article 9aa	Changed		Reg. (EU) 2019/1387

SUMMARY OF CHANGES – REVISION 12 (MARCH 2019)

1. **Commission Implementing Regulation (EU) 2018/1975 of 14 December 2018 amending Regulation (EU) No 965/2012 as regards air operations requirements for sailplanes and electronic flight bags**

affects the Cover Regulation (Articles 1, 2, 5, 6 and 10) and the following Annexes to Reg. (EU) 965/2012:

- Annex I – Definitions
- Annex II – Part-ARO
- Annex III – Part-ORO
- Annex IV – Part-CAT
- Annex V – Part-SPA
- Annex VI – Part-NCC
- Annex VII – Part-NCO
- Annex VIII – Part-SPO

Date of publication in the Official Journal: 20 December 2018.

Date of application of Reg. (EU) 2018/1975: 9 July 2019.

2. **EASA ED Decision 2018/012/R related to Regulation (EU) 2018/1042 amending regulation (EU) No 965/2012 on air operations, containing requirements on aircrew medical fitness**

affects the following documents:

- GM to Cover Regulation (Article 4.3), issue 1 amendment 2
- AMC and GM to Annex II Part-ARO, issue 3 amendment 8
- AMC and GM to Annex IV Part-CAT, issue 2 amendment 15

Date of publication in the EASA Official Publication: 22 November 2018.

Date of application of EDD 2018/012/R: 14 August 2020.

3. **EASA ED Decision 2019/005/R related to Reg. (EU) 2018/1974 amending Reg. (EU) No 1178/2011 on aircrew, containing new requirements on loss of control prevention and recovery training (UPRT)**

affects the following documents:

- GM to Annex I (Definitions), issue 1 amendment 8
- AMC and GM to Annex III (Part-ORO), issue 2 amendment 13

Date of publication in the EASA Official Publication: 27 Feb. 2019.

Date of application of EDD 2019/005/R: 20 December 2019.

4. EASA ED Decision 2019/007/R on the simplification of ramp requirements

affects the following documents:

- GM to Annex I (Definitions), issue 1 amendment 9
- AMC and GM to Annex II (Part-ARO), issue 3 amendment 9

Date of publication in the EASA Official Publication: 27 Feb. 2019.

Date of application of EDD 2019/007/R: 01 September 2019, except for Annex II pt. 4 of EDD 2019/007/R introducing AMC1 ARO.RAMP.100(c), which shall apply from 1 January 2020.

5. EASA ED Decision 2019/008/R related to Reg. (EU) 2018/1975 amending Reg. (EU) No 965/2012 on air operations, containing the transposition of provisions on electronic flight bags (EFB) from ICAO Annex 6 and deleting the sailplane requirements from the AMC and GM associated to Reg. (EU) No 965/2012

affects the following documents:

- GM to Annex I (Definitions), issue 1 amendment 10
- AMC and GM to Annex III (Part-ORO), issue 2 amendment 14
- AMC and GM to Annex IV (Part-CAT), issue 2 amendment 16
- AMC and GM to Annex V (Part-SPA), issue 1 amendment 7
- AMC and GM Annex VI (Part-NCC), initial issue, amendment 11
- AMC and GM to Annex VII (Part-NCO), issue 2 amendment 8
- AMC and GM to Annex VIII (Part-SPO), initial issue, amendment 11

Date of publication in the EASA Official Publication: 27 Feb. 2019.

Date of application of EDD 2019/008/R: 9 July 2019.

6. Typographical errors in the unofficial consolidated document on Easy Access Rules, in the following paragraphs:

- AMC1 ARO.RAMP.125(b) point (g); and
- CAT.IDE.H.350.

SUMMARY OF CHANGES – REVISION 11 (JULY 2018)

1. **Commission Regulation (EU) 2018/1042 of 23 July 2018 amending Regulation (EU) No 965/2012, as regards technical requirements and administrative procedures related to introducing support programmes, psychological assessment of flight crew, as well as systematic and random testing of psychoactive substances to ensure medical fitness of flight and cabin crew members, and as regards equipping newly manufactured turbine-powered aeroplanes with a maximum certified take-off mass of 5 700 kg or less and approved to carry six to nine passengers with a terrain awareness warning system**

affects the Cover Regulation (Articles 4 and 9b) and the following Annexes to Reg. (EU) 965/2012:

- Annex I – Definitions
- Annex II – Part-ARO
- Annex IV – Part-CAT
- Annex VI – Part-NCC
- Annex VII – Part-NCO
- Annex VIII – Part-SPO

Date of publication in the Official Journal: 25 July 2018.

Date of application of Reg. (EU) 2018/1042: 14 August 2020, except for the provisions related to TAWS (CAT.IDE.A.150 and SPO.IDE.A.130), which shall apply from 14 August 2018.

SUMMARY OF CHANGES – REVISION 10 (MARCH 2018)

1. **EASA Decision 2017/023/R containing amendments on flight recorders, underwater locating devices and aircraft tracking systems**

affects the following documents:

- GM to Annex I (Definitions), amendment 7
- AMC and GM to Annex III Part-ORO, issue 2 amendment 12
- AMC and GM to Annex IV Part-CAT, issue 2 amendment 13

This Decision is a result of Reg. (EU) 2015/2338, which introduced new requirements for flight recorders, underwater locating devices and aircraft tracking systems. With this regulation, a new point (f) was added to CAT.IDE.A.285 (Flight over water), requiring that large aeroplane operated for commercial air transport over oceanic areas be fitted with a low-frequency underwater locating device.

A first set of AMC and GM complementing the implementing rules published in Reg. (EU) 2015/2338 was issued through Decision 2015/030/R of 17 December 2015.

A second set of AMC and GM covering protection of cockpit voice recorder and flight data recorder parameters was issued through Decision 2016/012/R of 12 September 2016.

This is the third set of AMC and GM to support the implementation of CAT.GEN.MPA.205 and to clarify point (f) of CAT.IDE.A.285.

Date of publication in the EASA Official Publication: 14 December 2017.

Date of application of EDD 2017/023/R: the day following the day of its publication in the EASA Official Publication.

2. **Commission Regulation 2018/394 amending Reg. (EU) No 965/2012 as regards the deletion of air operations requirements for balloons**

affects the Cover Regulation (Articles 1, 2, 3, 5, 6, 8, 10) and the following Annexes to Reg. (EU) 965/2012:

- Annex I – Definitions
- Annex II – Part-ARO
- Annex III – Part-ORO
- Annex IV – Part-CAT
- Annex VII – Part-NCO
- Annex VIII – Part-SPO

Date of publication in the Official Journal: 14 March 2018.

Date of application of Reg. (EU) 2018/394: 8 April 2019.

3. **EASA Decision 2018/003/R related to Reg. (EU) 2018/394 as regards the deletion of the air operations requirements on balloons**

The Decision affects the following documents:

- GM to Cover Regulation – amendment 2
- AMC&GM to Annex II (Part-ARO) – issue 3, amendment 7
- AMC&GM to Annex IV (Part-CAT) – issue 2 amendment 14
- AMC&GM to Annex VII (Part-NCO) – issue 2 amendment 7
- AMC&GM to Annex VIII (Part-SPO) – issue 1 amendment 10

Date of publication in the EASA Official Publication: 23 March 2018.

Date of application of EDD 2018/003/R: 8 April 2019.

SUMMARY OF CHANGES – REVISION 9 (MAY 2017)

EASA Decisions containing the update of the Air Ops rules:

- ED Decision 2017/005/R on GM to Annex I (Definitions), amendment 6
- ED Decision 2017/006/R on AMC/GM to Part-ARO, issue 3 amendment 6
- ED Decision 2017/007/R on AMC/GM to Part-ORO, issue 2 amendment 11
- ED Decision 2017/008/R on AMC/GM to Part-CAT, issue 2 amendment 12
- ED Decision 2017/009/R on AMC/GM to Part-SPA, amendment 6
- ED Decision 2017/010/R on AMC/GM to Part-NCC, amendment 10
- ED Decision 2017/011/R on AMC/GM to Part-NCO, issue 2 amendment 6
- ED Decision 2017/012/R on AMC/GM to Part-SPO, amendment 9

The main changes performed with these Decisions are the following:

- Editorial changes in the AMC/GM to all Annexes;
- Better identification of inspector qualifications (AMC/GM to Part-ARO);
- AMC4 ARO.GEN.200(a)(2) 'Management system. Inspector qualification for CAT operations' becomes applicable 24 months from 30/03/2017;
- More flexibility for operators regarding the location of emergency medical kit (EMK);
- Safety issues identified in passenger (emergency exit) seating and briefing;
- Implementation issues related to helicopter sling load operations (HESLO).

Date of application for all the ED Decisions above: the day following the day of its publication in the EASA Official Publication.

Exception: ED Decision 2017/006/R (Part-ARO):

"AMC4 ARO.GEN.200(a)(2) Management system, INSPECTOR QUALIFICATION FOR CAT OPERATIONS:

- a. shall apply 24 months from the day following that of the publication of this Decision in the EASA Official Publication, and
- b. shall not apply to inspecting staff already qualified as inspector to perform oversight tasks."

Date of publication in the EASA Official Publication of all the ED Decisions above: 30 March 2017.

SUMMARY OF CHANGES – REVISION 8 (MARCH 2017)

1. **Reg. (EU) 2017/363 on single-engined turbine aeroplane operations at night or in instrument meteorological conditions (SET-IMC) and the approval requirements for the dangerous goods training related to commercial SPO, NCC, and non-commercial SPO of complex motor-powered aircraft**

This regulation enters into force on the 20th day following the day of its publication in the Official Journal of the EU.

Date of publication in the Official Journal of the EU: 02 March 2017.

The affected parts are the Cover Regulation (Article 6(3)), Annex II (Part-ARO), Annex III (Part-ORO), Annex IV (Part-CAT) and Annex V (Part-SPA) and related AMC/GM.

The affected paragraphs with the applicability date are marked accordingly in the Revision Table (IR, AMC, GM) further down.

2. **Related EASA Decision 2017/004/R**

The main changes are related to the following topics:

- The single-engined turbine aeroplane operations at night or in instrument meteorological conditions (SET-IMC);
- The one-off flights carrying no passengers or cargo where the aircraft is ferried for refurbishment, repair, maintenance checks, inspections, delivery, export or similar purposes shall be exempted from the application of Regulation (EU) No 965/2012;
- The approval requirements for the dangerous goods training programme for the commercial SPO, NCC and non-commercial SPO with complex-motor powered aircraft.

3. **EASA Decisions 2017/002/R and 2017/003/R (post-transition) in relation to the publication of Regulation (EU) 2017/373 on the management of aeronautical databases and also linked to the OPS amendments to Reg. (EU) 965/2012 already published (Reg. (EU) 2016/1199)**

The changes are related to the publication of Reg. (EU) No 2017/373 on the management of aeronautical databases.

This regulation brings changes only at the level of AMC and GM of the Air operations rules.

The changes affect the following AMC/GM:

- a. EDD 2017/002/R: AMC/GM to Annexes IV (Part-CAT) and VI (Part-NCC).

Date of application: the day following the day of publication in the EASA Official Publication.

Date of publication in the EASA Official Publication: 08 March 2017.

- b. EDD 2017/003/R: AMC/GM to Annexes IV (Part-CAT), VI (Part-NCC), VII (Part-NCO) and VIII (Part-SPO).

Date of application: 1 January 2019.

SUMMARY OF CHANGES – REVISION 7 (OCT. 2016)

1. EASA Decision 2016/022/R on helicopter offshore operations (HOFO) in Reg. (EU) 2016/1199

ED Decision 2016/022/R affected all Annexes to Reg. (EU) No 965/2012.

The changes are related to helicopter offshore operations (HOFO).

This Decision entered into force on the following day after its publication in the EASA Official Publication. It shall apply from 1 July 2018.

Date of publication in the EASA Official Publication: 07 Oct. 2016.

2. Editorial changes, correcting Rev. 6 of Air Ops consolidated version

These changes are not repeated in the Revision Table (IR, AMC, GM).

#	Rule reference	Change
Annex II (Part-ARO)		
1.	AMC1 ARO.RAMP.110	Improper numbering of subparagraphs
2.	Appendix II Operations specifications – the row with PBN	The word “complex” was added in the box
Annex IV (Part-CAT)		
3.	CAT.GEN.MPA.105 (a)(10)	(iii) instead of (ii)
4.	CAT.IDE.A.205 (a)(3)	Update as amended by Reg. 2016/1199

SUMMARY OF CHANGES – REVISION 6 (SEPT. 2016)

1. **Reg. (EU) 2016/1199 on PBN, Helicopter Offshore Operations (HOFO) and data service providers of aeronautical data**

- Operational approval of performance-based navigation;
- Certification and oversight of data services providers and processing of the aeronautical data and information – applicable only from 01 January 2019. The related text is marked and barred;
- Helicopter offshore operations (HOFO) – applicable only from 01 July 2018. The affected text is marked in grey and barred;
- Rules related to the transport of dangerous goods and rules related to upper torso restraint systems on flight crew seats and on passenger seats of certain small aeroplanes;
- Rules related to the carriage and use of supplemental oxygen supply in non-pressurised aeroplanes and helicopters engaged in non-commercial operations;
- Alleviation for twin turboprop aeroplanes with an MCTOM at or below 5 700 kg to operate under the NCO rules.

2. **EASA ED Decision 2016/016/R related to the implementation of PBN requirements of Reg. (EU) 2016/1199**

- ED Decision 2016/016/R on Annex I – Definitions
- ED Decision 2016/014/R on Annex II – Part-ARO
- ED Decision 2016/019/R on Annex III – Part-ORO
- ED Decision 2016/015/R on Annex IV – Part-CAT
- ED Decision 2016/020/R on Annex V – Part-SPA
- ED Decision 2016/017/R on Annex VI – Part-NCC
- ED Decision 2016/018/R on Annex VII – Part-NCO
- ED Decision 2016/021/R on Annex VII – Part-SPO

These Decisions, amending the acceptable means of compliance (AMC) and guidance material (GM) to the annexes to Regulation (EU) No 965/2012 (the ‘Air OPS Regulation’), address an economic issue related to performance-based navigation (PBN) operations. EASA is issuing these Decisions following the amendment of the Air OPS Regulation through Regulation (EU) 2016/1199.

The main changes are:

- The provision of PBN-related rules on pilot training and checking;
- The removal of the requirements for specific approvals for most PBN operations;
- The compliance with the fourth edition of the ICAO PBN Manual; and
- The introduction of proportionate operating procedures where necessary.

The Decisions also include clarifications on the requirements on upper torso restraint (UTR) systems, as well as new AMC and GM on the use of oxygen and on the transport of dangerous goods in the context of NCO operations.

These Decisions entered into force on the following day after their publication in the EASA Official Publication.

Date of publication in the EASA Official Publication: 02/08/2016.

3. EASA ED Decision 2016/012/R related to Reg. (EU) 2015/2338 (second set)

ED Decision 2016/012/R includes changes and new AMC/GM related to Reg. (EU) 2015/2338 on flight recorders, underwater locating devices and aircraft tracking systems.

The new AMC and GM are intended to update the operational requirements applicable to flight data recorders (FDRs). The AMC and GM are related to the following topics:

- Protection and use of recordings of the CVR in normal operation;
- Operational requirements for FDRs when installed on future aircraft; and
- Recording inspection.

This Decision enters into force on the following day after their publication in the EASA Official Publication.

Date of publication in the EASA Official Publication: 13/09/2016.

SUMMARY OF CHANGES – REVISION 5 (MAY 2016)

1. **EDD 2016/008 on PBN (Reg. (EU) 2016/539 amending Reg. (EU) 1178/2011) affecting AMC/GM to Part-ARO and Part-ORO**

This Decision addresses a safety and regulatory coordination issue related to training, testing and checking of pilots who wish to perform performance-based navigation (PBN) operations; it addresses a regulatory coordination issue related to the theoretical knowledge training for aeroplane and helicopter CPL, ATPL, MPL and IR; and it addresses a regulatory coordination issue related to pilot training with an operator after the issue of an MPL. The specific objective is to maintain a high level of safety for holders of the above-mentioned pilot licences.

On 6 April 2016, Commission Regulation (EU) 2016/539 entered into force, which amends Commission Regulation (EU) No 1178/2011 (the Aircrew Regulation) by implementing PBN-related changes to the training, testing and checking of pilots. This Decision proposes the related AMC and GM. It also contains other aircrew-related AMC and GM that were initially related to other Agency rulemaking tasks and, therefore, the following three annexes are annexed to it:

- Annex I: amendments to the AMC/GM to the Aircrew Regulation related to PBN operations (RMT.0256), and AMC/GM to ARA.MED.330 (RMT.0413);
- Annex II: amendments to the AMC/GM to the Aircrew Regulation related to the detailed theoretical knowledge syllabus and learning objectives for ATPL, MPL, CPL and IR for aeroplanes and helicopters (RMT.0188); and
- Annex III: amendments to the AMC/GM to Part-ORO (Issue 2 amd. 7) and Part-ARO (Issue 3 and. 2) of Commission Regulation (EU) No 965/2012 related to the removal of the licence restriction to an operator for MPL holders.

Date of entry into force: on the day following the day of its publication in the Official Publication of the Agency.

Date of publication in the EASA Official Publication: 02 May 2016.

2. **EDD 2016/004 on Special Categories of Passengers (SCP) affecting AMC/GM to Part-ORO and Part-CAT**

This Decision addresses a safety issue related to the safe carriage of special categories of passengers (SCPs). SCPs are persons with reduced mobility (PRMs), infants and unaccompanied children, deportees, inadmissible passengers, or prisoners in custody.

These changes are based on passenger rights and anti-discrimination regulations and will provide operators with more reliable tools to mitigate SCP-related risks and hazards.

This Decision affects the AMC/GM to Part-ORO and Part-CAT. It only applies to European commercial air transport (CAT) operators and is related to Regulation (EU) No 965/2012 on Air Operations.

Application:

- **The AMC/GM to Part-ORO enters into force 48 months following the day of its publication in the Official Publication of the Agency.**
- **The AMC/GM to Part-CAT enters into force 18 months following the day of its publication in the Official Publication of the Agency.**

— **Date of publication in the EASA Official Publication: 27 January 2016**

COVER REGULATION

COMMISSION REGULATION (EU) No 965/2012

of 5 October 2012

laying down technical requirements and administrative procedures related to air operations pursuant to Regulation (EC) No 216/2008 of the European Parliament and of the Council

Regulation (EU) No 965/2012

THE EUROPEAN COMMISSION,

Having regard to the Treaty on the Functioning of the European Union,

Having regard to Regulation (EC) No 216/2008 of the European Parliament and of the Council of 20 February 2008 on common rules in the field of civil aviation and establishing a European Aviation Safety Agency, and repealing Council Directive 91/670/EEC, Regulation (EC) No 1592/2002 and Directive 2004/36/EC¹, and in particular Articles 8(5) and 10(5) thereof,

Whereas:

- (1) Operators and personnel involved in the operation of certain aircraft have to comply with the relevant essential requirements set out in Annex IV to Regulation (EC) No 216/2008.
- (2) Regulation (EC) No 216/2008 requires that Member States, in addition to their oversight of certificates that they have issued, conduct investigations, including ramp inspections, and shall take any measure, including the grounding of aircraft, to prevent the continuation of an infringement.
- (3) In accordance with Regulation (EC) No 216/2008 the Commission should adopt the necessary implementing rules for establishing the conditions for the safe operation of aircraft.
- (4) In order to ensure a smooth transition and a high level of civil aviation safety in the European Union, implementing measures should reflect the state of the art, including best practices, and scientific and technical progress in the field of air operations. Accordingly, technical requirements and administrative procedures agreed under the auspices of the International Civil Aviation Organisation (hereinafter 'ICAO') and the European Joint Aviation Authorities until 30 June 2009, as well as existing legislation pertaining to a specific national environment, should be considered.
- (5) It is necessary to provide sufficient time for the aeronautical industry and Member State administrations to adapt to the new regulatory framework and to recognise under certain conditions the validity of certificates issued before this Regulation applies.
- (6) As this Regulation constitutes an implementing measure referred to in Articles 8(5) and 10(5) of Regulation (EC) No 216/2008, Annex III to Council Regulation (EEC) No 3922/91² and Directive 2004/36/EC of the European Parliament and of the Council³ shall be considered repealed in accordance with Article 69(3) and 69(5) of Regulation (EC) No 216/2008. However, Annex III should remain in place temporarily until the transitional periods foreseen in this Regulation have expired and for those areas for which no implementing measures have yet been adopted.

¹ OJ L 79, 19.3.2008, p. 1.

² OJ L 373, 31.12.1991, p. 4.

³ OJ L 143, 30.4.2004, p. 76.

Similarly, Directive 2004/36/EC should remain applicable temporarily until the transitional periods foreseen in this Regulation have expired.

- (7) The European Aviation Safety Agency prepared draft implementing rules and submitted them as an opinion to the Commission in accordance with Article 19(1) of Regulation (EC) No 216/2008.
- (8) The measures provided for in this Regulation are in accordance with the opinion of the Committee established by Article 65 of Regulation (EC) No 216/2008,

HAS ADOPTED THIS REGULATION:

Article 1 - Subject matter and scope

Regulation (EU) 2018/1975

1. This Regulation lays down detailed rules for air operations with aeroplanes and helicopters, including ramp inspections of aircraft of operators under the safety oversight of another State when landed at aerodromes located in the territory subject to the provisions of the Treaties.
2. This Regulation also lays down detailed rules on the conditions for issuing, maintaining, amending, limiting, suspending or revoking the certificates of operators of aircraft referred to in points (b) (i) and (ii) of Article 2(1) of Regulation (EU) 2018/1139, except for balloons and sailplanes, engaged in commercial air transport operation, the privileges and responsibilities of the holders of certificates as well as conditions under which operations shall be prohibited, limited or subject to certain conditions in the interest of safety.
3. This Regulation also lays down detailed rules on the conditions and procedures for the declaration by operators engaged in commercial specialised operations of aeroplanes and helicopters or in non-commercial operation of complex motor-powered aircraft, including non-commercial specialised operations of complex motor-powered aircraft, of their capability and the availability of the means to discharge the responsibilities associated with the operation of aircraft, and for the oversight of such operators.
4. This Regulation also lays down detailed rules on the conditions under which certain high risk commercial specialised operations shall be subject to authorisation in the interest of safety, and on the conditions for issuing, maintaining, amending, limiting, suspending or revoking the authorisations.
5. This Regulation shall not apply to air operations within the scope of Article 1(2)(a) of Regulation (EC) No 216/2008.
6. This Regulation shall not apply to air operations with airships.
7. This Regulation shall not apply to air operations with balloons and sailplanes. However, in respect of such air operations with balloons, other than tethered gas balloons, and sailplanes, the requirements in respect of oversight of Article 3 shall apply.

Article 2 - Definitions

Regulation (EU) 2019/1384

For the purposes of this Regulation:

- (1) 'aeroplane' means an engine-driven fixed-wing aircraft heavier than air that is supported in flight by the dynamic reaction of the air against its wings;
- (1a) 'helicopter' means a heavier-than-air aircraft supported in flight chiefly by the reactions of the air on one or more power-driven rotors on substantially vertical axes;

- (1b) 'balloon' means a manned lighter-than-air aircraft which is not power-driven and sustains flight through the use of either a lighter-than-air gas or an airborne heater, including gas balloons, hot-air balloons, mixed balloons and, although power-driven, hot-air airships;
- (1c) 'sailplane' means a heavier-than-air aircraft that is supported in flight by the dynamic reaction of the air against its fixed lifting surfaces, the free flight of which does not depend on an engine;
- (1d) 'commercial operation' means any operation of an aircraft, in return for remuneration or other valuable consideration, which is available for the public or, when not made available to the public, which is performed under a contract between an operator and a customer, where the latter has no control over the operator;
- (1e) 'tethered gas balloon' means a gas balloon with a tether system that continuously anchors the balloon to a fixed point during operation;
- (2) 'performance class B aeroplanes' means aeroplanes powered by propeller engines with a maximum operational passenger seating configuration of nine or less and a maximum take-off mass of 5 700 kg or less;
- (3) 'public interest site (PIS)' means a site used exclusively for operations in the public interest;
- (4) 'operation in performance class 1' means an operation that, in the event of failure of the critical engine, the helicopter is able to land within the rejected take-off distance available or safely continue the flight to an appropriate landing area, depending on when the failure occurs;
- (5) 'performance-based navigation (PBN)' means area navigation based on performance requirements for aircraft operating along an ATS route, on an instrument approach procedure or in a designated airspace;
- (6) 'air taxi operation' means, for the purpose of flight time and duty time limitations, a non-scheduled on demand commercial air transport operation with an aeroplane with a maximum operational passenger seating configuration ('MOPSC') of 19 or less;
- (7) 'specialised operation' means any operation, other than commercial air transport operation, where the aircraft is used for specialised activities such as agriculture, construction, photography, surveying, observation and patrol, aerial advertisement, maintenance check flights;
- (8) 'high risk commercial specialised operation' means any commercial specialised aircraft operation carried out over an area where the safety of third parties on the ground is likely to be endangered in the event of an emergency, or, as determined by the competent authority of the place where the operation is conducted, any commercial specialised aircraft operation that, due to its specific nature and the local environment in which it is conducted, poses a high risk, in particular to third parties on the ground;
- (9) 'introductory flight' means any operation against remuneration or other valuable consideration consisting of an air tour of short duration for the purpose of attracting new trainees or new members, performed either by a training organisation referred to in Article 10a of Commission Regulation (EU) No 1178/2011¹ or by an organisation created with the aim of promoting aerial sport or leisure aviation;

¹ Commission Regulation (EU) No 1178/2011 of 3 November 2011 laying down technical requirements and administrative procedures related to civil aviation aircrew pursuant to Regulation (EC) No 216/2008 of the European Parliament and of the Council (OJ L 311, 25.11.2011, p. 1).

- (10) 'competition flight' means any flying activity where the aircraft is used in air races or contests, as well as where the aircraft is used to practice for air races or contests and to fly to and from racing or contest events;
- (11) 'flying display' means any flying activity deliberately performed for the purpose of providing an exhibition or entertainment at an advertised event open to the public, including where the aircraft is used to practice for a flying display and to fly to and from the advertised event.

Additional definitions are laid down in [Annex I](#) for the purposes of Annexes II to VIII.

GM1 Article 2(1)(d) Definitions

ED Decision 2019/019/R

NON-COMMERCIAL OPERATIONS — EXAMPLES

The following examples of operations are not covered by the definition of commercial operations or by that of specialised operations. They are identified as non-commercial operations. Some of these flights are listed by an AOC holder in its operations manual Part-A, ch. 8.7 as non-commercial operations (as specified in [AMC3 ORO.MLR.100](#)) and covered by the provisions of [ORO.AOC.125](#).

Some of these operations are performed on an irregular basis. The operator and its crew members may consider them as non-routine operations, situated outside their operational routine. This constitutes a risk that the operator should include in its risk assessment process.

The operations listed below are performed with aircraft having a certificate of airworthiness or a permit to fly and being already listed on an AOC or on a declaration. They are grouped by the purpose of the flight.

Demonstration flights

- (a) A flight performed with the purpose of demonstrating:
 - (1) an aircraft's handling, performance and functionalities to buyers or lessees;
 - (2) an aircraft's flying characteristics or the operational procedures to the competent authority, for verification of compliance with the operational requirements, as per [ARO.GEN.310\(a\)](#).

Other terms used: (route) proving flight; operational evaluation flight.

- (b) Flight at the end of lease or upon transfer of ownership: a flight performed at the request of the operator to verify compliance of the aircraft with the contractual specifications of the lessee/lessor or buyer.

Other term used: acceptance flight.

- (c) 'Public relations (PR) flight': a flight carrying official or media representatives as non-paying passengers. Sometimes personnel of the operator are included. The PR flight is performed in the interest of the operator's own business.

Testing the results of maintenance work is outside the scope of demonstration flights. Such flights are not expected to execute flight manoeuvres where the aircraft might react with an unexpected behaviour. This is covered by a maintenance check flight (listed below).

Maintenance check flights

(d) Maintenance check flight (MCF)

The definition of an MCF is provided in Annex I to Regulation (EU) No 965/2012. The provisions on MCF are developed in Annex VII (Part-NCO), Subpart E Section 6 and Annex VIII (Part-SPO), Subpart E Section 5.

Ferry flights – flights changing the location of the aircraft

A ferry flight could be performed for the following purposes:

(e) The aircraft is moved to and from a maintenance base. The aircraft may be operated under the permit-to-fly conditions.

Examples:

- (1) unpressurised flight,
- (2) gear-down flight,
- (3) flight with one engine inoperative.

(f) The aircraft is moved from one location to another, e.g. from the manufacturer, refurbishment location, previous owner, lessor/lessee, long-term storage to the operator's base.

Other term used: delivery flight.

(g) The aircraft and its aircrew are positioned to an aerodrome from which a further commercial air transport (CAT) operation will be performed.

Other term used: positioning flight.

(h) The aircraft is moved from its current location to a secure location for various reasons (e.g. to remove it from a hazardous area).

Other term used: recovery flight.

Training flights

(i) A flight for instructional purposes for the operator's own flight crew.

Operator training and checking flight: a flight performed by the operator with the purpose of training, checking and/or familiarising a flight crew member with the operator's procedures linked to the aircraft being operated. A training flight is conducted using the procedures detailed in the operator's documentation.

Line flying under supervision (LIFUS), line checks and similar flights are not included in this category, as they are usually performed during commercial operations (CAT flights).

Other non-commercial flights

(j) 'Corporate flight': a flight conducted for business purposes: the operator may carry its own personnel and/or property in the interest of business.

Other terms used: business flight, private flight.

(k) 'Leisure flight': a flight operated by an operator for personal or recreational purposes, not associated with a business or a profession.

Other term used: private flight.

(l) Managed flight: a flight operated by an operator for the business purposes of the aircraft owner, with no remuneration or other valuable consideration involved.

Charity flights, humanitarian flights

- (m) 'Charity flight': a flight performed for the benefit of a registered charity organisation, carrying persons and/or goods. For such a flight, the proceeds of the raffled flight go to the charity. Any additional proceeds are limited to the recovery of direct costs of the flight.
- (n) 'Humanitarian flight': a flight with the purpose of carrying relief personnel and/or life-saving supplies (basic necessities) during or after an emergency or a natural disaster, or to evacuate persons from an endangered area.

Article 3 - Oversight capabilities

Regulation (EU) 2018/394

1. Member States shall designate one or more entities as the competent authority within that Member State with the necessary powers and allocated responsibilities for the certification and oversight of persons and organisations subject to Regulation (EC) No 216/2008 and its implementing rules.

The administration and management systems of the competent authorities of the Member States and of the Agency shall comply with the requirements specified in Annex II.
2. If a Member State designates more than one entity as competent authority:
 - (a) the areas of competence of each competent authority shall be clearly defined in terms of responsibilities and geographic limitation; and
 - (b) coordination shall be established between those entities to ensure effective oversight of all organisations and persons subject to Regulation (EC) No 216/2008 and its implementing rules within their respective remits.
3. Member States shall ensure that the competent authority(ies) has(ve) the necessary capability to ensure the oversight of all persons and organisations covered by their oversight programme, including sufficient resources to fulfil the requirements of this Regulation.
4. Member States shall ensure that competent authority personnel do not perform oversight activities when there is evidence that this could result directly or indirectly in a conflict of interest, in particular when relating to family or financial interest.
5. Personnel authorised by the competent authority to carry out certification and/or oversight tasks shall be empowered to perform at least the following tasks:
 - (a) examine the records, data, procedures and any other material relevant to the execution of the certification and/or oversight task;
 - (b) take copies of or extracts from such records, data, procedures and other material;
 - (c) ask for an oral explanation on site;
 - (d) enter relevant premises, operating sites or means of transport;
 - (e) perform audits, investigations, assessments, inspections, including ramp inspections and unannounced inspections;
 - (f) take or initiate enforcement measures as appropriate.
6. The tasks under paragraph 5 shall be carried out in compliance with the legal provisions of the relevant Member State.

GM1 Article 3(5)(e) Oversight capabilities

ED Decision 2019/019/R

INSPECTIONS BY PERSONNEL AUTHORISED BY THE COMPETENT AUTHORITY

Inspections performed by personnel authorised by the competent authority to perform oversight or certification tasks means announced or unannounced inspections, including in-flight inspections, to oversee any operations in accordance with this Regulation.

Article 4 - Ramp inspections

Regulation (EU) 2018/1042

1. Ramp inspections of aircraft of operators under the safety oversight of another Member State or of a third country shall be carried out in accordance with Subpart RAMP of Annex II.
2. Member States shall ensure that alcohol testing of flight crew and cabin crew members is carried out with regard to operators under their own oversight as well as with regard to operators under the oversight of another Member State or of a third country. Such testing shall be performed by ramp inspectors within the framework of the ramp inspection programme of Subpart RAMP of Annex II.
3. By way of derogation from paragraph 2, Member States may ensure alcohol testing of flight crew and cabin crew members to be carried out by other authorised officials and outside the framework of the ramp inspection programme of Subpart RAMP of Annex II, provided that such alcohol testing meets the same objectives and adheres to the same principles as tests carried out under the framework of Subpart RAMP of Annex II. Results of such alcohol tests shall be included in the centralised database in accordance with point (b) of [ARO.RAMP.145](#).
4. Member States may carry out additional testing for psychoactive substances other than alcohol. In that case, the Member State shall notify the European Aviation Safety Agency ('the Agency') and the Commission.

GM1 Article 4(3) Ramp inspections

ED Decision 2018/012/R

GENERAL — ALCOHOL TESTING

If alcohol testing of flight crew and cabin crew is carried out by other authorised officials, e.g. by the police, and outside the framework of the ramp inspection programme of Subpart RAMP of Annex II, those other authorised officials do not need to comply with the requirements for qualification of inspectors of Subpart RAMP of Annex II. Member States should ensure that these officials are qualified for carrying out alcohol tests.

Article 5 - Air operations

Regulation (EU) 2021/2237

1. Operators shall only operate an aeroplane or a helicopter for the purpose of commercial air transport (hereinafter "CAT") operations as specified in Annexes III and IV.
 - 1a. Operators engaged in CAT operations starting and ending at the same aerodrome/operating site with Performance class B aeroplanes or non-complex helicopters shall comply with the relevant provisions of Annexes III and IV.

-
2. Operators shall comply with the relevant provisions of Annex V when operating:
 - (a) aeroplanes and helicopters used for:
 - (i) operations using performance-based navigation (PBN);
 - (ii) operations in accordance with minimum navigation performance specifications (MNPS);
 - (iii) operations in airspace with reduced vertical separation minima (RVSM);
 - (iv) low-visibility operations (LVOs) or operations with operational credits;
 - (b) aeroplanes and helicopters used for the transport of dangerous goods (DG);
 - (c) two-engined aeroplanes used for extended range operations (ETOPS) in commercial air transport;
 - (d) helicopters used for commercial air transport operations with the aid of night vision imaging systems (NVIS);
 - (e) helicopters used for commercial air transport hoist operations (HHO);
 - (f) helicopters used for commercial air transport emergency medical service operations (HEMS);
 - (g) helicopters used for offshore operations (HOFO).
 3. Operators of complex motor-powered aeroplanes and helicopters involved in non-commercial operations shall declare their capability and means to discharge their responsibilities associated with the operation of aircraft and operate the aircraft in accordance with the provisions specified in Annex III and Annex VI. Such operators when engaged in non-commercial specialised operations shall operate the aircraft in accordance with the provisions specified in Annex III and VIII instead.
 4. Operators of other-than-complex motor-powered aeroplanes and helicopters involved in non-commercial operations, including non-commercial specialised operations, shall operate the aircraft in accordance with the provisions set out in Annex VII.
 5. Training organisations referred to in Article 10a of Regulation (EU) No 1178/2011 and having their principal place of business in a Member State shall, when conducting flight training into, within or out of the Union, operate:
 - (a) complex motor-powered aeroplanes and helicopters in accordance with the provisions specified in Annex VI;
 - (b) other aeroplanes and helicopters in accordance with the provisions specified in Annex VII.
 6. Operators shall only operate an aeroplane or a helicopter for the purpose of commercial specialised operations in accordance with the requirements specified in Annexes III and VIII.
 7. Flights taking place immediately before, during or immediately after specialised operations and directly connected to those operations shall be operated in accordance with paragraphs 3, 4 and 6, as applicable. Except for crew members, persons other than those indispensable to the mission shall not be carried on board.

Article 6 - Derogations

Regulation (EU) 2019/1384

2. By way of derogation from Article 5(1), aircraft referred to in Article 4(5) of Regulation (EC) No 216/2008 shall, in the case of aeroplanes, be operated under the conditions set out in Commission Decision C(2009) 7633 of 14 October 2009 when used in CAT operations. Any change to the operation that affects the conditions set out in that Decision shall be notified to the Commission and the European Aviation Safety Agency (hereinafter 'the Agency') before the change is implemented.

A Member State, other than an addressee of Decision C(2009)7633, which intends to use the derogation provided for in that Decision shall notify its intention to the Commission and the Agency before the derogation is implemented. The Commission and the Agency shall assess to what extent the change or the intended use deviates from the conditions of Decision C(2009)7633 or impacts on the initial safety assessment performed in the context of that Decision. If the assessment shows that the change or the intended use does not correspond to the initial safety assessment done for Decision C(2009)7633, the Member State concerned shall submit a new derogation request in accordance with Article 14(6) of Regulation (EC) No 216/2008.
3. By way of derogation from Article 5 of this Regulation and without prejudice to point (b) of Article 18(2) of Regulation (EU) 2018/1139 and to Subpart P of Annex I to Commission Regulation (EU) No 748/2012¹ concerning the permit to fly, the following flights shall continue to be operated under the requirements specified in the national law of the Member State in which the operator has its principal place of business, or, where the operator has no principal place of business, the place where the operator is established or resides:
 - (a) flights related to the introduction or modification of aeroplane or helicopter types conducted by design or production organisations within the scope of their privileges;
 - (b) flights carrying no passengers or cargo, where the aeroplane or helicopter is ferried for refurbishment, repair, inspections, delivery, export or similar purposes, provided that the aircraft is not listed on an air operator certificate or on a declaration.
4. Notwithstanding Article 5, Member States may, until 30 June 2018, continue to require a specific approval and additional requirements regarding operational procedures, equipment, crew qualification and training for CAT helicopter offshore operations in accordance with their national law. Member States shall notify the Commission and the Agency of the additional requirements being applied to such specific approvals. Those requirements shall not be less restrictive than those of Annexes III and IV.
- 4a. By way of derogation from Article 5(1) and (6), the following operations with other-than-complex motor-powered aeroplanes and helicopters, may be conducted in accordance with Annex VII:
 - (a) cost-shared flights by private individuals, on the condition that the direct cost is shared by all the occupants of the aircraft, pilot included and the number of persons sharing the direct costs is limited to six;
 - (b) competition flights or flying displays, on the condition that the remuneration or any valuable consideration given for such flights is limited to recovery of direct costs and a

¹ Commission Regulation (EU) No 748/2012 of 3 August 2012 laying down implementing rules for the airworthiness and environmental certification of aircraft and related products, parts and appliances, as well as for the certification of design and production organisations (OJ L 224, 21.8.2012, p. 1).

proportionate contribution to annual costs, as well as prizes of no more than a value specified by the competent authority;

- (c) introductory flights, parachute dropping, sailplane towing or aerobatic flights performed either by a training organisation having its principal place of business in a Member State and referred to in Article 10a of Regulation (EU) No 1178/2011, or by an organisation created with the aim of promoting aerial sport or leisure aviation, on the condition that the aircraft is operated by the organisation on the basis of ownership or dry lease, that the flight does not generate profits distributed outside of the organisation, and that whenever non-members of the organisation are involved, such flights represent only a marginal activity of the organisation.
5. Until 2 September 2017, exemptions granted before 22 March 2017 in accordance with Article 8(2) of Regulation (EEC) No 3922/91, as provided for in Article 6(5) of Regulation (EU) No 965/2012 as applicable before 22 March 2017, shall be considered to constitute approvals referred to in point (a) of [CAT.POL.A.300](#) of Annex IV (Part-CAT). After 2 September 2017, those exemptions shall no longer be valid for the operation of single-engined aeroplanes.
- If any change to the operation of those aeroplanes that affects the conditions set out in those exemptions is envisaged between 22 March 2017 and 2 September 2017, that envisaged change shall be notified to the Commission and the Agency before it is implemented. The Commission and the Agency shall assess the envisaged change in accordance with Article 14(5) of Regulation (EC) No 216/2008.
6. Existing helicopter operations to/from a public interest site (PIS) may be conducted in derogation to [CAT.POL.H.225](#) of Annex IV whenever the size of the PIS, the obstacle environment or the helicopter does not permit compliance with the requirements for operation in performance class 1. Such operations shall be conducted under conditions determined by Member States. Member States shall notify the Commission and the Agency of the conditions being applied.
7. [deleted with Reg. EU 2016/1199]
8. By way of derogation from the first sentence of Article 5(3), operators of complex motor-powered aeroplanes with a maximum certificated take-off mass (MCTOM) at or below 5 700 kg, equipped with turboprop engines, involved in non-commercial operations, shall operate those aircraft only in accordance with Annex VII.
9. By way of derogation from Article 5(5)(a), training organisations shall, when conducting flight training on complex motor-powered aeroplanes with a maximum certificated take-off mass (MCTOM) at or below 5 700 kg, equipped with turboprop engines, operate those aircraft in accordance with Annex VII.

GM1 Article 6.4a Derogations

ED Decision 2018/003/R

OTHER-THAN-COMPLEX MOTOR-POWERED AIRCRAFT

The term 'other-than-complex motor-powered aircraft' is used synonymously with the terms 'other-than complex motor-powered aircraft' and 'other than complex motor-powered aircraft'. Whenever one of these terms is used, it includes also non-motor-powered aircraft such as sailplanes.

GM2 Article 6.4a(a);(b) Derogations

ED Decision 2014/019/R

DIRECT COST

‘Direct cost’ means the cost directly incurred in relation to a flight, e.g. fuel, airfield charges, rental fee for an aircraft. There is no element of profit.

GM3 Article 6.4a(a);(b) Derogations

ED Decision 2014/019/R

ANNUAL COST

‘Annual cost’ means the cost of keeping, maintaining and operating the aircraft over a period of one calendar year. There is no element of profit.

GM1 Article 6.4a(c) Derogations

ED Decision 2014/019/R

ORGANISATION CREATED WITH THE AIM OF PROMOTING AERIAL SPORT OR LEISURE AVIATION

An ‘organisation created with the aim of promoting aerial sport or leisure aviation’ means a non-profit organisation, established under applicable national law for the sole purpose of gathering persons sharing the same interest in general aviation to fly for pleasure or to conduct parachute jumping. The organisation should have aircraft available.

GM2 Article 6.4a(c) Derogations

ED Decision 2014/019/R

MARGINAL ACTIVITY

The term ‘marginal activity’ should be understood as representing a very minor part of the overall activity of an organisation, mainly for the purpose of promoting itself or attracting new students or members. An organisation intending to offer such flights as regular business activity is not considered to meet the condition of marginal activity. Also, flights organised with the sole intent to generate income for the organisation, are not considered to be a marginal activity.

Article 7 - Air operator certificates

Regulation (EU) No 965/2012

1. Air operator certificates (AOCs) issued by a Member State to CAT operators of aeroplanes before this Regulation applies in accordance with Regulation (EEC) No 3922/91 shall be deemed to have been issued in accordance with this Regulation.

However, no later than 28 October 2014:

- (a) operators shall adapt their management system, training programmes, procedures and manuals to be compliant with Annexes III, IV and V, as relevant;
 - (b) the AOC shall be replaced by certificates issued in accordance with Annex II to this Regulation.
2. AOCs issued by a Member State to CAT operators of helicopters before this Regulation applies shall be converted into AOCs compliant with this Regulation in accordance with a conversion report established by the Member State that issued the AOC, in consultation with the Agency.

The conversion report shall describe:

- (a) the national requirements on the basis of which the AOCs were issued;
- (b) the scope of privileges that were given to the operators;
- (c) the differences between the national requirements on the basis of which the AOCs were issued and the requirements of Annexes III, IV and V, together with an indication of how and when the operators will be required to ensure full compliance with those Annexes.

The conversion report shall include copies of all documents necessary to demonstrate the elements set out in points (a) to (c), including copies of the relevant national requirements and procedures.

Article 8 - Flight time limitations

Regulation (EU) 2018/394

1. CAT operations shall be subject to the requirements of Subpart FTL of Annex III.
2. By way of derogation from paragraph 1, air taxi, emergency medical service and single pilot CAT operations by aeroplanes shall be subject to the requirements specified in the national law referred to in Article 8(4) of Regulation (EEC) No 3922/91 and in Subpart Q of Annex III to that Regulation.
3. By way of derogation from paragraph 1, CAT operations with helicopters and CAT operations with sailplanes shall comply with the requirements specified in the national law of the Member State in which the operator has its principal place of business.
4. Non-commercial operations, including non-commercial specialised operations, with complex motor-powered aeroplanes and helicopters, as well as commercial specialised operations with aeroplanes, helicopters and sailplanes shall comply as regards flight time limitations, with the requirements specified in the national law of the Member State in which the operator has its principal place of business, or, where the operator has no principal place of business, the place where the operator is established or resides.

Article 9 - Minimum equipment lists

Regulation (EU) No 71/2014

Minimum equipment lists ('MEL') approved by the State of Operator or Registry before the application of this Regulation, are deemed to be approved in accordance with this Regulation and may continue to be used by the operator.

After the entry into force of this Regulation any change to the MEL referred to in the first subparagraph for which a Master Minimum Equipment List ('MMEL') is established as part of the operational suitability data in accordance with Commission Regulation (EU) No 748/2012¹ shall be made in compliance with point [ORO.MLR.105](#) of Section 2 of Annex III to this Regulation at the earliest opportunity and not later than 18 December 2017 or two years after the operational suitability data was approved, whichever is the latest.

Any change to an MEL referred to in the first subparagraph, for which an MMEL has not been established as part of the operational suitability data, shall continue to be made in accordance with the MMEL accepted by the State of Operator or Registry as applicable.

¹ OJ L 224, 21.8.2012, p. 1.

Article 9a - Flight and cabin crew training

Regulation (EU) No 71/2014

Operators shall ensure that flight crew and cabin crew members who are already in operation and have completed training in accordance with Subparts FC and CC of Annex III which did not include the mandatory elements established in the relevant operational suitability data, undertake training covering those mandatory elements not later than 18 December 2017 or two years after the approval of the operational suitability data, whichever is the latest.

Article 9aa - Flight crew requirements for maintenance check flights

Regulation (EU) 2019/1387

A pilot having acted, before 25 September 2019, as a pilot-in-command on a maintenance check flight that in accordance with the definition in point [SPO.SPEC.MCF.100](#) in Annex VIII is categorised as a Level A maintenance check flight, shall be given credit for the purpose of complying with point [SPO.SPEC.MCF.115\(a\)\(1\)](#) of that Annex. In that case, the operator shall ensure that the pilot-in-command receives a briefing on any differences identified between the operating practices established before 25 September 2019 and the obligations provided in Section 5 of Subpart E of Annex VIII to this Regulation including those derived from the related procedures established by the operator.

Article 9b - Review

Regulation (EU) 2021/1296

1. The Agency shall conduct a continuous review of the effectiveness of the provisions concerning flight and duty time limitations and rest requirements contained in Annexes II and III. No later than 18 February 2019 the Agency shall produce a first report on the results of this review.

That review shall involve scientific expertise and shall be based on operational data gathered, with the assistance of Member States, on a long-term basis after the date of application of this Regulation.

The review shall assess the impact of at least the following on the alertness of aircrew:

- (a) duties of more than 13 hours at the most favourable times of the day;
 - (b) duties of more than 10 hours at less favourable times of the day;
 - (c) duties of more than 11 hours for crew members in an unknown state of acclimatisation;
 - (d) duties including a high level of sectors (more than 6);
 - (e) on-call duties such as standby or reserve followed by flight duties; and
 - (f) disruptive schedules.
2. The Agency shall conduct a continuous review of the effectiveness of the provisions concerning support programmes, the psychological assessment of flight crew and the systematic and random testing of psychoactive substances to ensure the medical fitness of flight crew and cabin crew members set out in Annexes II and IV. No later than 14 August 2023, the Agency shall produce a first report on the results of this review.

That review shall involve relevant expertise and shall be based on data gathered, with the assistance of Member States and the Agency, on a long-term basis.

Article 10 - Entry into force¹

Regulation (EU) 2021/2237

1. This Regulation shall enter into force on the third day following that of its publication in the *Official Journal of the European Union*.

It shall apply from 28 October 2012.

Amending Regulation (EU) No 800/2013 shall apply from 25 August 2013².

Amending Regulation (EU) No 71/2014 shall enter into force on 17 February 2014³. It shall apply not later than 18 December 2017 or two years after the approval of the operational suitability data, whichever is the latest.

Amending Regulation (EU) No 83/2014 shall apply from 18 February 2016, except for the provisions of [ORO.FTL.205\(e\)](#), which shall apply only from 17 February 2017 by way of derogation⁴.

Amending Regulation (EU) No 379/2014 shall apply from 1 July 2014⁵.

Amending Regulation (EU) 2015/140 shall apply from 18 February 2015, except for the provisions of Article 9b 'Review', which shall apply from 18 February 2016⁶.

Amending Regulation (EU) 2015/640 shall apply from 14 May 2015⁷.

Amending Regulation (EU) 2015/1329 shall apply from 1 October 2015, except for the provisions of [ORO.AOC.110\(d\)](#), which shall apply only from 25 August 2017 by way of derogation⁸.

Amending Regulation (EU) 2015/2338 shall apply from 5 January 2016⁹.

Amending Regulation (EU) 2016/1199 shall apply from 25 August 2016¹⁰, except for the provisions related to the helicopter offshore operations, which shall apply from 1 July 2018, and the provisions related to the certification and oversight of data services providers, which shall apply from 1 January 2019.

Amending Regulation (EU) 2017/363 shall apply from 22 March 2017¹¹.

Amending Regulation (EU) 2018/394 shall apply from 8 April 2019¹².

¹ This version of Article 10 is a compilation of the provisions related to the entry into force and application of all previous amendments to Regulation (EU) No 965/2012 to date. For the official version of each amending regulation, please consult the [Official Journal](#).

Regulation (EU) No 965/2012

This Regulation shall be binding in its entirety and directly applicable in all Member States.

Done at Brussels, 5 October 2012.

For the Commission

The President

José Manuel BARROSO

ANNEX I – DEFINITIONS

Annex I Definitions for terms used in Annexes II to VIII

Regulation (EU) 2021/2237

For the purpose of this Regulation, the following definitions shall apply:

- (1) 'accelerate-stop distance available (ASDA)' means the length of the take-off run available plus the length of stopway, if such stopway is declared available by the State of the aerodrome and is capable of bearing the mass of the aeroplane under the prevailing operating conditions;
- (2) 'acceptable means of compliance (AMC)' means non-binding standards adopted by the Agency to illustrate means to establish compliance with Regulation (EC) No 216/2008 and its Implementing Rules;
- (3) 'acceptance checklist' means a document used to assist in carrying out a check on the external appearance of packages of dangerous goods and their associated documents to determine that all appropriate requirements have been met with;
- (4) 'adequate aerodrome' means an aerodrome on which the aircraft can be operated, taking account of the applicable performance requirements and runway characteristics;
- (5) For the purpose of passenger classification:
 - (a) 'adult' means a person of an age of 12 years and above;
 - (b) 'child/children' means persons who are of an age of two years and above but who are less than 12 years of age;
 - (c) 'infant' means a person under the age of two years;
- (6) 'aerodrome operating minima' means the limits of usability of an aerodrome for:
 - (a) take-off, expressed in terms of runway visual range (RVR) and/or visibility and, if necessary, ceiling;
 - (b) landing in 2D instrument approach operations, expressed in terms of visibility and/or RVR, minimum descent altitude/height (MDA/H) and, if necessary, ceiling;
 - (c) landing in 3D instrument approach operations, expressed in terms of visibility and/or RVR and decision altitude/height (DA/H) as appropriate to the type and/or category of the operation;
- (7) 'aided night vision imaging system (NVIS) flight' means, in the case of NVIS operations, that portion of a visual flight rules (VFR) flight performed at night when a crew member is using night vision goggles (NVG);
- (8) 'aircraft' means a machine that can derive support in the atmosphere from the reactions of the air other than the reactions of the air against the earth's surface;
- (8a) 'aircraft tracking' means a ground based process that maintains and updates, at standardised intervals, a record of the four dimensional position of individual aircraft in flight;
- (8b) 'aircraft tracking system' means a system that relies on aircraft tracking in order to identify abnormal flight behaviour and provide alert;
- (8c) 'alternate aerodrome' means an adequate aerodrome to which an aircraft may proceed when it becomes either impossible or inadvisable to proceed to or land at the aerodrome of intended landing, where the necessary services and facilities are available, where aircraft performance

requirements can be met, and which is operational at the expected time of use; ‘alternate aerodrome’ includes the following:

- (a) ‘take-off alternate aerodrome’: an alternate aerodrome at which an aircraft would be able to land if it becomes necessary shortly after take-off and it is not possible to use the aerodrome of departure;
 - (b) ‘en route alternate (ERA) aerodrome’: an alternate aerodrome at which an aircraft would be able to land if a diversion becomes necessary while en route;
 - (c) ‘fuel/energy en route alternate (fuel/energy ERA) aerodrome’ means an ERA aerodrome that is required at the planning stage for use in the calculation of fuel/energy;
 - (d) ‘destination alternate aerodrome’: an alternate aerodrome at which an aircraft would be able to land if it becomes either impossible or inadvisable to land at the aerodrome of intended landing;
- (9) ‘alternative means of compliance’ means those means that propose an alternative to an existing acceptable means of compliance or those that propose new means to establish compliance with Regulation (EC) No 216/2008 and its Implementing Rules for which no associated AMC have been adopted by the Agency;
- (10) ‘anti-icing’, in the case of ground procedures, means a procedure that provides protection against the formation of frost or ice and accumulation of snow on treated surfaces of the aircraft for a limited period of time (hold-over time);
- (11) [deleted with Reg. (EU) 2021/2237]
- (11a) [deleted with Reg. (EU) 2018/1975]
- (12) ‘cabin crew member’ means an appropriately qualified crew member, other than a flight crew or technical crew member, who is assigned by an operator to perform duties related to the safety of passengers and flight during operations;
- (13) [deleted with Reg. (EU) 2021/2237]
- (14) [deleted with Reg. (EU) 2021/2237]
- (15) [deleted with Reg. (EU) 2021/2237]
- (16) [deleted with Reg. (EU) 2021/2237]
- (17) ‘category A with respect to helicopters’ means a multi-engined helicopter designed with engine and system isolation features specified in the applicable certification specification and capable of operations using take-off and landing data scheduled under a critical engine failure concept that assures adequate designated surface area and adequate performance capability for continued safe flight or safe rejected take-off in the event of engine failure;
- (18) ‘category B with respect to helicopters’ means a single-engined or multi-engined helicopter that does not meet category A standards. Category B helicopters have no guaranteed capability to continue safe flight in the event of an engine failure, and unscheduled landing is assumed;
- (18a) ‘ceiling’ means the height above the ground or water of the base of the lowest layer of cloud below 6 000 m (20 000 ft) covering more than half the sky;
- (19) ‘certification specifications’ (CS) means technical standards adopted by the Agency indicating means to show compliance with Regulation (EC) No 216/2008 and its Implementing Rules and which can be used by an organisation for the purpose of certification;
- (20) ‘circling’ means the visual phase of a circling approach operation;

-
- (20a) 'circling approach operation' means a Type A instrument approach operation to bring an aircraft into position for landing on a runway/final approach and take-off area (FATO) that is not suitably located for a straight-in approach;
- (21) 'clearway' means a defined rectangular area on the ground or water under the control of the appropriate authority, selected or prepared as a suitable area over which an aeroplane may make a portion of its initial climb to a specified height;
- (22) 'cloud base' means the height of the base of the lowest observed or forecast cloud element in the vicinity of an aerodrome or operating site or within a specified area of operations, normally measured above aerodrome elevation or, in the case of offshore operations, above mean sea level;
- (22a) 'cockpit voice recorder (CVR)' means a crash-protected flight recorder that uses a combination of microphones and other audio and digital inputs to collect and record the aural environment of the flight crew compartment and communications to, from and between the flight crew members;
- (23) 'code share' means an arrangement under which an operator places its designator code on a flight operated by another operator, and sells and issues tickets for that flight;
- (23a) 'competency' means a dimension of human performance that is used to reliably predict successful performance on the job and which is manifested and observed through behaviours that mobilise the relevant knowledge, skills and attitudes to carry out activities or tasks under specified conditions;
- (23b) 'competency-based training' means assessment and training programmes that are characterised by a performance orientation, emphasis on standards of performance and their measurement and the development of training to the specified performance standards;
- (23c) 'competency framework' means a complete set of identified competencies that are developed, trained and assessed in the operator's evidence-based training programme utilising scenarios that are relevant to operations and which is wide enough to prepare the pilot for both foreseen and unforeseen threats and errors;
- (24) 'congested area' means in relation to a city, town or settlement, any area which is substantially used for residential, commercial or recreational purposes;
- (25) 'contaminated runway' means a runway of which a significant portion of its surface area (whether in isolated areas or not) within the length and width being used is covered by one or more of the substances listed under the runway surface condition descriptors;
- (26) 'contingency fuel/energy' means the fuel/energy required to compensate for unforeseen factors that could have an influence on the fuel/energy consumption to the destination aerodrome;
- (27) 'continuous descent final approach (CDFA)' means a technique, consistent with stabilised approach procedures, for flying the final approach segment (FAS) of an instrument non-precision approach (NPA) procedure as a continuous descent, without level-off, from an altitude/height at or above the final approach fix altitude/height:
- (a) for straight-in approach operations, to a point approximately 15 m (50 ft) above the landing runway threshold or the point where the flare manoeuvre begins; or
 - (b) for circling approach operations, until MDA/H or visual flight manoeuvre altitude/height is reached;

-
- (28) 'converted meteorological visibility (CMV)' means a value, equivalent to an RVR, which is derived from the reported meteorological visibility;
- (29) 'crew member' means a person assigned by an operator to perform duties on board an aircraft;
- (30) 'critical phases of flight' in the case of aeroplanes means the take-off run, the take-off flight path, the final approach, the missed approach, the landing, including the landing roll, and any other phases of flight as determined by the pilot-in-command or commander;
- (31) 'critical phases of flight' in the case of helicopters means taxiing, hovering, take-off, final approach, missed approach, the landing and any other phases of flight as determined by the pilot-in-command or commander;
- (31a) 'current fuel/energy scheme' means the approved fuel/energy scheme that is currently used by the operator;
- (32) [deleted with Reg. (EU) 2019/1387]
- (33) 'dangerous goods (DG)' means articles or substances which are capable of posing a risk to health, safety, property or the environment and which are shown in the list of dangerous goods in the technical instructions or which are classified according to those instructions;
- (34) 'dangerous goods accident' means an occurrence associated with and related to the transport of dangerous goods by air which results in fatal or serious injury to a person or major property damage;
- (35) 'dangerous goods incident' means:
- (a) an occurrence other than a dangerous goods accident associated with and related to the transport of dangerous goods by air, not necessarily occurring on board an aircraft, which results in injury to a person, property damage, fire, breakage, spillage, leakage of fluid or radiation or other evidence that the integrity of the packaging has not been maintained;
 - (b) any occurrence relating to the transport of dangerous goods which seriously jeopardises an aircraft or its occupants;
- (35a) 'decision altitude (DA) or decision height (DH)' means a specified altitude or height in a 3D instrument approach operation at which a missed approach procedure must be initiated if the required visual reference to continue the approach has not been established;
- (36) 'de-icing', in the case of ground procedures, means a procedure by which frost, ice, snow or slush is removed from an aircraft in order to provide uncontaminated surfaces;
- (37) 'defined point after take-off (DPATO)' means the point, within the take-off and initial climb phase, before which the helicopter's ability to continue the flight safely, with the critical engine inoperative, is not assured and a forced landing may be required;
- (38) 'defined point before landing (DPBL)' means the point within the approach and landing phase, after which the helicopter's ability to continue the flight safely, with the critical engine inoperative, is not assured and a forced landing may be required;
- (39) 'distance DR' means the horizontal distance that the helicopter has travelled from the end of the take-off distance available;
- (40) 'dry lease agreement' means an agreement between undertakings pursuant to which the aircraft is operated under the air operator certificate (AOC) of the lessee or, in the case of commercial operations other than CAT, under the responsibility of the lessee;
- (41) 'dry operating mass' means the total mass of the aircraft ready for a specific type of operation, excluding usable fuel and traffic load;
-

-
- (42) 'dry runway' means a runway whose surface is free of visible moisture and not contaminated within the area intended to be used;
- (42a) 'EFB application' means a software application installed on an EFB host platform that provides one or more specific operational functions which support flight operations;
- (42b) 'EFB host platform' means the hardware equipment in which the computing capabilities and basic software reside, including the operating system and the input/output software;
- (42c) 'EFB system' means the hardware equipment (including any battery, connectivity provisions, input/output components) and software (including databases and the operating system) needed to support the intended EFB application(s);
- (42d) 'EBT module' means a combination of sessions in a qualified flight simulation training device as part of the 3-year period of recurrent assessment and training;
- (43) 'ELA1 aircraft' means the following manned European Light Aircraft:
- (a) an aeroplane with a Maximum Take-off Mass (MTOM) of 1 200 kg or less that is not classified as complex motor-powered aircraft;
 - (b) a sailplane or powered sailplane of 1 200 kg MTOM or less;
 - (c) a balloon with a maximum design lifting gas or hot air volume of not more than 3400 m³ for hot air balloons, 1 050 m³ for gas balloons, 300 m³ for tethered gas balloons;
- (44) 'ELA2 aircraft' means the following manned European Light Aircraft:
- (a) an aeroplane with a Maximum Take-off Mass (MTOM) of 2 000 kg or less that is not classified as complex motor-powered aircraft;
 - (b) a sailplane or powered sailplane of 2 000 kg MTOM or less;
 - (c) a balloon;
 - (d) a Very Light Rotorcraft with a MTOM not exceeding 600 kg which is of a simple design, designed to carry not more than two occupants, not powered by turbine and/or rocket engines; restricted to VFR day operations;
- (44a) 'electronic flight bag (EFB)' means an electronic information system, comprised of equipment and applications for flight crew, which allows for the storing, updating, displaying and processing of EFB functions to support flight operations or duties;
- (45) 'elevated final approach and take-off area (elevated FATO)' means a FATO that is at least 3 m above the surrounding surface;
- (45a) 'emergency exit' means an installed exit-type egress point from the aircraft that allows maximum opportunity for cabin and flight crew compartment evacuation within an appropriate time period and includes floor level door, window exit or any other type of exit, for instance hatch in the flight crew compartment and tail cone exit;
- (46) 'enhanced flight vision system (EFVS)' is an electronic means to provide the flight crew with a real-time sensor-derived or enhanced display of the external scene topography (the natural or man-made features of a place or region especially in a way to show their relative positions and elevation) through the use of imaging sensors; an EFVS is integrated with a flight guidance system and is implemented on a head-up display or an equivalent display system; if an EFVS is certified according to the applicable airworthiness requirements and an operator holds the necessary specific approval (when required), then it may be used for EFVS operations and may allow operations with operational credits;

- (46a) 'EFVS operation' means an operation in which visibility conditions require an EFVS to be used instead of natural vision in order to perform an approach or landing, identify the required visual references or conduct a roll-out;
- (46b) 'EFVS 200 operation' means an operation with an operational credit in which visibility conditions require an EFVS to be used down to 200 ft above the FATO or runway threshold. From that point to land, natural vision is used. The RVR shall not be less than 550 m;
- (47) 'enhanced vision system (EVS)' is an electronic means to provide the flight crew with a real-time image of the actual external scene topography (the natural or man-made features of a place or region especially in a way to show their relative positions and elevation) through the use of imaging sensors;
- (47a) 'enrolment' means the administrative action carried out by the operator where a pilot participates in the operator's EBT programme;
- (47b) 'enrolled pilot' means the pilot that participates in the EBT recurrent training programme;
- (47c) 'equivalency of approaches' means all the approaches that place an additional demand on a proficient crew regardless of whether they are used or not in the EBT modules;
- (47d) 'equivalency of malfunctions' means all the malfunctions that put a significant demand on a proficient crew regardless of whether they are used or not in the EBT modules;
- (47e) 'evaluation phase' means one of the phases of an EBT module which is a line-orientated flight scenario, representative of the operator's environment during which there are one or more occurrences to evaluate key elements of the defined competency framework;
- (47f) 'evidence-based training (EBT)' means assessment and training based on operational data that is characterised by developing and assessing the overall capability of a pilot across a range of competencies (competency framework) rather than by measuring the performance in individual events or manoeuvres;
- (48) 'final approach and take-off area (FATO)' means a defined area for helicopter operations, over which the final phase of the approach manoeuvre to hover or land is completed, and from which the take-off manoeuvre is commenced. In the case of helicopters operating in performance class 1, the defined area includes the rejected take-off area available;
- (48a) 'flight crew member' means a licensed crew member charged with duties essential to the operation of an aircraft during a flight duty period;
- (48b) 'final approach segment (FAS)' means that segment of an instrument approach procedure (IAP) in which alignment and descent for landing are accomplished;
- (49) 'flight data monitoring (FDM)' means the proactive and non-punitive use of digital flight data from routine operations to improve aviation safety;
- (49a) 'flight operations officer' or 'flight dispatcher' means a person designated by the operator to engage in the control and supervision of flight operations, who is suitably qualified, who supports, briefs or assists, or both, the pilot-in-command in the safe conduct of the flight;
- (49b) 'flight data recorder (FDR)' means a crash-protected flight recorder that uses a combination of data sources to collect and record parameters that reflect the state and performance of the aircraft;
- (49c) 'flight recorder' means any type of recorder that is installed on the aircraft for the purpose of facilitating accident or incident safety investigations;

- (49d) ‘flight following’ means the recording in real time of departure and arrival messages by operational personnel to ensure that a flight is operating and has arrived at the destination aerodrome or an alternate aerodrome;
- (49e) ‘flight monitoring’ means, in addition to the requirements defined for flight following:
- (a) operational monitoring of flights by suitably qualified operational-control personnel from departure throughout all phases of the flight;
 - (b) communication of all available and relevant safety information between the operational-control personnel on the ground and the flight crew; and
 - (c) critical assistance to the flight crew in the event of an in-flight emergency or security issue, or at the request of the flight crew;
- (50) ‘flight simulation training device (FSTD)’ means a training device which is:
- (a) in the case of aeroplanes, a full flight simulator (FFS), a flight training device (FTD), a flight and navigation procedures trainer (FNPT), or a basic instrument training device (BITD);
 - (b) in the case of helicopters, a full flight simulator (FFS), a flight training device (FTD) or a flight and navigation procedures trainer (FNPT);
- (50a) ‘flight time’ means:
- (a) for aeroplanes, the total time from the moment an aeroplane first moves for the purpose of taking off until the moment the aeroplane finally comes to rest at the end of the flight;
 - (b) for helicopters, the total time between the moment a helicopter’s rotor blades start turning for the purpose of taking off until the moment the helicopter finally comes to rest at the end of the flight, and the rotor blades are stopped;
- (50b) ‘flight watch’ means, in addition to all elements defined for ‘flight monitoring’, the active tracking of a flight by suitably qualified operational-control personnel throughout all phases of the flight to ensure that the flight is following its prescribed route without unplanned deviations, diversions or delays;
- (52) ‘GBAS landing system (GLS)’ means an approach landing system using ground based augmented global navigation satellite system (GNSS/GBAS) information to provide guidance to the aircraft based on its lateral and vertical GNSS position. It uses geometric altitude reference for its final approach slope;
- (52a) ‘go-around’ means a transition from an approach operation to a stabilised climb. This includes manoeuvres conducted at or above the MDA/H or DA/H, or below the DA/H (balked landings);
- (53) ‘ground emergency service personnel’ means any ground emergency service personnel (such as policemen, firemen, etc.) involved with helicopter emergency medical services (HEMSs) and whose tasks are to any extent pertinent to helicopter operations;
- (54) ‘grounding’ means the formal prohibition of an aircraft to take-off and the taking of such steps as are necessary to detain it;
- (55) ‘head-up display landing system (HUDLS)’ means the total airborne system which provides head-up guidance to the pilot to enable the pilot to either control the aircraft or to monitor the autopilot during take-off (if applicable), approach and landing (and roll-out if applicable), or go-around. It includes all the sensors, computers, power supplies, indications and controls;
- (56) [deleted with Reg. (EU) 2021/2237]
- (57) [deleted with Reg. (EU) 2018/1975]

-
- (58) ‘helicopter hoist operation (HHO) crew member’ means a technical crew member who performs assigned duties relating to the operation of a hoist;
- (59) ‘helideck’ means a FATO located on a floating or fixed offshore structure;
- (60) ‘HEMS crew member’ means a technical crew member who is assigned to a HEMS flight for the purpose of attending to any person in need of medical assistance carried in the helicopter and assisting the pilot during the mission;
- (61) ‘HEMS flight’ means a flight by a helicopter operating under a HEMS approval, the purpose of which is to facilitate emergency medical assistance, where immediate and rapid transportation is essential, by carrying:
- (a) medical personnel;
 - (b) medical supplies (equipment, blood, organs, drugs); or
 - (c) ill or injured persons and other persons directly involved;
- (62) ‘HEMS operating base’ means an aerodrome at which the HEMS crew members and the HEMS helicopter may be on stand-by for HEMS operations;
- (63) ‘HEMS operating site’ means a site selected by the commander during a HEMS flight for helicopter hoist operations, landing and take-off;
- (64) ‘HHO flight’ means a flight by a helicopter operating under an HHO approval, the purpose of which is to facilitate the transfer of persons and/or cargo by means of a helicopter hoist;
- (65) ‘HHO offshore’ means a flight by a helicopter operating under an HHO approval, the purpose of which is to facilitate the transfer of persons and/or cargo by means of a helicopter hoist from or to a vessel or structure in a sea area or to the sea itself;
- (66) ‘HHO passenger’ means a person who is to be transferred by means of a helicopter hoist;
- (67) ‘HHO site’ means a specified area at which a helicopter performs a hoist transfer;
- (68) ‘hold-over time (HoT)’ means the estimated time the anti-icing fluid will prevent the formation of ice and frost and the accumulation of snow on the protected (treated) surfaces of an aeroplane;
- (69) ‘hostile environment’ means:
- (a) an area in which:
 - (i) a safe forced landing cannot be accomplished because the surface is inadequate; or
 - (ii) the helicopter occupants cannot be adequately protected from the elements; or
 - (iii) search and rescue response/capability are not provided consistent with anticipated exposure; or
 - (iv) there is an unacceptable risk of endangering persons or property on the ground;
 - (b) in any case, the following areas:
 - (i) for overwater operations, the open sea area north of 45 N and south of 45 S, unless any part is designated as non-hostile by the responsible authority of the State in which the operations take place; and
 - (ii) those parts of a congested area without adequate safe forced landing areas;

- (69a) ‘human–machine interface (HMI)’ means a component of certain devices that is capable of handling human–machine interactions. The interface consists of hardware and software that allow user inputs to be interpreted and processed by machines or systems that, in turn, provide the required results to the user;
- (69b) ‘in-seat instruction’ means a technique used in the manoeuvres training phase or the scenario-based training phase, where the instructors can:
- (a) provide simple instructions to one pilot; or
 - (b) perform predetermined exercises acting, in a pilot seat, as pilot flying (PF) or pilot monitoring (PM) for:
 - (1) the demonstration of techniques; and/or
 - (2) triggering the other pilot to intervene or interact;
- (69c) ‘instructor concordance’ means the consistency or stability of scores between different EBT instructors which gives a score (or scores) of how much homogeneity, or consensus, there is in the ratings given by instructors (raters);
- (69d) ‘instrument approach operation’ means an approach and landing using instruments for navigation guidance based on an instrument approach procedure (IAP). There are two methods for executing instrument approach operations:
- (a) a two-dimensional (2D) instrument approach operation, using lateral navigation guidance only; and
 - (b) a three-dimensional (3D) instrument approach operation, using both lateral and vertical navigation guidance;
- (69e) ‘instrument approach procedure (IAP)’ means a series of predetermined manoeuvres by reference to flight instruments with specified protection from obstacles from the initial approach fix or, where applicable, from the beginning of a defined arrival route to a point from which a landing can be completed and thereafter, if a landing is not completed, to a position at which holding or en-route obstacle clearance criteria apply. IAPs are classified as follows:
- (a) non-precision approach (NPA) procedure, which means an IAP designed for 2D instrument approach operations Type A;
 - (b) approach procedure with vertical guidance (APV) means a performance-based navigation (PBN) IAP designed for 3D instrument approach operations Type A;
 - (c) precision approach (PA) procedure means an IAP based on navigation systems designed for 3D instrument approach operations Type A or B;
- (70) ‘landing decision point (LDP)’ means the point used in determining landing performance from which, an engine failure having been recognised at this point, the landing may be safely continued or a bailed landing initiated;
- (70a) ‘landing distance at time of arrival (LDTA)’ means a landing distance that is achievable in normal operations based on landing performance data and associated procedures determined for the prevailing conditions at the time of landing;
- (71) ‘landing distance available (LDA)’ means the length of the runway which is declared available by the State of the aerodrome and suitable for the ground run of an aeroplane landing;
- (72) ‘landplane’ means a fixed wing aircraft which is designed for taking off and landing on land and includes amphibians operated as landplanes;

-
- (72a) ‘line-orientated flight scenario’ means the assessment and training involving a realistic, ‘real-time’, full mission simulation of scenarios that are representative of line operations;
- (72b) ‘line check’ means a check conducted by the operator and completed by the pilot or the technical crew member to demonstrate competence in carrying out normal line operations described in the operations manual;
- (73) ‘local helicopter operation (LHO)’ means a commercial air transport operation of helicopters with a maximum certified take-off mass (MCTOM) over 3 175 kg and a maximum operational passenger seating configuration (MOPSC) of nine or less, by day, over routes navigated by reference to visual landmarks, conducted within a local and defined geographical area specified in the operations manual;
- (74) ‘low-visibility operations (LVOs)’ means approach or take-off operations on a runway with a runway visual range less than 550 m or with a decision height less than 200 ft;
- (75) ‘low-visibility take-off (LVTO)’ means a take-off with an RVR less than 550 m;
- (76) [deleted with Reg. (EU) 2021/2237]
- (76a) ‘maintenance check flight (‘MCF’)’ means a flight of an aircraft with an airworthiness certificate or with a permit to fly which is carried out for troubleshooting purposes or to check the functioning of one or more systems, parts or appliances after maintenance, if the functioning of the systems, parts or appliances cannot be established during ground checks and which is carried out in any of the following situations:
- (a) as required by the aircraft maintenance manual (‘AMM’) or any other maintenance data issued by a design approval holder being responsible for the continuing airworthiness of the aircraft;
 - (b) after maintenance, as required by the operator or proposed by the organisation responsible for the continuing airworthiness of the aircraft;
 - (c) as requested by the maintenance organisation for verification of a successful defect rectification;
 - (d) to assist with fault isolation or troubleshooting;
- (76b) ‘manoeuvres training phase’ means a phase of an EBT module during which, according to aircraft generation, crews have time to practise and improve performance in largely psychomotor skill-based exercises by achieving a prescribed flight path or performing a prescribed event to a prescribed outcome;
- (76c) ‘mixed EBT programme’ means an operator’s recurrent training and checking programme as per ORO.FC.230, a portion of which is dedicated to the application of EBT but which does not replace proficiency checks as per Appendix 9 to Annex I (Part-FCL) to Regulation (EU) No 1178/2011;
- (77) ‘maximum operational passenger seating configuration (MOPSC)’ means the maximum passenger seating capacity of an individual aircraft, excluding crew seats, established for operational purposes and specified in the operations manual. Taking as a baseline the maximum passenger seating configuration established during the certification process conducted for the type certificate (TC), supplemental type certificate (STC) or change to the TC or STC as relevant to the individual aircraft, the MOPSC may establish an equal or lower number of seats, depending on the operational constraints;
- (78) ‘medical passenger’ means a medical person carried in a helicopter during a HEMS flight, including but not limited to doctors, nurses and paramedics;

- (78a) ‘minor failure condition’ means a failure condition that would not significantly reduce aircraft safety, and which involves flight crew actions that are well within their capabilities;
- (78b) ‘misuse of substances’ means the use of one or more psychoactive substances by flight crew, cabin crew members and other safety-sensitive personnel in a way that:
- (a) constitutes a direct hazard to the user or endangers the lives, health or welfare of others, and/or
 - (b) causes or worsens an occupational, social, mental or physical problem or disorder;
- (78c) ‘minimum descent altitude (MDA) or minimum descent height (MDH)’ means a specified altitude or height in a 2D instrument approach operation or circling approach operation below which descent must not be made without the required visual reference;’
- (79) ‘night’ means the period between the end of evening civil twilight and the beginning of morning civil twilight or such other period between sunset and sunrise as may be prescribed by the appropriate authority, as defined by the Member State;
- (80) ‘night vision goggles (NVG)’ means a head-mounted, binocular, light intensification appliance that enhances the ability to maintain visual surface references at night;
- (81) ‘night vision imaging system (NVIS)’ means the integration of all elements required to successfully and safely use NVGs while operating a helicopter. The system includes as a minimum: NVGs, NVIS lighting, helicopter components, training and continuing airworthiness;
- (82) ‘non-hostile environment’ means an environment in which:
- (a) a safe forced landing can be accomplished;
 - (b) the helicopter occupants can be protected from the elements; and
 - (c) search and rescue response/capability is provided consistent with the anticipated exposure.
- In any case, those parts of a congested area with adequate safe forced landing areas shall be considered non-hostile;
- (83) [deleted with Reg. (EU) 2021/2237]
- (84) ‘NVIS crew member’ means a technical crew member assigned to an NVIS flight;
- (85) ‘NVIS flight’ means a flight under night visual meteorological conditions (VMC) with the flight crew using NVGs in a helicopter operating under an NVIS approval;
- (85a) ‘obstacle clearance altitude (OCA) or obstacle clearance height (OCH)’ means the lowest altitude or the lowest height above the elevation of the relevant runway threshold or the aerodrome elevation, as applicable, used in establishing compliance with the appropriate obstacle clearance criteria;
- (86) ‘offshore operation’ means a helicopter operation that has a substantial proportion of any flight conducted over open sea areas to or from an offshore location;
- (86a) ‘offshore location’ means a facility intended to be used for helicopter operations on a fixed or floating offshore structure or a vessel;
- (86b) ‘open sea area’ means the area of water to seaward of the coastline;
- (87) ‘operating site’ means a site, other than an aerodrome, selected by the operator or pilot-in-command or commander for landing, take-off and/or external load operations;

- (88) 'operation in performance class 1' means an operation that, in the event of failure of the critical engine, the helicopter is able to land within the rejected take-off distance available or safely continue the flight to an appropriate landing area, depending on when the failure occurs;
- (89) 'operation in performance class 2' means an operation that, in the event of failure of the critical engine, performance is available to enable the helicopter to safely continue the flight, except when the failure occurs early during the take-off manoeuvre or late in the landing manoeuvre, in which cases a forced landing may be required;
- (90) 'operation in performance class 3' means an operation that, in the event of an engine failure at any time during the flight, a forced landing may be required in a multi-engined helicopter and will be required in a single-engined helicopter;
- (91) 'operational control' means the responsibility for the initiation, continuation, termination or diversion of a flight in the interest of safety;
- (91a) 'operational credit' means a credit for operations with an advanced aircraft enabling lower aerodrome operating minima than would normally be established by the operator for a basic aircraft, based upon the performance of advanced aircraft systems utilising the available external infrastructure. Lower operating minima may include a lower decision height/altitude or minimum descent height/altitude, reduced visibility requirements or reduced ground facilities or a combination of these;
- (92) 'operator proficiency check' means a check conducted by the operator and completed by the pilot or the technical crew member to demonstrate competence in carrying out normal, abnormal and emergency procedures;
- (93) 'performance class A aeroplanes' means multi-engined aeroplanes powered by turbo-propeller engines with an MOPSC of more than nine or a maximum take-off mass exceeding 5 700 kg, and all multi-engined turbo-jet powered aeroplanes;
- (94) 'performance class B aeroplanes' means aeroplanes powered by propeller engines with an MOPSC of nine or less and a maximum take-off mass of 5 700 kg or less;
- (95) 'performance class C aeroplanes' means aeroplanes powered by reciprocating engines with an MOPSC of more than nine or a maximum take-off mass exceeding 5 700 kg;
- (95a) 'personnel-carrying device system (PCDS)' means a system including one or more devices that is either attached to a hoist or cargo hook or mounted to the rotorcraft airframe during human external cargo (HEC) or helicopter hoist operations (HHO). The devices have the structural capability and features needed to transport occupants external to the helicopter e.g. a life safety harness with or without a quick release and strop with a connector ring, a rigid basket or a cage;
- (95b) 'simple personnel carrying device system (simple 'PCDS')' means a PCDS that complies with the following conditions:
- (a) meets a harmonised standard under Regulation (EU) 2016/425 of the European Parliament and of the Council¹ or Directive 2006/42/EC of the European Parliament and of the Council²;

¹ Regulation (EU) 2016/425 of the European Parliament and of the Council of 9 March 2016 on personal protective equipment and repealing Council Directive 89/686/EEC (OJ L 81, 31.3.2016, p. 51).

² Directive 2006/42/EC of the European Parliament and of the Council of 17 May 2006 on machinery, and amending Directive 95/16/EC (OJ L 157, 9.6.2006, p. 24).

- (b) is designed to restrain no more than a single person (for instance, hoist or cargo hook operator, task specialist or photographer) inside the cabin, or to restrain no more than two persons outside the cabin;
 - (c) is not a rigid structure such as a cage, a platform or a basket;
- (96) 'pilot-in-command' means the pilot designated as being in command and charged with the safe conduct of the flight. For the purpose of commercial air transport operations, the 'pilot-in-command' shall be termed the 'commander';
- (96a) 'portable EFB' means a portable EFB host platform, used on the flight deck, which is not part of the configuration of the certified aircraft;
- (96b) 'portable electronic device (PED)' means any kind of electronic device, typically but not limited to consumer electronics, brought on board the aircraft by crew members, passengers, or as part of the cargo, that is not included in the configuration of the certified aircraft. It includes all equipment that is able to consume electrical energy. The electrical energy can be provided from internal sources such as batteries (chargeable or non-rechargeable) or the devices may also be connected to specific aircraft power sources;
- (97) 'principal place of business' means the head office or registered office of the organisation within which the principal financial functions and operational control of the activities referred to in this Regulation are exercised;
- (98) 'prioritisation of ramp inspections' means the dedication of an appropriate portion of the total number of ramp inspections conducted by or on behalf of a competent authority on an annual basis as provided in Part-ARO;
- (98a) 'proficient' means having demonstrated the necessary skills, knowledge and attitudes that are required to perform any defined tasks to the prescribed standard;
- (98b) 'psychoactive substances' means alcohol, opioids, cannabinoids, sedatives and hypnotics, cocaine, other psychostimulants, hallucinogens, and volatile solvents, with the exception of caffeine and tobacco;
- (99) 'public interest site (PIS)' means a site used exclusively for operations in the public interest;
- (100) 'ramp inspection' means the inspection of aircraft, of flight and cabin crew qualifications and of flight documentation in order to verify the compliance with the applicable requirements;
- (101) 'rectification interval' means a limitation on the duration of operations with inoperative equipment;
- (102) 'rejected take-off distance available (RTODAH)' means the length of the final approach and take-off area declared available and suitable for helicopters operated in performance class 1 to complete a rejected take-off;
- (103) 'rejected take-off distance required (RTODRH)' means the horizontal distance required from the start of the take-off to the point where the helicopter comes to a full stop following an engine failure and rejection of the take-off at the take-off decision point;
- (103a) 'required navigation performance (RNP) specification' means a navigation specification for PBN operations which includes a requirement for on-board navigation performance monitoring and alerting;

- (103b) 'rules of the air' means the rules established in Commission Implementing Regulation (EU) No 923/2012¹;
- (103c) 'runway condition report (RCR)' means a comprehensive standardised report relating to the conditions of the runway surface and their effect on the aeroplane landing and take-off performance, described by means of runway conditions code;
- (104) 'runway visual range (RVR)' means the range over which the pilot of an aircraft on the centre line of a runway can see the runway surface markings or the lights delineating the runway or identifying its centre line;
- (104a) 'safe landing' means, in the context of the fuel/energy policy or fuel/energy schemes, a landing at an adequate aerodrome or operating site with no less than the final reserve fuel/energy remaining and in compliance with the applicable operational procedures and aerodrome operating minima;
- (105) 'safe forced landing' means an unavoidable landing or ditching with a reasonable expectancy of no injuries to persons in the aircraft or on the surface;
- (105a) 'safety-sensitive personnel' means persons who might endanger aviation safety if they perform their duties and functions improperly, including flight crew and cabin crew members, aircraft maintenance personnel and air traffic controllers;
- (105b) 'scenario-based training phase' means a phase of an EBT module which focuses on the development of competencies, whilst the pilot is trained to mitigate the most critical risks identified for the aircraft generation. It should include the management of specific operator's threats and errors in a real-time line orientated environment;
- (106) 'seaplane' means a fixed wing aircraft which is designed for taking off and landing on water and includes amphibians operated as seaplanes;
- (107) 'separate runways' means runways at the same aerodrome that are separate landing surfaces. These runways may overlay or cross in such a way that if one of the runways is blocked, it will not prevent the planned type of operations on the other runway. Each runway shall have a separate approach procedure based on a separate navigation aid;
- (107a) 'specially prepared winter runway' means a runway with a dry frozen surface of compacted snow or ice which has been treated with sand or grit or has been mechanically treated to improve runway friction;
- (108) 'special VFR flight' means a VFR flight cleared by air traffic control to operate within a control zone in meteorological conditions below VMC;
- (109) 'stabilised approach (SAp)' means an approach that is flown in a controlled and appropriate manner in terms of configuration, energy and control of the flight path from a pre-determined point or altitude/height down to a point 50 ft above the threshold or the point where the flare manoeuvre is initiated if higher;
- (109a) 'sterile flight crew compartment' means any period of time when the flight crew members are not disturbed or distracted, except for matters critical to the safe operation of the aircraft or the safety of the occupants;

¹ Commission Implementing Regulation (EU) No 923/2012 of 26 September 2012 laying down the common rules of the air and operational provisions regarding services and procedures in air navigation and amending Implementing Regulation (EU) No 1035/2011 and Regulations (EC) No 1265/2007, (EC) No 1794/2006, (EC) No 730/2006, (EC) No 1033/2006 and (EU) No 255/2010 (OJ L 281, 13.10.2012, p. 1).

- (110) ‘take-off alternate aerodrome’ means an alternate aerodrome at which an aircraft can land should this become necessary shortly after take-off and if it is not possible to use the aerodrome of departure;
- (111) ‘take-off decision point (TDP)’ means the point used in determining take-off performance from which, an engine failure having been recognised at this point, either a rejected take-off may be made or a take-off safely continued;
- (112) ‘take-off distance available (TODA)’ in the case of aeroplanes means the length of the take-off run available plus the length of the clearway, if provided;
- (113) ‘take-off distance available (TODAH)’ in the case of helicopters means the length of the final approach and take-off area plus, if provided, the length of helicopter clearway declared available and suitable for helicopters to complete the take-off;
- (114) ‘take-off distance required (TODRH)’ in the case of helicopters means the horizontal distance required from the start of the take-off to the point at which take-off safety speed (V_{TOSS}), a selected height and a positive climb gradient are achieved, following failure of the critical engine being recognised at the TDP, the remaining engines operating within approved operating limits;
- (115) ‘take-off flight path’ means the vertical and horizontal path, with the critical engine inoperative, from a specified point in the take-off for aeroplanes to 1 500 ft above the surface and for helicopters to 1 000 ft above the surface;
- (116) ‘take-off mass’ means the mass including everything and everyone carried at the commencement of the take-off for helicopters and take-off run for aeroplanes;
- (117) ‘take-off run available (TORA)’ means the length of runway that is declared available by the State of the aerodrome and suitable for the ground run of an aeroplane taking off;
- (117a) ‘task specialist’ means a person assigned by the operator or a third party, or acting as an undertaking, who performs tasks on the ground directly associated with a specialised task or performs specialised tasks on board or from the aircraft;
- (118) ‘technical crew member’ means a crew member in commercial air transport HEMS, HHO or NVIS operations other than a flight or cabin crew member, assigned by the operator to duties in the aircraft or on the ground for the purpose of assisting the pilot during HEMS, HHO or NVIS operations, which may require the operation of specialised on-board equipment;
- (119) ‘technical instructions (TI)’ means the latest effective edition of the ‘Technical instructions for the safe transport of dangerous goods by air’, including the supplement and any addenda, approved and published by the International Civil Aviation Organisation;
- (120) ‘traffic load’ means the total mass of passengers, baggage, cargo and carry-on specialist equipment and including any ballast;
- (120a) ‘type A EFB application’ means an EFB application whose malfunction or misuse has no safety effect;
- (120b) ‘type B EFB application’ means an EFB application:
- (a) whose malfunction or misuse is classified as minor failure condition or below; and
 - (b) which neither replaces nor duplicates any system or functionality required by airworthiness regulations, airspace requirements, or operational rules;
- (120c) ‘training to proficiency’ means training designed to achieve end-state performance objectives, providing sufficient assurance that the trained individual is capable of consistently carrying out specific tasks safely and effectively;

- (120d) 'Type A instrument approach operation' means an instrument approach operation with an MDH or a DH at or above 250 ft;
- (120e) 'Type B instrument approach operation' means an operation with a DH below 250 ft. Type B instrument approach operations are categorised as:
- (a) Category I (CAT I): a DH not lower than 200 ft and with either a visibility not less than 800 m or an RVR not less than 550 m;
 - (b) Category II (CAT II): a DH lower than 200 ft but not lower than 100 ft, and an RVR not less than 300 m;
 - (c) Category III (CAT III): a DH lower than 100 ft or no DH, and an RVR less than 300 m or no RVR limitation;
- (121) 'unaided NVIS flight' means, in the case of NVIS operations, that portion of a VFR flight performed at night when a crew member is not using NVG;
- (122) 'undertaking' means any natural or legal person, whether profit-making or not, or any official body whether having its own personality or not;
- (123) ' V_1 ' means the maximum speed in the take-off at which the pilot must take the first action to stop the aeroplane within the accelerate-stop distance. V_1 also means the minimum speed in the take-off, following a failure of the critical engine at V_{EF} , at which the pilot can continue the take-off and achieve the required height above the take-off surface within the take-off distance;
- (124) ' V_{EF} ' means the speed at which the critical engine is assumed to fail during take-off;
- (124a) 'visibility (VIS)' means visibility for aeronautical purposes, which is the greater of:
- (a) the greatest distance at which a black object of suitable dimensions, situated near the ground, can be seen and recognised when observed against a bright background; and
 - (b) the greatest distance at which lights in the vicinity of 1 000 candelas can be seen and identified against an unlit background;
- (125) 'visual approach operation' means an approach operation by an IFR flight when either a part or all parts of an IAP is (are) not completed and the approach operation is executed with visual reference to terrain;
- (126) 'weather-permissible aerodrome' means an adequate aerodrome where, for the anticipated time of use, meteorological reports, or forecasts, or any combination thereof, indicate that the meteorological conditions will be at or above the required aerodrome operating minima, and the runway surface condition reports indicate that a safe landing will be possible;
- (127) 'wet lease agreement' means an agreement:
- in the case of CAT operations, between air carriers pursuant to which the aircraft is operated under the AOC of the lessor; or
 - in the case of commercial operations other than CAT, between operators pursuant to which the aircraft is operated under the responsibility of the lessor;
- (128) 'wet runway' means a runway whose surface is covered by any visible dampness or water up to and including 3 mm deep within the area intended to be used.

GM1 Annex I Definitions

ED Decision 2022/012/R

DEFINITIONS FOR TERMS USED IN ACCEPTABLE MEANS OF COMPLIANCE AND GUIDANCE MATERIAL

For the purpose of Acceptable Means of Compliance and Guidance Material to [Regulation \(EU\) No 965/2012](#), the following definitions should apply:

- (a) 'Abnormal flight behaviour' means, in the context of an aircraft tracking system, an event affecting a flight:
 - (1) which is outside of the parameters defined by the operator for normal operation or which indicates an obvious deviation from normal operation; and
 - (2) for which the operator has determined that it poses a risk for the safe continuation of the flight or for third parties.
- (a) 'Accuracy' means, in the context of PBN operations, the degree of conformance between the estimated, measured or desired position and/or the velocity of a platform at a given time, and its true position or velocity. Navigation performance accuracy is usually presented as a statistical measure of system error and is specified as predictable, repeatable and relative.
- (b) 'Aircraft-based augmentation system (ABAS)' means a system that augments and/or integrates the information obtained from the other GNSS elements with information available on board the aircraft. The most common form of ABAS is receiver autonomous integrity monitoring (RAIM).
- (ba) 'Airport moving map display (AMMD)' means a software application that displays an airport map on a display device and uses data from a navigation source to depict the aircraft current position on this map while the aircraft is on the ground.
- (c) 'Area navigation (RNAV)' means a method of navigation which permits aircraft operation on any desired flight path within the coverage of station-referenced navigation aids or within the limits of the capability of self-contained aids, or a combination of these.
- (d) 'Availability' means, in the context of PBN operations, an indication of the ability of the system to provide usable service within the specified coverage area and is defined as the portion of time during which the system is to be used for navigation during which reliable navigation information is presented to the crew, autopilot or other system managing the flight of the aircraft.
- (e) 'Committal point' means the point in the approach at which the pilot flying decides that, in the event of an engine failure being recognised, the safest option is to continue to the elevated final approach and take-off area (elevated FATO).
- (f) 'Continuity of function' means, in the context of PBN operations, the capability of the total system, comprising all elements necessary to maintain aircraft position within the defined airspace, to perform its function without non-scheduled interruptions during the intended operation.
- (fa) 'Controlled portable electronic device (C-PED)' means a PED subject to administrative control by the operator that uses it. This includes, inter alia, tracking the allocation of the devices to specific aircraft or persons and ensuring that no unauthorised changes are made to the hardware, software, or databases. C-PEDs can be assigned to the category of non-intentional transmitters or T-PEDs.

- (fb) 'EFB installed resources' means certified EFB hardware components external to the EFB host platform itself, such as input/output components (installed remote displays, keyboards, pointing devices, switches, etc.) or a docking station.
- (fc) 'EFB mounting device' means an aircraft certified part that secures a portable or installed EFB, or EFB system components.
- (fd) 'EFB system supplier' means the company responsible for developing, or for having developed, the EFB system or part of it.
- (g) 'Emergency locator transmitter' is a generic term describing equipment that broadcasts distinctive signals on designated frequencies for the purpose of search and rescue (SAR). The ELT may be activated by various conditions (e.g. manual activation, automatic detection of a distress situation, automatic detection of a crash impact, automatic detection of aircraft immersion into water, etc.). The ELT signals usually include signals that are intended to be detected by the international COSPAS-SARSAT programme, and homing signals that are intended to guide SAR teams to the ELT.
- (h) 'Exposure time' means the actual period during which the performance of the helicopter with the critical engine inoperative in still air does not guarantee a safe forced landing or the safe continuation of the flight.
- (i) 'Fail-operational flight control system' means a flight control system with which, in the event of a failure below alert height, the approach, flare and landing can be completed automatically. In the event of a failure, the automatic landing system will operate as a fail-passive system.
- (j) 'Fail-operational hybrid landing system' means a system that consists of a primary fail-passive automatic landing system and a secondary independent guidance system enabling the pilot to complete a landing manually after failure of the primary system.
- (k) 'Fail-passive flight control system': a flight control system is fail-passive if, in the event of a failure, there is no significant out-of-trim condition or deviation of flight path or attitude but the landing is not completed automatically. For a fail-passive automatic flight control system the pilot assumes control of the aeroplane after a failure.
- (l) 'Flight control system' in the context of low visibility operations means a system that includes an automatic landing system and/or a hybrid landing system.
- (m) 'HEMS dispatch centre' means a place where, if established, the coordination or control of the helicopter emergency medical service (HEMS) flight takes place. It may be located in a HEMS operating base.
- (n) 'Hybrid head-up display landing system (hybrid HUDLS)' means a system that consists of a primary fail-passive automatic landing system and a secondary independent HUD/HUDLS enabling the pilot to complete a landing manually after failure of the primary system.
- (na) 'Installed EFB' means an EFB host platform installed in an aircraft, capable of hosting type A and/or type B EFB applications. It may also host certified applications. It is an aircraft part, and, is therefore, covered by the aircraft airworthiness approval.
- (o) 'Integrity' means, in the context of PBN operations, the ability of a system to provide timely warnings to users when the system should not be used for navigation.
- (p) 'Landing distance available (LDAH)' means the length of the final approach and take-off area plus any additional area declared available by the State of the aerodrome and suitable for helicopters to complete the landing manoeuvre from a defined height.

- (q) 'Landing distance required (LDRH)', in the case of helicopters, means the horizontal distance required to land and come to a full stop from a point 15 m (50 ft) above the landing surface.
- (r) 'Lateral navigation' means a method of navigation which permits aircraft operation on a horizontal plane using radio navigation signals, other positioning sources, external flight path references, or a combination of these.
- (ra) 'mass' and 'weight': In accordance with ICAO Annex 5 and the International System of Units (SI), both terms are used to indicate the actual and limiting masses of aircraft, the payload and its constituent elements, the fuel load, etc. These are expressed in units of mass (kg), but in most approved flight manuals and other operational documentation, these quantities are published as weights in accordance with the common language. In the ICAO standardised system of units of measurement, a weight is a force rather than a mass. Since the use of the term 'weight' does not cause any problem in the day-to-day handling of aircraft, its continued use in operational applications and publications is acceptable.
- (s) 'Maximum structural landing mass' means the maximum permissible total aeroplane mass upon landing under normal circumstances.
- (t) 'Maximum zero fuel mass' means the maximum permissible mass of an aeroplane with no usable fuel. The mass of the fuel contained in particular tanks should be included in the zero fuel mass when it is explicitly mentioned in the aircraft flight manual.
- (ta) 'Miscellaneous (non-EFB) software applications' means non-EFB applications that support function(s) not directly related to the tasks performed by the flight crew in the aircraft.
- (u) 'Overpack', for the purpose of transporting dangerous goods, means an enclosure used by a single shipper to contain one or more packages and to form one handling unit for convenience of handling and stowage.
- (v) 'Package', for the purpose of transporting dangerous goods, means the complete product of the packing operation consisting of the packaging and its contents prepared for transport.
- (w) 'Packaging', for the purpose of transporting dangerous goods, means receptacles and any other components or materials necessary for the receptacle to perform its containment function.
- (x) 'Personal locator beacon (PLB)' is an emergency beacon other than an ELT that broadcasts distinctive signals on designated frequencies, is standalone, portable and is manually activated by the survivors.
- (xa) 'Ramp inspection tool' means the IT application including a centralised database used by all stakeholders to store and exchange data related to ramp inspections.
- (y) 'Receiver autonomous integrity monitoring (RAIM)' means a technique whereby a GNSS receiver/processor determines the integrity of the GNSS navigation signals using only GNSS signals or GNSS signals augmented with altitude. This determination is achieved by a consistency check among redundant pseudo-range measurements. At least one satellite in addition to those required for navigation has to be in view for the receiver to perform the RAIM function.
- (z) 'Rotation point (RP)' means the point at which a cyclic input is made to initiate a nose-down attitude change during the take-off flight path. It is the last point in the take-off path from which, in the event of an engine failure being recognised, a forced landing on the aerodrome can be achieved.

- (za) 'Runway condition assessment matrix (RCAM)' means a matrix that allows the assessment of the runway condition code (RWYCC), using associated procedures, from a set of observed runway surface condition(s) and pilot report of braking action.
- (zb) 'Runway condition code (RWYCC)' means a number, to be used in the runway condition report (RCR), that describes the effect of the runway surface condition on aeroplane deceleration performance and lateral control.
- (zc) 'Runway surface condition' means a description of the condition of the runway surface used in the RCR which establishes the basis for the determination of the RWYCC for aeroplane performance purposes.
- (zd) 'Runway surface condition descriptors' means one of the following elements on the surface of the runway:
 - (1) 'compacted snow': snow that has been compacted into a solid mass such that aeroplane tyres, at operating pressures and loadings, will run on the surface without significant further compaction or rutting of the surface;
 - (2) 'dry snow': snow from which a snowball cannot readily be made;
 - (3) 'frost': ice crystals formed from airborne moisture on a surface whose temperature is at or below freezing; frost differs from ice in that the frost crystals grow independently and, therefore, have a more granular texture;
 - (4) 'ice': water that has frozen or compacted snow that has transitioned into ice in cold and dry conditions;
 - (5) 'slush': snow that is so water-saturated that water will drain from it when a handful is picked up or will splatter if stepped on forcefully;
 - (6) 'standing water': water of depth greater than 3 mm;
 - (7) 'Wet ice': ice with water on top of it or ice that is melting.
 - (8) 'wet snow': snow that contains enough water to be able to make a well compacted, solid snowball, but water will not squeeze out.
- (aaa) 'Slippery wet runway' means a wet runway where the surface friction characteristics of a significant portion of the runway have been determined to be degraded.
- (ab) 'Touch down and lift-off area (TLOF)' means a load-bearing area on which a helicopter may touch down or lift off.
- (ac) 'Transmitting PED (T-PED)' means a portable electronic device (PED) that has intentional radio frequency (RF) transmission capabilities.
- (ad) 'Vertical navigation' means a method of navigation which permits aircraft operation on a vertical flight profile using altimetry sources, external flight path references, or a combination of these.
- (ae) 'Viewable stowage' means a non-certified device that is attached to the flight crew member (e.g. with a kneeboard) or to an existing aircraft part (e.g. using suction cups), and is intended to hold charts or to hold low-mass portable electronic devices that are viewable by the flight crew members at their assigned duty stations.

GM2 Annex I Definitions

ED Decision 2022/012/R

ABBREVIATIONS AND ACRONYMS

The following abbreviations are used in the Annexes to this Regulation:

2D	two-dimensional
3D	three-dimensional
A	aeroplane
a/c	aircraft
AAC	aeronautical administrative communications
AAIM	aircraft autonomous integrity monitoring
AAL	above aerodrome level
ABAS	aircraft-based augmentation system
AC	advisory circular
AC	alternating current
ACAS	airborne collision avoidance system
ADF	automatic direction finder
ADG	air driven generator
ADS	automatic dependent surveillance
ADS-B	automatic dependent surveillance - broadcast
ADS-C	automatic dependent surveillance - contract
AEA	Association of European Airlines
AEO	all-engines-operative
AFFF	aqueous film forming foams
AFM	aircraft flight manual
AFN	aircraft flight notification
AFN	ATS facilities notification
AGL	above ground level
AHRS	attitude heading reference system
AIREP	air-report
AIS	aeronautical information service
ALAP	aerodrome landing analysis programme
ALARP	as low as reasonably practicable
ALD	actual landing distance
ALSF	approach lighting system with sequenced flashing lights
AMC	Acceptable Means of Compliance
AML	aircraft maintenance licence
AMSL	above mean sea level
ANP	actual navigation performance
AOC	aeronautical operational control
AOC	air operator certificate
APCH	approach
APP	approach
APU	auxiliary power unit
APV	approach procedure with vertical guidance
AR	authorisation required
ARA	airborne radar approach
ARA	Authority Requirements for Aircrew
A-RNP	advanced required navigation performance
ARO	Authority Requirements for Air Operations
ARP	Aerospace Recommended Practices
ASC	Air Safety Committee
ASDA	accelerate-stop distance available
ASE	altimeter system error

ATA	Air Transport Association
ATC	air traffic control
ATIS	automatic terminal information service
ATN	air traffic navigation
ATPL	airline transport pilot licence
ATQP	alternative training and qualification programme
ATS	air traffic services
ATSC	air traffic service communication
AVGAS	aviation gasoline
AVTAG	aviation turbine gasoline (wide-cut fuel)
AWO	all weather operations
BALS	basic approach lighting system
Baro VNAV	barometric VNAV
BCAR	British civil airworthiness requirements
BITD	basic instrument training device
CAP	controller access parameters
CAT	commercial air transport
CAT I / II / III	category I / II / III
CBT	computer-based training
CC	cabin crew
CDFA	continuous descent final approach
CDL	configuration deviation list
CFIT	controlled flight into terrain
CG	centre of gravity
CLB	climb
CM	context management
CMV	converted meteorological visibility
CofA	certificate of airworthiness
COM	communication (EBT competency)
COP	code of practice
CoR	certificate of registration
COSPAS-SARSAT	cosmicheskaya sistyema poiska avariynich sudov - search and rescue satellite-aided tracking
CP	committal point
CPA	closest point of approach
CPDLC	controller pilot data link communication
C-PED	controlled portable electronic device
CPL	commercial pilot licence
CRE	class rating examiner
CRI	class rating instructor
CRM	crew resource management
CRZ	cruise
CS	Certification Specifications
CSP	communication service provider
CVR	cockpit voice recorder
CVS	combined vision system
DA	decision altitude
DA/H	decision altitude/height
DAP	downlinked aircraft parameters
D-ATIS	digital automatic terminal information service
DC	direct current
DCL	departure clearance
DES	descent
D-FIS	data link flight information service
DG	dangerous goods

DH	decision height
DI	daily inspection
DIFF	deck integrated fire fighting system
DLR	data link recorder
DME	distance measuring equipment
D-METAR	data link - meteorological aerodrome report
D-OTIS	data link - operational terminal information service
DPATO	defined point after take-off
DPBL	defined point before landing
DR	decision range
DSTRK	desired track
EBT	evidence-based training
EC	European Community
ECAC	European Civil Aviation Conference
EFB	electronic flight bag
EFIS	electronic flight instrument system
EFVS	enhanced flight vision system
EFVS-A	enhanced flight vision system used for approach
EFVS-L	enhanced flight vision system used for landing
EGNOS	European geostationary navigation overlay service
EGT	exhaust gas temperature
ELT	emergency locator transmitter
ELT(AD)	emergency locator transmitter (automatically deployable)
ELT(AF)	emergency locator transmitter (automatic fixed)
ELT(DT)	emergency locator transmitter (distress tracking)
ELT(AP)	emergency locator transmitter (automatic portable)
ELT(S)	survival emergency locator transmitter
EPE	estimated position of error
EPR	engine pressure ratio
EPU	estimated position of uncertainty
ERA	en-route alternate (aerodrome)
ERP	emergency response plan
ETOPS	extended range operations with two-engined aeroplanes
EU	European Union
EUROCAE	European Organisation for Civil Aviation Equipment
EVAL	evaluation phase
EVS	enhanced vision system
FAA	Federal Aviation Administration
FAF	final approach fix
FALS	full approach lighting system
FANS	future air navigation systems
FAP	final approach point
FAR	Federal Aviation Regulation
FAS	final approach segment
FATO	final approach and take-off
FC	flight crew
FCL	flight crew licensing
FCOM	flight crew operating manual
FDM	flight data monitoring
FDO	flying display operation
FDR	flight data recorder
FFS	full flight simulator
FGS	flight control/guidance system
FI	flight instructor
FLIPCY	flight plan consistency

FLTA	forward-looking terrain avoidance
FMECA	failure mode, effects and criticality analysis
FMS	flight management system
FNPT	flight and navigation procedures trainer
FOD	foreign object damage
FOSA	flight operational safety assessment
FOV	field of view
FPA	flight path management — automation (EBT competency)
FPM	flight path management — manual control (EBT competency)
fpm	feet per minute
FRT	fixed radius transition
FSTD	flight simulation training device
ft	feet
FTD	flight training device
FTE	full time equivalent
FTE	flight technical error
FTL	flight and duty time limitations
g	gram
GAGAN	GPS aided geo augmented navigation
GBAS	ground-based augmentation system
GCAS	ground collision avoidance system
GEN	general
GIDS	ground ice detection system
GLS	GBAS landing system
GM	Guidance Material
GMP	general medical practitioner
GND	ground
GNSS	global navigation satellite system
GPS	global positioning system
GPWS	ground proximity warning system
H	helicopter
HEMS	helicopter emergency medical service
HF	high frequency
Hg	mercury
HHO	helicopter hoist operation
HIALS	high intensity approach lighting system
HIGE	hover in ground effect
HLL	helideck limitations list
HOGE	hover out of ground effect
HoT	hold-over time
hPa	hectopascals
HPL	human performance and limitations
HUD	head-up display
HUDLS	head-up guidance landing system
HUMS	health usage monitor system
IAF	initial approach fix
IALS	intermediate approach lighting system
IAP	instrument approach procedure
ICAO	International Civil Aviation Organization
IDE	instruments, data and equipment
IF	intermediate fix
IFR	instrument flight rules
IFSD	in-flight shutdown
IGE	in ground effect
ILS	instrument landing system

IMC	instrument meteorological conditions
in	inches
INS	inertial navigation system
IP	intermediate point
IR	Implementing Rule
IR	instrument rating
IRS	inertial reference system
ISA	international standard atmosphere
ISI	in-seat instruction
ISO	International Organization for Standardization
IV	intravenous
JAA	Joint Aviation Authorities
JAR	Joint Aviation Requirements
kg	kilograms
km	kilometres
KNO	application of knowledge (EBT competency)
kt	knots
LDA	landing distance available
LDF	landing distance factor
LDG	landing
LDP	landing decision point
LDTA	landing distance at time of arrival
LED	light-emitting diode
LHO	local helicopter operation
LHS	left-hand seat
LIFUS	line flying under supervision
LNAV	lateral navigation
LoA	letter of acceptance
LOC	localiser
LOC-I	loss of control in-flight
LOE	line-oriented evaluation
LOFT	line-oriented flight training
LOQE	line-oriented quality evaluation
LOS	limited obstacle surface
LP	Localiser performance
LPV	localiser performance with vertical guidance
LRCS	long range communication system
LRNS	long range navigation system
LSAA	landing system assessment area
LTW	Leadership and teamwork (EBT competency)
LVO	low visibility operation
LVP	low visibility procedures
LVTO	low visibility take-off
m	metres
MALS	medium intensity approach lighting system
MALSF	medium intensity approach lighting system with sequenced flashing lights
MALSR	medium intensity approach lighting system with runway alignment indicator lights
MAPt	missed approach point
MCTOM	maximum certified take-off mass
MDA	minimum descent altitude
MDH	minimum descent height
MEA	minimum en-route altitude
MED	medical
MEL	minimum equipment list
METAR	meteorological aerodrome report

MGA	minimum grid altitude
MHA	minimum holding altitude
MHz	megahertz
MID	midpoint
MLR	manuals, logs and records
MLS	microwave landing system
MLX	millilux
mm	millimetres
MM	multi-mode
MMEL	master minimum equipment list
MNPS	minimum navigation performance specifications
MOC	minimum obstacle clearance
MOCA	minimum obstacle clearance altitude
MOPSC	maximum operational passenger seating configuration
MORA	minimum off-route altitude
MPSC	maximum passenger seating capacity
MSA	minimum sector altitude
MSAS	multi-functional satellite augmentation system
MT	manoeuvres training phase
MTCA	minimum terrain clearance altitude
N	North
NADP	noise abatement departure procedure
NALS	no approach lighting system
NCC	non-commercial operations with complex motor-powered aircraft
NCO	non-commercial operations with other-than-complex motor-powered aircraft
N _F	free power turbine speed
N _G	engine gas generator speed
NM	nautical miles
NOTAM	notice to airmen
NOTECHS	non-technical skills evaluation
NOTOC	notification to captain
NPA	non-precision approach
NPA	Notice of Proposed Amendment
NSE	navigation system error
NVD	night vision device
NVG	night vision goggles
NVIS	night vision imaging system
OAT	outside air temperature
OB	observable behaviour
OCH	obstacle clearance height
OCL	oceanic clearance
ODALS	omnidirectional approach lighting system
OEI	one-engine-inoperative
OFS	obstacle-free surface
OFZ	obstacle free zone
OGE	out of ground effect
OIP	offset initiation point
OM	operations manual
OML	operational multi-pilot limitation
ONC	operational navigation chart
OPS	operations
ORO	Organisation Requirements for Air Operations
OTS CAT II	other than standard category II
PAPI	precision approach path indicator
PAR	precision approach radar

PBCS	performance-based communication and surveillance
PBE	protective breathing equipment
PBN	performance-based navigation
PC/PT	proficiency check/proficiency training
PCDS	personnel carrying device system
PDA	premature descent alert
PDP	predetermined point
PED	portable electronic device
PFC	porous friction course
PIC	pilot-in-command
PIN	personal identification number
PIS	public interest site
PLB	personal locator beacon
PNR	point of no return
POH	pilot's operating handbook
PRM	person with reduced mobility
PRO	application of procedures (EBT competency)
PSD	problem-solving & decision making (EBT competency)
PVD	paravision display
QAR	quick access recorder
QFE	atmospheric pressure at aerodrome elevation / runway threshold
QNH	atmospheric pressure at nautical height
RA	resolution advisory
RAIM	receiver autonomous integrity monitoring
RAT	ram air turbine
RCAM	runway condition assessment matrix
RCC	rescue coordination centre
RCF	reduced contingency fuel
RCLL	runway centre line lights
RCP	required communication performance
RCR	runway condition report
RF	radius to fix
RF	radio frequency
RFC	route facility chart
RI	ramp inspection
RI	rectification interval
RIE	rectification interval extension
RMA	regional monitoring agency
RNAV	area navigation
RNP	required navigation performance
RNP APCH	RNP approach
RNP AR APCH	RNP approach for which authorisation is required
ROD	rate of descent
RP	rotation point
RSP	required surveillance performance
RTCA	Radio Technical Commission for Aeronautics
RTODAH	rejected take-off distance available (helicopters)
RTODRH	rejected take-off distance required (helicopters)
RTOM	reduced take-off mass
RTZL	runway touchdown zone lights
RVR	runway visual range
RVSM	reduced vertical separation minima
RWYCC	runway condition code
S	South
SA CAT I	special authorisation category I

SA CAT II	special authorisation category II
SAFA	safety assessment of foreign aircraft
SALS	simple approach lighting system
SALSF	simple approach lighting system with sequenced flashing lights
SAP	stabilised approach
SAP	system access parameters
SAR	search and rescue
SAS	stability augmentation system
SAW	situation awareness (EBT competency)
SBAS	satellite-based augmentation system
SBT	scenario-based training
SCC	senior cabin crew
SCP	special category of passenger
SDCM	system of differential correction and monitoring
SFE	synthetic flight examiner
SFI	synthetic flight instructor
SID	standard instrument departure
SMM	safety management manual
SMS	safety management system
SNAS	satellite navigation augmentation system
SOP	standard operating procedure
SPA	operations requiring specific approvals
SPECI	aviation selected special weather report
SPO	specialised operations
SRA	surveillance radar approach
SSALF	simplified short approach lighting system with sequenced flashing lights
SSALR	simplified short approach lighting system with runway alignment indicator lights
SSALS	simplified short approach lighting system
SSEC	static source error correction
SSR	secondary surveillance radar
STAR	standard terminal arrival route
STC	supplemental type certificate
SVS	synthetic vision system
TA	traffic advisory
TAC	terminal approach chart
TAS	true airspeed
TAWS	terrain awareness warning system
TC	technical crew
TC	type certificate
TCAS	traffic collision avoidance system
TCCA	Transport Canada Civil Aviation
TCH	type certificate holder
TDP	take-off decision point
TDZ	touchdown zone
TDZE	touchdown zone elevation
THR	threshold
TI	Technical Instructions
TIT	turbine inlet temperature
TLS	target level of safety
TMG	touring motor glider
TO	take-off
TODA	take-off distance available (aeroplanes)
TODAH	take-off distance available (helicopters)
TODRH	take-off distance required (helicopters)
TOGA	take-off/go around

TORA	take-off run available
T-PED	transmitting portable electronic device
TRE	type rating examiner
TRI	type rating instructor
TSE	total system error
TVE	total vertical error
TWIP	terminal weather information for pilots
UMS	usage monitoring system
UPRT	upset prevention and recovery training
UTC	coordinated universal time
V ₂	take-off safety speed
V ₅₀	stalling speed
V _{AT}	indicated airspeed at threshold
VDF	VHF direction finder
VFR	visual flight rules
VHF	very high frequency
VIS	visibility
VMC	visual meteorological conditions
V _{MO}	maximum operating speed
VNAV	vertical navigation
VOR	VHF omnidirectional radio range
VSS	visual segment surface
V _T	threshold speed
VTOL	vertical take-off and landing
V _{TOSS}	take-off safety speed
WAAS	wide area augmentation system
WAC	world aeronautical chart
WIFI	wireless fidelity
WLM	workload management (EBT competency)
ZFTT	zero flight-time training

GM3 Annex I Definitions

ED Decision 2016/022/R

HELIDECK

The term ‘helideck’ includes take-off and landing operations on ships and vessels and covers ‘shipboard final approach and take off areas (FATOs)’.

GM4 Annex I Definitions

ED Decision 2012/015/R

HEAD-UP GUIDANCE LANDING SYSTEM (HUDLS)

A HUDLS is typically used for primary approach guidance to decision heights of 50 ft.

GM5 Annex I Definitions

ED Decision 2016/022/R

HELICOPTER EMERGENCY MEDICAL SERVICES (HEMS) FLIGHT

- (a) A HEMS flight (or more commonly referred to as HEMS mission) normally starts and ends at the HEMS operating base following tasking by the ‘HEMS dispatch centre’. Tasking can also occur when airborne, or on the ground at locations other than the HEMS operating base.

- (b) The following elements should be regarded as integral parts of the HEMS mission:
- (1) flights to and from the HEMS operating site when initiated by the HEMS dispatch centre;
 - (2) flights to and from an aerodrome/operating site for the delivery or pick-up of medical supplies and/or persons required for completion of the HEMS mission; and
 - (3) flights to and from an aerodrome/operating site for refuelling required for completion of the HEMS mission.

GM6 Annex I Definitions

ED Decision 2016/022/R

HOSTILE ENVIRONMENT

Those parts of an open-sea area not considered to constitute a hostile environment should be designated by the appropriate authority in the appropriate aeronautical information publication (AIP) or other suitable documentation.

GM7 Annex I Definitions

ED Decision 2016/022/R

NIGHT VISION IMAGING SYSTEM (NVIS)

Helicopter components of the NVIS include the radio altimeter, visual warning system and audio warning system.

GM8 Annex I Definitions

ED Decision 2016/022/R

OFFSHORE LOCATION

‘Offshore location’ includes, but is not limited to:

- (a) helidecks;
- (b) shipboard heliports; and
- (c) winching areas on vessels or renewable-energy installations.

GM9 Annex I Definitions

ED Decision 2016/022/R

OFFSHORE OPERATIONS

An offshore operation is considered to be a helicopter flight for the purpose of:

- (a) support of offshore oil, gas and mineral exploration, production, storage and transport;
- (b) support to offshore wind turbines and other renewable-energy sources; or
- (c) support to ships including sea pilot transfer.

GM10 Annex I Definitions

ED Decision 2016/022/R

COASTLINE

The national definition of coastline should be included by the appropriate authority in the aeronautical information publication (AIP) or other suitable documentation.

GM11 Annex I Definitions

ED Decision 2016/022/R

PUBLIC INTEREST SITE

An example of a public interest sites is a landing site based at a hospital located in a hostile environment in a congested area, which due to its size or obstacle environment does not allow the application of performance class 1 requirements that would otherwise be required for operations in a congested hostile environment.

GM12 Annex I Definitions

ED Decision 2016/022/R

TECHNICAL INSTRUCTIONS

The ICAO document number for the Technical Instructions is Doc 9284-AN/905.

GM13 Annex I Definitions

ED Decision 2016/022/R

V₁

The first action includes for example: apply brakes, reduce thrust, deploy speed brakes.

GM14 Annex I Definitions

ED Decision 2016/022/R

TASK SPECIALISTS

For the purpose of this Regulation, persons that are carried in a specialised operation, e.g. on a parachute flight, sensational flight or scientific research flight, are considered to be task specialists.

GM15 Annex I Definitions

ED Decision 2019/005/R

UPSET PREVENTION AND RECOVERY TRAINING (UPRT) DEFINITIONS

‘Aeroplane upset prevention and recovery training (UPRT)’ refers to training consisting of:

- aeroplane upset prevention training: a combination of theoretical knowledge and flying training with the aim of providing flight crew with the required competencies to prevent aeroplane upsets; and
- aeroplane upset recovery training: a combination of theoretical knowledge and flying training with the aim of providing flight crew with the required competencies to recover from aeroplane upsets.

‘Aeroplane upset’ refers to an undesired aircraft state characterised by unintentional divergences from parameters normally experienced during operations. An aeroplane upset may involve pitch and/or bank angle divergences as well as inappropriate airspeeds for the conditions.

‘Angle of attack (AOA)’ means the angle between the oncoming air, or relative wind, and a defined reference line on the aeroplane or wing.

‘Approach-to-stall’ means flight conditions bordered by the stall warning and stall.

‘Competency’ means a combination of skills, knowledge, and attitudes required to perform a task to the prescribed standard.

‘Developed upset’ means a condition meeting the definition of an aeroplane upset.

‘Developing upset’ means any time the aeroplane begins to unintentionally diverge from the intended flight path or airspeed.

‘Energy state’ means how much of each kind of energy (kinetic, potential or chemical) the aeroplane has available at any given time.

‘Error’ means an action or inaction by the flight crew that leads to deviations from organisational or flight crew intentions or expectations.

‘Error management’ means the process of detecting and responding to errors with countermeasures that reduce or eliminate the consequences of errors, and mitigate the probability of further errors or undesired aircraft states.

‘First indication of a stall’ means the initial aural, tactile or visual sign of an impending stall, which can be either naturally or synthetically induced.

‘Flight crew resilience’ means the ability of a flight crew member to recognise, absorb and adapt to disruptions.

‘Fidelity level’ means the level of realism assigned to each of the defined FSTD features.

‘Flight path’ means the trajectory or path of the aeroplane travelling through the air over a given space of time.

‘Flight path management’ means active manipulation, using either the aeroplanes automation or manual handling, to command the aeroplane flight controls to direct the aeroplane along a desired trajectory.

‘FSTD Training Envelope’ refers to the high and moderate confidence regions of the FSTD validation envelope.

‘Load factor’ factor means the ratio of a specified load to the weight of the aeroplane, the former being expressed in terms of aerodynamic forces, propulsive forces, or ground reactions.

‘Loss of control in flight (LOCI)’ means a categorisation of an accident or incident resulting from a deviation from the intended flight path.

‘Manoeuvre-based training’ means training that focuses on a single event or manoeuvre in isolation.

‘Negative training’ means training which unintentionally introduces incorrect information or invalid concepts, which could actually decrease rather than increase safety.

‘Negative transfer of training’ means the application (and ‘transfer’) of what was learned in a training environment (i.e., a classroom, an FSTD) to normal practice, i.e. it describes the degree to which what was learned in training is applied to actual normal practices. In this context, negative transfer of training refers to the inappropriate generalisation of knowledge and skill to a situation or setting in normal practice that does not equal the training situation or setting.

‘Post-stall regime’ means flight conditions at an angle of attack greater than the critical angle of attack.

‘Scenario-based training’ means training that incorporates manoeuvres into real-world experiences to cultivate practical flying skills in an operational environment.

‘Stall’ means a loss of lift caused by exceeding the aeroplane’s critical angle of attack.

Note: A stalled condition can exist at any attitude and airspeed, and may be recognised by continuous stall warning activation accompanied by at least one of the following:

- (a) buffeting, which could be heavy at times;
- (b) lack of pitch authority and/or roll control; and
- (c) inability to arrest the descent rate.

‘Stall Event’ means an occurrence whereby the aeroplane experiences conditions associated with an approach-to-stall or a stall.

‘Stall (event) recovery procedure’ means the manufacturer-approved aeroplane-specific stall recovery procedure. If an OEM-approved recovery procedure does not exist, the aeroplane-specific stall recovery procedure developed by the operator, based on the stall recovery template contained in GM5 ORO.FC.220&230, may be used.

‘Stall warning’ means a natural or synthetic indication provided when approaching a stall that may include one or more of the following indications:

- (a) aerodynamic buffeting (some aeroplanes will buffet more than others);
- (b) reduced roll stability and aileron effectiveness;
- (c) visual or aural cues and warnings;
- (d) reduced elevator (pitch) authority;
- (e) inability to maintain altitude or arrest rate of descent; and
- (f) stick shaker activation (if installed).

Note: A stall warning indicates an immediate need to reduce the angle of attack.

‘Startle’ means the initial short-term, involuntary physiological and cognitive reactions to an unexpected event that commence the normal human stress response.

‘Stick pusher’ means a device that, automatically applies a nose down movement and pitch force to an aeroplane’s control columns, to attempt to decrease the aeroplane’s angle of attack. Device activation may occur before or after aerodynamic stall, depending on the aeroplane type.

Note: A stick pusher is not installed on all aeroplane types.

‘Stick shaker’ means a device that automatically vibrates the control column to warn the pilot of an approaching stall.

Note: A stick shaker is not installed on all aeroplane types.

‘Stress (response)’ means the response to a threatening event that includes physiological, psychological and cognitive effects. These effects may range from positive to negative and can either enhance or degrade performance.

‘Surprise’ means the emotionally-based recognition of a difference in what was expected and what is actual.

‘Threat’ means events or errors that occur beyond the influence of the flight crew, increase operational complexity and must be managed to maintain the margin of safety.

‘Threat management’ means the process of detecting and responding to threats with countermeasures that reduce or eliminate the consequences of threats and mitigate the probability of errors or undesired aircraft states.

‘Train-to-proficiency’ means approved training designed to achieve end-state performance objectives, providing sufficient assurances that the trained individual is capable to consistently carry out specific tasks safely and effectively.

Note: In the context of this definition, ‘train-to-proficiency’ can be replaced by ‘training-to-proficiency’.

‘Undesired aircraft state’ means flight crew-induced aircraft position or speed deviation, misapplication of controls, or incorrect systems configuration, associated with a reduction in margins of safety.

Note: Undesired states can be managed effectively, restoring margins of safety, or flight crew response(s) can induce an additional error, incident, or accident.

Note: All countermeasures are necessary flight crew actions. However, some countermeasures to threats, errors and undesired aircraft states that flight crew employ, build upon ‘hard’/systemic-based resources provided by the aviation system.

‘Unsafe situation’ means a situation, which has led to an unacceptable reduction in safety margin.

GM16 Annex I Definitions

ED Decision 2019/008/R

MINOR FAILURE CONDITION

Minor failure conditions may include, for example, a slight reduction in safety margins or functional capabilities, a slight increase in crew workload, such as routine flight plan changes, or some physical discomfort to passengers or cabin crew. Further guidance can be found in AMC 25.1309.

Minor failure conditions are not considered to be unsafe conditions in accordance with AMC 21.A.3B(b).

GM17 Annex I Definitions

ED Decision 2019/019/R

SIMPLE AND COMPLEX PERSONNEL-CARRYING DEVICE SYSTEM (PCDS)

- (a) The following may qualify as a simple PCDS:
 - (1) A safety harness or rescue triangle for no more than two persons.
 - (2) A fixed-rope system for no more than two persons, to be attached under a single cargo hook or Y-rope to be attached to a dual hook.
- (b) The following may not qualify as a simple PCDS:
 - (1) Any system that connects three persons or more to the helicopter.
 - (2) A PCDS with new or novel features.
 - (3) A PCDS that has not yet been proven by an appreciable and satisfactory service experience.
- (c) The connecting elements to the hoist or cargo hook are part of the PCDS.

- (d) The following standards may be used for a simple PCDS:

Table 1: Information on existing available standards applicable to a simple PCDS

Regulation (EU) 2016/425 ¹ or Directive 89/686/EEC if validly marketed before 21 April 2019	Personal protective equipment
Directive 2006/42/EC ²	Machinery
EN 354	Personal protective equipment for work positioning and prevention of falls from a height — lanyards
EN 355	Personal protective equipment against falls from a height — energy absorbers
EN 358	Personal protective equipment for work positioning and prevention of falls from a height — belts for work positioning and restraint and work positioning lanyards
EN 361	Personal protective equipment against falls from a height — full body harnesses
EN 362	Personal protective equipment against falls from a height — connectors
EN 363	Personal fall protection equipment — personal fall-protection systems
EN 364	Personal protective equipment against falls from a height — test methods
EN 365	Marking/packaging/instructions to use
EN 813	Personal fall-protection equipment — sit harnesses
EN 1497	Personal protective equipment against falls from a height — rescue harnesses
EN 1498	Personal protective equipment against falls from a height — rescue loops
EN 1891	Personal protective equipment for the prevention of falls from a height — low stretch kernmantle ropes
EN 12275	Mountaineering equipment — connectors — safety requirements and test methods
EN 12277	Mountaineering equipment — harnesses — safety requirements and test methods

GM18 Annex I Definitions

ED Decision 2019/019/R

DETERMINING THE PRINCIPAL PLACE OF BUSINESS

- (a) The principal place of business encompasses the principal financial functions and operational control of the activities of an operator. It may refer to the organisation's site from which the majority of its management personnel specified in [ORO.GEN.110](#) directs, controls or coordinates its operational activities, ensuring that the organisation complies with Regulation (EU) No 965/2012. For non-commercial operations, this is usually the home base of the aircraft concerned or the location of the flight department.

¹ OJ L 81, 31.3.2016, p. 51.

² OJ L 157, 9.6.2006, p. 24.

- (b) Since an operator, especially in the world of non-commercial operations, may use several places where it performs financial transactions, or several operational bases where there are personnel in charge of operational control, for the purpose of an effective oversight, it is relevant that the principal place of business be the one:
- (1) where the operator has registered its organisation with the local register and where it pays corporate tax;
 - (2) where its main building facilities are located;
 - (3) where main administrative and financial work is being done (where salaries and employment benefits are paid); and
 - (4) from where the organisation management directs, controls or coordinates a substantial part of its activities, ensuring that the organisation complies with the requirements specified in Regulation (EU) No 965/2012.
- (c) Organisations that perform also activities which are not subject to Part-ORO, Part-NCC or Part-SPO are recommended to consider that part of the organisation which is responsible for the operation of aircraft subject to Part-ORO, Part-NCC or Part-SPO.

For such organisations, the accountable manager is that manager who has the authority to ensure that all activities subject to Part-ORO, Part-NCC or Part-SPO can be financed and carried out in accordance with the applicable requirements. If the accountable manager is not located in the part of the organisation that is responsible for the operation of aircraft, but the other criteria mentioned in point (b) apply, the location of the accountable manager does not need to be considered for the determination of the principal place of business.

GM19 Annex I Definitions

ED Decision 2021/002/R

EVIDENCE-BASED TRAINING

‘Behaviour’ refers to the way a person responds, either overtly or covertly, to a specific set of conditions, and which is capable of being measured.

‘Instructor concordance’ is also called ‘inter-rater reliability’.

‘Conditions’ refers to anything that may qualify a specific environment in which performance will be demonstrated.

‘Cycle’ refers to the combination of two modules where Cycle 1 comprises Modules 1 and 2, Cycle 2 comprises Modules 3 and 4, and Cycle 3 comprises Modules 5 and 6 of the 3-year EBT programme.

‘Equivalency of approaches’ refers to approach clustering in other industry documentation.

‘Equivalency of malfunctions’ refers to malfunction clustering in other industry documentation.

‘Evaluation phase (EVAL)’ refers to the phase where a first assessment of competencies is performed in order to identify individual training needs. On completion of the evaluation phase, any areas that do not meet the minimum competency standard will become the focus of the subsequent training. The evaluation phase comprises a complete mission as a crew but not necessarily a complete flight.

‘Facilitation technique’ refers to an active training method, which uses effective questioning, listening and a non-judgemental approach, and is particularly effective in developing skills and attitudes, assisting trainees in developing insight and their own solutions, resulting in better understanding, retention and commitment.

‘Line-orientated flight scenario(s)’ are comprised of scenario elements derived from the table of assessment and training topics.

‘Line-orientated safety audit (LOSA)’ is one of the tools used to help evaluate the performance of the operations. It consists of line flights that are observed by appropriately qualified operator personnel to provide feedback to validate the EBT programme. LOSA may be one of the tools used to look at those elements of the operation that are unable to be monitored by FDM or Advanced FDM programmes.

‘Manoeuvres training phase’ refers to the phase where skill retention is trained (body memory actions). Flight path control may be accomplished by a variety of means including manual aircraft control and the use of auto flight systems.

‘Monitoring’ refers to a cognitive process to compare an actual to an expected state. It requires knowledge, skills and attitudes to create a mental model and to take appropriate action when deviations are recognised.

‘Observable behaviour (OB)’ refers to a single role-related behaviour that can be observed. The instructor may or may not be able to measure it.

‘Performance criteria’ refers to statements used to assess whether the required levels of performance have been achieved for a competency. A performance criterion consists of an OB, a condition (or conditions) and a competency standard.

‘Practical assessment (or EBT practical assessment)’ refers to a method for assessing performance that serves to verify the integrated performance of competencies. It takes place in either a simulated or an operational environment. An EBT assessment is equivalent to a proficiency check and is performed under the instructor privilege in the context of proficiency check in accordance with Appendix 10 to Part-FCL. More information can be found in ICAO Doc 9868 ‘PANS-TRG’.

‘Scenario-based training phase (SBT)’ refers to the largest phase in the EBT programme. It is designed to maximise crew’s exposure to a variety of situations that develop and sustain a high level of competency and resilience. The scenario for this phase should include critical external and environmental threats, to build effective crew interaction to identify and manage errors. A portion of the phase will also be directed towards the management of critical system malfunctions.

Scenario elements address the training topic and detail the threat and/or error that the crew are exposed to.

‘Train-to-proficiency’ refers to approved training designed to achieve end-state performance objectives, providing sufficient assurance that the trained individual is capable of consistently carrying out specific tasks safely and effectively.

Note: In the context of this definition, ‘train-to-proficiency’ can be replaced by ‘training-to-proficiency’.

GM20 Annex I Definitions

ED Decision 2021/005/R

CONTAMINATED RUNWAY

As the runway condition is reported in runway thirds, a significant portion of the runway surface area is more than 25 % of one third of the runway surface area within the required length and width being used.

The runway length being used in this context is the physical length of runway available, typically from the start of the take-off run available (TORA) in one direction to the start of the TORA in the opposite direction. When the runway is shortened by a notice to airmen (NOTAM) — for example, due to works,

or the aerodrome operator is not able to clear the full length of the runway and closes part of it for operations, the length being used is that declared in the NOTAM and the ‘reduced runway length’ that declared in the RCR.

The runway width being used in this context is the physical width of the runway (between the runway edge lights), or the ‘cleared width’ if reported in the RCR. It is not intended that 25 % coverage is reported when contaminants affect only the runway edges after runway cleaning. Runway inspectors are instructed to focus on the area around the wheel tracks when reporting the contaminant type, coverage and depth.

GM21 Annex I Definitions

ED Decision 2021/005/R

DRY RUNWAY/WET RUNWAY

The ‘area intended to be used’ means the area of the runway that is part of the TORA, accelerate and stop distance available (ASDA) or landing distance available (LDA) declared in the aeronautical information publication (AIP) or by a NOTAM.

GM22 Annex I Definitions

ED Decision 2021/005/R

RUNWAY CONDITION CODE (RWYCC)

The purpose of the runway condition code (RWYCC) is to permit an operational aeroplane landing performance calculation by the flight crew.

GM23 Annex I Definitions

ED Decision 2021/005/R

RUNWAY SURFACE CONDITION(S)

- (a) The runway surface conditions used in the RCR establish a common language between the aerodrome operator, the aeroplane manufacturer and the aeroplane operator.
- (b) Aircraft de-icing chemicals and other contaminants are also reported but are not included in the list of runway surface condition descriptors because their effect on the runway surface friction characteristics and the RWYCC cannot be evaluated in a standardised manner.

GM24 Annex I Definitions

ED Decision 2021/005/R

RUNWAY SURFACE CONDITION DESCRIPTORS — GENERAL

The runway surface condition descriptors are used solely in the context of the RCR and are not intended to supersede or replace any existing World Meteorological Organization (WMO) definitions.

RUNWAY SURFACE CONDITION DESCRIPTORS — FROST

- (a) Freezing refers to the freezing point of water (0 °C).
- (b) Under certain conditions, frost can cause the surface to become very slippery, and it is then reported appropriately as downgraded RWYCC.

RUNWAY SURFACE CONDITION DESCRIPTORS — STANDING WATER

Running water of depth greater than 3 mm is reported as ‘standing water’ by convention.

RUNWAY SURFACE CONDITION DESCRIPTORS – WET ICE

Freezing precipitation can lead to runway conditions associated with wet ice from an aeroplane performance point of view. Wet ice can cause the surface to become very slippery. It is then reported appropriately as downgraded RWYCC.

GM25 Annex I Definitions

ED Decision 2021/005/R

LANDING DISTANCE AT TIME OF ARRIVAL

The landing distance data to be used for a landing performance assessment at time of arrival allow to establish an operationally achievable landing distance from 50ft above runway threshold to full stop that takes into account AFM procedures for final approach and landing and is provided as a function of the main influence parameters such as aeroplane mass and configuration, pressure altitude, wind, outside air temperature, runway slope and approach speed increments. It may be provided for use of automation such as autobrakes and autoland and may account for reverse thrust use. As the landing distance at time of arrival is the unfactored minimum landing distance achievable for the assumed conditions, an appropriate margin should be applied to this distance to determine the minimum LDA necessary for a safe stop.

GM26 Annex I Definitions

ED Decision 2021/005/R

SLIPPERY WET RUNWAY

- (a) The surface friction characteristics of the runway are considered degraded when below the minimum standards.
- (b) A portion of runway in the order of 100 m long may be considered significant.

GM27 Annex I Definitions

ED Decision 2021/005/R

FLIGHT RECORDER

A flight recorder may be crash-protected or lightweight and may be deployable or not. Crash-protected flight recorders are capable of withstanding very severe crash conditions such as those encountered during some accidents of large aeroplanes and large helicopters. Crash-protected flight recorders comprise one or more of the following systems: a flight data recorder (FDR), a cockpit voice recorder (CVR), an airborne image recorder (AIR), or a data link recorder (DLR). Lightweight flight recorders are usually designed to meet less demanding requirements than crash-protected flight recorders, which allows them to be lighter. A non-deployable flight recorder is permanently attached to the aircraft. A deployable flight recorder includes a part that is capable of automatically deploying from the aircraft.

GM28 Annex I Definitions for terms used in Annexes II to VIII

ED Decision 2022/005/R

FLIGHT MONITORING AND FLIGHT WATCH — RELEVANT SAFETY INFORMATION

Relevant safety information is any element that may affect the safety of the flight, such as:

- (a) an aircraft technical failure (e.g. failures where flight operations personnel can help to calculate the landing distance or new trip fuel or to update the aerodrome minima);

- (b) unforeseen hazards:
 - (1) air traffic (e.g. delays and/or long distance to complete the approach, extensive use of radar vectoring);
 - (2) meteorological conditions (e.g. DH and aerodrome operating minima, adverse or extreme meteorological conditions);
 - (3) aerodrome and runway status (e.g. insufficient runway length due to brake failure, obstruction or closure of the runway, runway contamination, failure or malfunction caused by on-ground navigation or approach equipment);
 - (4) navigation aid status (e.g. failure of the navigation aids);
 - (5) availability of communications (e.g. failure of communications capabilities, interruptions, interferences, change of frequency channels); and
 - (6) terrain and obstacles (e.g. geophysical phenomena (volcanic eruptions, earthquakes, tsunamis), difficult terrain at an unplanned aerodrome (large bodies of water, mountains);
- (c) updates of the operational flight plan when they affect the fuel reserves:
 - (1) diversion to an en route alternate (ERA) aerodrome, a destination alternate, or a take-off alternate aerodrome;
 - (2) change of the runway selected for landing if the new runway is shorter;
 - (3) location of the decision point or the point of no return (PNR) due to, for instance, change in altitude, in wind data, etc.;
 - (4) significant in-flight change of the flight route compared to the route in the flight planning; or
 - (5) significant deviation from the planned fuel consumption; and
- (d) position reporting:
 - (1) flight-monitoring personnel should report in every phase of the flight: taxi, take-off, climb, cruise, cruise steep climb, descent, approach, landing;
 - (2) flight watch provides active tracking; and
 - (3) where no real-time automatic position-reporting is possible, the operator should have an acceptable alternative to ensure in-flight reporting at least every hour.

GM29 Annex I Definitions for terms used in Annexes II to VIII

ED Decision 2022/005/R

FUEL/ENERGY

The energy used for aircraft propulsion comes from various sources and is of various types.

A frequently used type of energy in aviation is derived from processing (in a piston or turbine engine) hydrocarbon-based fuels that include gasoline (leaded or unleaded), diesel, avgas, JET A-1, and JET B. Hydrogen may also be used as fuel for fuel cell applications, which generate electricity that is used to generate propulsion. However, as current technologies already use other sources of energy for aircraft propulsion, such as stored electrical energy, the typical term 'fuel' has become restrictive and no longer covers emerging technologies.

Therefore, a broader, combined term is introduced to accommodate new types of energy, other than fuel, used for aircraft propulsion purposes.

The term ‘fuel/energy’ should cater for both typical fuel and any other type or source of energy used for aircraft propulsion, including but not limited to electrical energy stored in batteries.

When used in the combination ‘fuel/energy’, the term ‘energy’ only refers to the electrical energy used for aircraft propulsion purposes. It does not include any other form of stored electrical energy that is used on board an aircraft (e.g. batteries of EFBs, ELTs, underwater locating devices (ULDs), automatic external defibrillators (AEDs), or backup energy sources).

GM30 Annex I Definitions for terms used in Annexes II to VIII

ED Decision 2022/005/R

FUEL/ENERGY EN ROUTE ALTERNATE (ERA) AERODROME

Fuel/energy ERA aerodromes could be used in the following cases:

- (a) ‘fuel ERA aerodrome critical scenario’: that aerodrome is used when additional fuel is required at the most critical point along the route to comply with point (c)(6) of point [CAT.OP.MPA.181](#) ‘Fuel/energy scheme — fuel/energy planning and in-flight re-planning policy — aeroplanes’;
- (b) ‘fuel ERA aerodrome 3 %’: that aerodrome is used when an operator reduces the contingency fuel to 3 %; and
- (c) ‘fuel ERA aerodrome PNR’: that aerodrome is used at the PNR during isolated aerodrome operations.

GM31 Annex I Definitions

ED Decision 2022/012/R

DEFINITIONS OF TERMS RELATED TO ALL-WEATHER OPERATIONS

The following terms and concepts are used in the provisions related to all-weather operations in the AMC and GM to [Regulation \(EU\) No 965/2012](#):

‘Advanced aircraft’ means an aircraft with equipment in addition to that required for a basic aircraft for a given take-off, approach or landing operation.

‘AFM or additional data from the TC/STC holder’ — an AFM or additional data from the TC/STC holder may provide:

- limitations, in accordance with which the aircraft must be operated, as described under point 4.1 of Annex V to [Regulation \(EU\) 2018/1139](#). This means that the aircraft may NOT exceed those given values; or
- demonstrated capabilities, which are the assumptions, envelope or conditions that were used to demonstrate adequate performance to comply with the appropriate certification specifications.

However, some AFMs (especially for those aircraft or landing systems that were certified before the introduction of CS-AWO Issue 2) may not include all of the assumptions, envelope or conditions that were used to demonstrate adequate performance. Information regarding the assumptions, envelope, or conditions that were used to demonstrate adequate performance of a landing system can be provided by equivalent documentation issued by TC/STC holder.

Other types of information issued by the TC/STC holder may include (not an exhaustive list):

- equivalence between different aircraft models (types);
- equivalence between aircraft types and variants;

- landing systems equivalence;
- a list of runways with their demonstrated performance;
- a letter of no-technical objection/evaluation letter.

Note: 'TC/STC holder' should be understood as the holder of the certificate for the landing system.

'Basic aircraft' means an aircraft which has the minimum equipment required to perform the intended take-off, approach or landing operation.

'Continuous descent final approach (CDFA)': when the circling altitude/height is reached, it is acceptable to maintain altitude (level-off) and transition to the visual segment. The operator may provide a point in the visual segment in which the descent may be resumed to follow a continuous descent to a point approximately 15 m (50 ft) above the landing runway threshold or the point where the flare manoeuvre begins for the type of aircraft flown.

'Enhanced flight vision system (EFVS)-Approach (EFVS-A)' means a system that has been demonstrated to meet the criteria to be used for approach operations from a decision altitude/height (DA/H) or a minimum descent altitude/height (MDA/H) to 100 ft (30 m) threshold elevation while all system components are functioning as intended, but may have failure modes that could result in the loss of EFVS capability. It should be assumed for an EFVS-A that:

- (a) the pilot will conduct a go-around at or above 100 ft threshold elevation, in the event of an EFVS failure; and
- (b) descent below 100 ft above the threshold elevation through to touchdown and roll-out should be conducted using natural vision so that any failure of the EFVS does not prevent the pilot from completing the approach and landing.

'Enhanced flight vision system (EFVS)-Landing (EFVS-L)' means a system that has been demonstrated to meet the criteria to be used for approach and landing operations that rely on sufficient visibility conditions to enable unaided roll-out and to mitigate for loss of EFVS function.

'Head-up display (HUD) or equivalent display system' means a display system which presents flight information to the pilot's forward external field of view (FOV), and which does not significantly restrict the external view.

'Landing system' means an airborne equipment, which:

- (a) provides automatic control of the aircraft during the approach and landing (i.e. automatic landing system); or
- (b) has been demonstrated to meet the criteria to be used for approach and landing operations (e.g. HUD landing system, EFVS-L or any other approved system).

'Landing system assessment area (LSAA)' means the part of the runway that extends from the threshold to a distance of 600 m from the threshold.

Note — Although the landing systems certification criteria use a value greater than 600 m after the threshold to evaluate limit conditions, for the purpose of flight operations assessment a distance of 600 m is the relevant part as landing beyond this point is not expected to occur in day-to-day operations. The LSAA may not necessarily be coincident with the touchdown zone. The touchdown zone is specified in CS-ADR DSN.

'Low-visibility procedures (LVPs)' means procedures applied by an aerodrome for the purpose of ensuring safety during low-visibility operations (LVOs).

Regular runway means a runway whose characteristics fit within the acceptable limits demonstrated by the original equipment manufacturer (OEM) during certification. The classification of a runway as a ‘regular runway’ is different from one set of equipment to another.

‘Required visual reference’ refers to that section of the visual aids or of the approach area which should have been in view for sufficient time for the pilot to have made an assessment of the aircraft position and rate of change of position, in relation to the desired flight path. In the case of a circling approach, the required visual reference is the runway environment.

‘Satellite-based augmentation system (SBAS)’ means a wide coverage augmentation system in which the user receives augmentation information from a satellite-based transmitter. The most common form of SBAS in Europe is the European Geostationary Navigation Overlay Service (EGNOS).

‘Synthetic vision system (SVS)’ means a system that displays data derived synthetic images of the external scene from the perspective of the flight deck.

‘Landing area’ means that part of a movement area intended for the landing or take-off of aircraft.

‘Touchdown zone (TDZ)’ means the portion of a runway, beyond the threshold, where landing aeroplanes are intended to first contact the runway.

‘Type B instrument approach operations categories’: where decision height (DH) and runway visual range (RVR) fall into different categories of operation, the instrument approach operation would be conducted in accordance with requirements of the most demanding category. This does not apply if the RVR and/or DH has been approved as operational credits.

GM32 Annex I Definitions

ED Decision 2022/012/R

EFVSs — DIFFERENCES WITH ENHANCED VISION SYSTEMS (EVSs)

(a) Introduction to EVSs

EVSs use sensing technology to improve a pilot’s ability to detect objects and topographical features ahead of the aircraft. Different types of sensing technology are used on different aircraft installations. Sensing technologies used include forward-looking infrared, millimetre wave radiometry, millimetre wave radar or low-light level intensification; additional technologies may be developed in the future. The image from sensors may be displayed to the pilot in a number of different ways including ‘head-up’ and ‘head-down’ displays.

(b) EVSs and EFVSs

An EFVS is an EVS that is integrated with a flight guidance system, which presents the image from sensors to the pilot on a head-up display (HUD) or equivalent display. If EFVS equipment is certified according to the applicable airworthiness requirements and an operator holds the necessary specific approval, then an EFVS may be used for EFVS operations. An EFVS operation is an operation with an operational credit which allows operating in visibility conditions lower than those in which operations without the use of EFVS are permitted.

(c) Functions of EVSs

Depending on the capabilities of the particular system, EVSs may be useful during operations at night or in reduced visibility for the following:

- (1) improving visibility of airport features and other traffic during ground operations;
- (2) displaying terrain and obstructions in flight;
- (3) displaying weather in flight;

- (4) improving visibility of the runway environment during approach operations; and
- (5) improving visibility of obstructions on a runway (e.g. aircraft, vehicles or animals) during take-off and approach operations.

(d) Limitations of EVSs

EVSs are a useful tool for enhancing situational awareness; however, each EVS installation has its own specific limitations. These may include:

- (1) Performance variations depend on conditions including ambient temperature and lighting and weather phenomena. A system may provide very different image qualities in the same visibility depending on the particular phenomena causing restricted visibility, e.g. haze, rain, fog, snow, dust, etc.
- (2) An EVS may not be able to detect certain types of artificial lighting. Light emitting diode (LED) lights have a much lower infrared signature than incandescent lights and therefore may not be detected by some types of EVSs. LED lighting is used for runway, taxiway and approach lighting at many airports.
- (3) Monochrome display. EVSs will generally not be able to detect and display the colour of airport lighting. This means that colour coding used on airport lighting will not be visible to the pilot using an EVS.
- (4) Many EVS installations do not have redundancy, so a single failure may lead to loss of EVS image.
- (5) The location of the sensor on the airframe may mean that in certain conditions it could be susceptible to ice accretion or obscuration from impact damage from objects such as insects or birds.
- (6) Where an EVS image is presented on a HUD or an equivalent display, the image needs to be consistent with the pilot's external view through the display. Particular installations may have limitations on the conditions under which this consistent image can be generated (e.g. crosswind conditions during approach).
- (7) Imaging sensor performance can be variable and unpredictable. Pilots should not assume that a flightpath is free of hazards because none are visible in an EVS image.

(e) Considerations for the use of EVSs

EVSs may be used in all phases of flight and have significant potential to enhance the pilot's situational awareness. No specific approval is required for the use of an EVS; however, the operator is responsible for ensuring that the flight crew members have received training on the equipment installed on their aircraft in accordance with [ORO.FC.120](#). In addition, the operator is responsible for evaluating the risks associated with system limitations and for implementing suitable mitigation measures in accordance with [ORO.GEN.200\(a\)\(3\)](#) before using the EVS.

The use of EVSs does not permit the use of different operating minima, and EVS images cannot replace natural vision for the required visual reference in any phase of flight including take-off, approach or landing.

An EVS that is not an EFVS cannot be used for EFVS operations and therefore does not obtain an operational credit.

GM33 Annex I Definitions

ED Decision 2022/012/R

INSTRUMENT APPROACH OPERATIONS

- (a) Depending on the instrument approach procedure (IAP) in use, the lateral and vertical navigation guidance for an instrument approach operation may be provided by:
 - (1) a ground-based radio navigation aid; or
 - (2) computer-generated navigation data from ground-based, space-based or self-contained navigation aids or a combination of these.
- (b) A non-precision approach (NPA) procedure flown as CDFA with vertical path guidance calculated by on-board equipment is considered to be a 3D instrument approach operation. Depending on the limitations of the equipment and information sources used to generate vertical guidance, it may be necessary for the pilot to cross-check this guidance against other navigational sources during the approach and to ensure that the minimum altitude/height over published step-down fixes is observed. CDFAs with manual calculation of the required rate of descent are considered 2D operations.
- (c) Further guidance on the classification of an instrument approach operation based on the designed lowest operating minima is contained in Appendix J to ICAO Doc 9365 Manual of All-Weather Operations, Fourth Edition, 2017.

GM34 Annex I Definitions

ED Decision 2022/012/R

DECISION ALTITUDE (DA) OR DECISION HEIGHT (DH)

- (a) Decision altitude (DA) is referenced to mean sea level and decision height (DH) is referenced to the threshold elevation.
- (b) For operations using DA, the aircraft altimeters are set to QNH. For operations using a barometric DH, the aircraft altimeters are set to QFE.
- (c) For SA CAT I, SA CAT II, CAT II/III operations, the DH is based on the use of a radio altimeter or other devices capable of providing equivalent performance. The DH is determined with reference to threshold elevation, but the value of the DH set for the approach will be based on the height of the aircraft above the pre-threshold terrain, which may be higher or lower than the threshold.
- (d) For convenience, when both expressions are used, they may be written in the form 'decision altitude/height' and abbreviated 'DA/H'.

GM35 Annex I Definitions

ED Decision 2022/012/R

MINIMUM DESCENT ALTITUDE (MDA) OR MINIMUM DESCENT HEIGHT (MDH)

- (a) Minimum descent altitude (MDA) is referenced to mean sea level and minimum descent height (MDH) is referenced to the aerodrome elevation or to the threshold elevation if that is more than 7 ft below the aerodrome elevation. An MDH for a circling approach is referenced to the aerodrome elevation.
- (b) For operations using MDA, the aircraft altimeters are set to QNH. For operations using a barometric MDH, the aircraft altimeters are set to QFE.

- (c) For convenience, when both expressions are used, they may be written in the form 'minimum descent altitude/height' and abbreviated 'MDA/H'.

ANNEX II (PART-ARO)

ARO.GEN.005 Scope

Regulation (EU) No 965/2012

This Annex establishes requirements for the administration and management system to be fulfilled by the Agency and Member States for the implementation and enforcement of Regulation (EC) No 216/2008 and its Implementing Rules regarding civil aviation air operations.

SUBPART GEN: GENERAL REQUIREMENTS

SECTION I – GENERAL

ARO.GEN.115 Oversight documentation

Regulation (EU) No 965/2012

The competent authority shall provide all legislative acts, standards, rules, technical publications and related documents to relevant personnel in order to allow them to perform their tasks and to discharge their responsibilities.

ARO.GEN.120 Means of compliance

Regulation (EU) 2019/1384

- (a) The Agency shall develop acceptable means of compliance (AMC) that may be used to establish compliance with Regulation (EU) 2018/1139 and its delegated and implementing acts.
- (b) Alternative means of compliance may be used to establish compliance with Regulation (EU) 2018/1139 and its delegated and implementing acts.
- (c) The competent authority shall establish a system to consistently evaluate whether the alternative means of compliance used by itself or by organisations and persons under its oversight comply with Regulation (EU) 2018/1139 and its delegated and implementing acts. That system shall include procedures to limit, revoke or amend approved alternative means of compliance, if it has been demonstrated by the competent authority that those alternative means of compliance do not comply with Regulation (EU) 2018/1139 and delegated and implementing acts adopted on its basis.
- (d) The competent authority shall evaluate all alternative means of compliance proposed by an organisation in accordance:
 - (1) with point [ORO.GEN.120\(b\)](#) of Annex III (Part-ORO) to this Regulation;
 - (2) for balloons with point BOP.ADD.010 of Annex II (Part-BOP) to Commission Regulation (EU) 2018/395¹; or
 - (3) for sailplanes with point SAO.DEC.100(c) of Annex II (Part-SAO) to Commission Implementing Regulation (EU) 2018/1976²;

by analysing the documentation provided and, if considered necessary, conducting an inspection of the organisation.

When the competent authority finds that the alternative means of compliance are in accordance with the Implementing Rules, it shall without undue delay:

- (1) notify the applicant that the alternative means of compliance may be implemented and, if applicable, amend the approval, specialised operation authorisation or certificate of the applicant accordingly; and

¹ Commission Regulation (EU) 2018/395 of 13 March 2018 laying down detailed rules for the operation of balloons pursuant to Regulation (EC) No 216/2008 of the European Parliament and of the Council (OJ L 71, 14.3.2018, p. 10).

² Commission Implementing Regulation (EU) 2018/1976 of 14 December 2018 laying down detailed rules for the operation of sailplanes pursuant to Regulation (EU) 2018/1139 of the European Parliament and of the Council (OJ L 326, 20.12.2018, p. 64).

- (2) notify the Agency of their content, including copies of all relevant documentation.
- (e) When the competent authority itself uses alternative means of compliance to achieve compliance with Regulation (EC) No 216/2008 and its Implementing Rules it shall:
 - (1) make them available to all organisations and persons under its oversight; and
 - (2) without undue delay notify the Agency.

The competent authority shall provide the Agency with a full description of the alternative means of compliance, including any revisions to procedures that may be relevant, as well as an assessment demonstrating that the Implementing Rules are met.

AMC1 ARO.GEN.120(d)(3) Means of compliance

ED Decision 2014/025/R

GENERAL

The information to be provided to other Member States following approval of an alternative means of compliance should contain a reference to the Acceptable Means of Compliance (AMC) to which such means of compliance provides an alternative, as well as a reference to the corresponding Implementing Rule, indicating as applicable the subparagraph(s) covered by the alternative means of compliance.

AMC1 ARO.GEN.120(e) Means of compliance

ED Decision 2017/006/R

DEMONSTRATION OF COMPLIANCE

In order to demonstrate that the implementing rules are met, a risk assessment should be completed and documented. The result of this risk assessment should demonstrate that an equivalent level of safety to that established by the acceptable means of compliance (AMC) adopted by the Agency is reached.

GM1 ARO.GEN.120 Means of compliance

ED Decision 2014/025/R

GENERAL

Alternative means of compliance used by a competent authority or by organisations under its oversight may be used by other competent authorities or organisations only if processed again in accordance with [ARO.GEN.120\(d\) and \(e\)](#).

ARO.GEN.125 Information to the Agency

Regulation (EU) No 965/2012

- (a) The competent authority shall without undue delay notify the Agency in case of any significant problems with the implementation of Regulation (EC) No 216/2008 and its Implementing Rules.
- (b) The competent authority shall provide the Agency with safety-significant information stemming from the occurrence reports it has received.

ARO.GEN.135 Immediate reaction to a safety problem*Regulation (EU) 2019/1384*

- (a) Without prejudice to Regulation (EU) No 376/2014 of the European Parliament and of the Council¹, the competent authority shall implement a system to appropriately collect, analyse and disseminate safety information.
- (b) The Agency shall implement a system to appropriately analyse any relevant safety information received and without undue delay provide to Member States and the Commission any information, including recommendations or corrective actions to be taken, necessary for them to react in a timely manner to a safety problem involving products, parts, appliances, persons or organisations subject to Regulation (EC) No 216/2008 and its Implementing Rules.
- (c) Upon receiving the information referred to in (a) and (b), the competent authority shall take adequate measures to address the safety problem.
- (d) Measures taken under (c) shall immediately be notified to all persons or organisations which need to comply with them under Regulation (EC) No 216/2008 and its Implementing Rules. The competent authority shall also notify those measures to the Agency and, when combined action is required, the other Member States concerned.

SECTION II – MANAGEMENT**ARO.GEN.200 Management system***Regulation (EU) No 379/2014*

- (a) The competent authority shall establish and maintain a management system, including as a minimum:
 - (1) documented policies and procedures to describe its organisation, means and methods to achieve compliance with Regulation (EC) No 216/2008 and its Implementing Rules. The procedures shall be kept up to date and serve as the basic working documents within that competent authority for all related tasks;
 - (2) a sufficient number of personnel to perform its tasks and discharge its responsibilities. Such personnel shall be qualified to perform their allocated tasks and have the necessary knowledge, experience, initial and recurrent training to ensure continuing competence. A system shall be in place to plan the availability of personnel, in order to ensure the proper completion of all tasks;
 - (3) adequate facilities and office accommodation to perform the allocated tasks;
 - (4) a function to monitor compliance of the management system with the relevant requirements and adequacy of the procedures including the establishment of an internal audit process and a safety risk management process. Compliance monitoring shall include a feedback system of audit findings to the senior management of the competent authority to ensure implementation of corrective actions as necessary; and
 - (5) a person or group of persons, ultimately responsible to the senior management of the competent authority for the compliance monitoring function.

¹ Regulation (EU) No 376/2014 of the European Parliament and of the Council of 3 April 2014 on the reporting, analysis and follow-up of occurrences in civil aviation, amending Regulation (EU) No 996/2010 of the European Parliament and of the Council and repealing Directive 2003/42/EC of the European Parliament and of the Council and Commission Regulations (EC) No 1321/2007 and (EC) No 1330/2007 (OJ L 122, 24.4.2014, p. 18).

- (b) The competent authority shall, for each field of activity, including management system, appoint one or more persons with the overall responsibility for the management of the relevant task(s).
- (c) The competent authority shall establish procedures for participation in a mutual exchange of all necessary information and assistance with other competent authorities concerned including on all findings raised and follow-up actions taken as a result of oversight of persons and organisations exercising activities in the territory of a Member State, but certified or authorised by or making declarations to the competent authority of another Member State or the Agency.
- (d) A copy of the procedures related to the management system and their amendments shall be made available to the Agency for the purpose of standardisation.

AMC1 ARO.GEN.200(a) Management system

ED Decision 2014/025/R

GENERAL

- (a) All of the following should be considered when deciding upon the required organisational structure:
 - (1) the number of certificates, attestations, authorisations and approvals to be issued;
 - (2) the number of declared organisations;
 - (3) the number of certified or authorised persons and organisations exercising an activity within that Member State, including persons or organisations certified or authorised by other competent authorities;
 - (4) the possible use of qualified entities and of resources of other competent authorities to fulfil the continuing oversight obligations;
 - (5) the level of civil aviation activity in terms of:
 - (i) number and complexity of aircraft operated;
 - (ii) size and complexity of the Member State's aviation industry;
 - (6) the potential growth of activities in the field of civil aviation.
- (b) The set-up of the organisational structure should ensure that the various tasks and obligations of the competent authority do not rely solely on individuals. A continuous and undisturbed fulfilment of these tasks and obligations of the competent authority should also be guaranteed in case of illness, accident or leave of individual employees.

GM1 ARO.GEN.200(a) Management system

ED Decision 2014/025/R

GENERAL

- (a) The competent authority designated by each Member State should be organised in such a way that:
 - (1) there is specific and effective management authority in the conduct of all relevant activities;

- (2) the functions and processes described in the applicable requirements of Regulation (EC) No 216/2008¹ and its Implementing Rules and AMCs, Certification Specifications (CSs) and Guidance Material (GM) may be properly implemented;
 - (3) the competent authority's organisation and operating procedures for the implementation of the applicable requirements of Regulation (EC) No 216/2008 and its Implementing Rules are properly documented and applied;
 - (4) all competent authority personnel involved in the related activities are provided with training where necessary;
 - (5) specific and effective provision is made for the communication and interface as necessary with the Agency and the competent authorities of other Member States; and
 - (6) all functions related to implementing the applicable requirements are adequately described.
- (b) A general policy in respect of activities related to the applicable requirements of Regulation (EC) No 216/2008 and its Implementing Rules should be developed, promoted and implemented by the manager at the highest appropriate level; for example the manager at the top of the functional area of the competent authority that is responsible for such activities.
- (c) Appropriate steps should be taken to ensure that the policy is known and understood by all personnel involved, and all necessary steps should be taken to implement and maintain the policy.
- (d) The general policy, whilst also satisfying additional national regulatory responsibilities, should in particular take into account:
- (1) the provisions of Regulation (EC) No 216/2008;
 - (2) the provisions of the applicable Implementing Rules and their AMCs, CSs and GM;
 - (3) the needs of industry; and
 - (4) the needs of the Agency and of the competent authority.
- (e) The policy should define specific objectives for key elements of the organisation and processes for implementing related activities, including the corresponding control procedures and the measurement of the achieved standard.

AMC1 ARO.GEN.200(a)(1) Management system

ED Decision 2014/025/R

DOCUMENTED POLICIES AND PROCEDURES

- (a) The various elements of the organisation involved with the activities related to Regulation (EC) No 216/2008 and its Implementing Rules should be documented in order to establish a reference source for the establishment and maintenance of this organisation.
- (b) The documented procedures should be established in a way that facilitates their use. They should be clearly identified, kept up-to-date and made readily available to all personnel involved in the related activities.

¹ Regulation (EC) No 216/2008 of the European Parliament and of the Council of 20 February 2008 on common rules in the field of civil aviation and establishing a European Aviation Safety Agency, and repealing Council Directive 91/670/EEC, Regulation (EC) No 1592/2002 and Directive 2004/36/EC. OJ L 79, 19.3.2008, p. 1. Regulation as last amended by Commission Regulation (EU) No 6/2013 of 8 January 2013 (OJ L 4, 9.1.2013, p. 34).

- (c) The documented procedures should cover, as a minimum, all of the following aspects:
 - (1) policy and objectives;
 - (2) organisational structure;
 - (3) responsibilities and associated authority;
 - (4) procedures and processes;
 - (5) internal and external interfaces;
 - (6) internal control procedures;
 - (7) training of personnel;
 - (8) cross-references to associated documents;
 - (9) assistance from other competent authorities or the Agency (where required).
- (d) It is likely that the information is held in more than one document or series of documents, and suitable cross-referencing should be provided. For example, organisational structure and job descriptions are not usually in the same documentation as the detailed working procedures. In such cases, it is recommended that the documented procedures include an index of cross-references to all such other related information, and the related documentation should be readily available when required.

AMC1 ARO.GEN.200(a)(2) Management system

ED Decision 2017/006/R

QUALIFICATION AND TRAINING — GENERAL

- (a) It is essential that the competent authority has the full capability to adequately assess the continued competence of an organisation by ensuring that the whole range of activities is assessed by appropriately qualified personnel.
- (b) For each inspector, the competent authority should:
 - (1) define the competencies required to perform the allocated certification and oversight tasks;
 - (2) define the associated minimum qualification requirements;
 - (3) establish initial and recurrent training programmes in order to maintain and to enhance inspector competency at the level necessary to perform the allocated tasks; and
 - (4) ensure that the training provided meets the established standards and is regularly reviewed and updated whenever necessary.
- (c) The competent authority may provide training through its own training organisation with qualified trainers or through another qualified training source.
- (d) When training is not provided through an internal training organisation, adequately experienced and qualified persons may act as trainers, provided their training skills have been assessed. If required, an individual training plan should be established covering specific training skills. Records should be kept of such training and the assessment, as appropriate.

AMC2 ARO.GEN.200(a)(2) Management system

ED Decision 2017/006/R

QUALIFICATION AND TRAINING — INSPECTORS**(a) Initial training programme:**

The initial training programme for inspectors should include, as appropriate to their role, current knowledge, experience and skills in at least all of the following:

- (1) aviation legislation organisation and structure;
- (2) the Chicago Convention, relevant ICAO annexes and documents;
- (3) overview of Regulation (EC) No 216/2008, its implementing rules and the related AMC, CS, and GM;
- (4) Regulation (EU) No 965/2012 as well as other applicable requirements;
- (5) management systems, including the assessment of the effectiveness of a management system, in particular hazard identification and risk assessment, and non-punitive reporting techniques in the context of the implementation of a 'just culture';
- (6) auditing techniques;
- (7) competent authority procedures relevant to the inspectors' tasks;
- (8) human factors principles;
- (9) rights and obligations of inspecting personnel of the competent authority;
- (10) 'on-the-job' training, relevant to the inspector's tasks;
- (11) technical training, including training on aircraft-specific subjects, appropriate to the role and tasks of the inspector, in particular for those areas requiring approvals.

(b) Recurrent training programme:

Once qualified, the inspector should undergo training periodically as well as whenever deemed necessary by the competent authority in order to remain competent to perform the allocated tasks. The recurrent training programme for inspectors should include, as appropriate to their role, at least the following topics:

- (1) changes in aviation legislation, operational environment and technologies;
- (2) competent authority procedures relevant to the inspector's tasks;
- (3) technical training, including training on aircraft-specific subjects, appropriate to the role and tasks of the inspector; and
- (4) results from past oversight.

(c) An assessment of an inspector's competency should take place at regular intervals not exceeding three years.**AMC3 ARO.GEN.200(a)(2) Management system**

ED Decision 2015/022/R

QUALIFICATION AND TRAINING — CREW RESOURCE MANAGEMENT (CRM)

For the oversight of the operator's CRM training, the inspectors of the competent authority should be qualified and trained as follows:

(a) Qualification

To fulfil the qualification provisions, inspectors should:

- (1) have adequate knowledge of the relevant flight operations;
- (2) have adequate knowledge of human performance and limitations (HPL);
- (3) have completed initial CRM training;
- (4) have received additional training in the fields of group management, group dynamics and personal awareness; and
- (5) have experience in the assessment of the effectiveness of training programmes and management systems.

(b) Training

The training of inspectors should be both theoretical and practical, and should include:

- (1) in-depth knowledge of the CRM training elements as laid down in Part-ORO; and
- (2) specific skills for the oversight of the operator's CRM training including the assessment of non-technical skills using proper techniques and methodologies.

AMC4 ARO.GEN.200(a)(2) Management system¹

ED Decision 2017/006/R

INSPECTOR QUALIFICATION FOR CAT OPERATIONS

- (a) For CAT operations of aircraft with an MOPSC of more than 19 seats or with an MCTOM of more than 45 360 kg, an inspector who performs initial certification or oversight tasks relating to:
- (1) the flight crew operating procedures contained in Part B (e.g. Chapters B-2, B-3, and B-9) of the Operations Manual (OM), or
 - (2) the aircraft/FSTD part of the flight crew training syllabi and checking programmes contained in Part D of the OM,
- should have the following qualifications:
- (i) operational experience in air transport operations appropriate to the allocated tasks;
 - (ii) experience in either operational management within an air transport operation; or as an examiner; or as an instructor; and
 - (iii) hold or have held a valid type rating on the aircraft type concerned; or a class rating as appropriate; or a rating on aircraft types/classes with similar technical and operational characteristics.
- (b) For CAT operations with an MOPSC of 19 seats or less, the authority should establish the inspector qualifications required to perform the allocated initial certification and oversight tasks. The assigned inspector should undergo theoretical training on aircraft systems and operations.

¹ Please note that this AMC shall not apply to inspecting staff already qualified as inspector to perform oversight tasks, as per Article 3 of EASA [ED Decision 2017/006/R](#).

- (c) For in-flight inspections of CAT operations, the inspector should have relevant knowledge of the route and area.

AMC5 ARO.GEN.200(a)(2) Management system

ED Decision 2017/006/R

FATIGUE RISK MANAGEMENT INSPECTOR TRAINING

An inspector involved in the approval process of operator's flight time specification schemes and fatigue risk management (FRM) should receive the following training:

- (a) Initial training
- (1) Theory and effects of fatigue
 - (2) Human factors related to fatigue
 - (3) Typical hazards and risks related to fatigue, their possible mitigation measures, and the maturity of hazard identification models (reactive, proactive and predictive)
 - (4) FRM training and promotion methodologies and how to support ongoing development of FRM
 - (5) Data collection and analysis methods related to FRM
 - (6) Integration of FRM into the Management System
 - (7) Fatigue management documentation, implementation and assurance methodologies
 - (8) Regulatory framework and current best practices
 - (9) Auditing and assessment of the effectiveness of an operator's FRM
- (b) Recurrent training (at least every 3 years)
- (1) Review of FRM implementation issues
 - (2) Recent incidents related to fatigue
 - (3) New FRM developments
 - (4) Review of changes in legislation, and best practices.

GM1 ARO.GEN.200(a)(2) Management System

ED Decision 2017/006/R

SUFFICIENT PERSONNEL

- (a) This GM on the determination of the required personnel is limited to the performance of certification, authorisation and oversight tasks, excluding personnel required to perform tasks subject to any national regulatory requirements.
- (b) The elements to be considered when determining required personnel and planning their availability may be divided into quantitative and qualitative elements:
- (1) Quantitative elements:
 - (i) the estimated number of initial certificates to be issued;
 - (ii) the number of organisations certified by the competent authority;
 - (iii) the number of persons to whom the competent authority has issued a licence, certificate, rating, authorisation or attestation;

- (iv) the estimated number of persons and organisations, as well as the estimated number of subcontracted organisations used by those persons and organisations, exercising their activity within the territory of the Member State and established or residing in another Member State;
 - (v) the number of organisations having declared their activity to the competent authority;
 - (vi) the number of organisations holding a specialised operations authorisation issued by the competent authority.
- (2) Qualitative elements:
 - (i) the size, nature and complexity of activities of certified, authorised and declared organisations (cf. [AMC1 ORO.GEN.200\(b\)](#)), taking into account:
 - (A) privileges of the organisation;
 - (B) type of approval, scope of approval, multiple certification, authorisation and declared activities;
 - (C) possible certification to industry standards;
 - (D) types of aircraft/flight simulation training devices (FSTDs) operated;
 - (E) number of personnel; and
 - (F) organisational structure, existence of subsidiaries;
 - (ii) the safety priorities identified;
 - (iii) the results of past oversight activities, including audits, inspections and reviews, in terms of risks and regulatory compliance, taking into account:
 - (A) number and level of findings;
 - (B) timeframe for implementation of corrective actions; and
 - (C) maturity of management systems implemented by organisations and their ability to effectively manage safety risks, taking into account also information provided by other competent authorities related to activities in the territory of the Member States concerned; and
 - (iv) the size and complexity of the Member State's aviation industry and the potential growth of activities in the field of civil aviation, which may be an indication of the number of new applications and changes to existing certificates and authorisations to be expected.
- (c) Based on existing data from previous oversight planning cycles and taking into account the situation within the Member State's aviation industry, the competent authority may estimate:
 - (1) the standard working time required for processing applications for new certificates (for persons and organisations) and authorisations;
 - (2) the number of new declarations or changed declarations;
 - (3) the number of new certificates and authorisations to be issued for each planning period; and
 - (4) the number of changes to existing certificates and authorisations to be processed for each planning period.

-
- (d) In line with the competent authority's oversight policy, the following planning data should be determined specifically for each type of organisation certified by the competent authority as well as for declared organisations, including those being authorised:
- (1) standard number of audits to be performed per oversight planning cycle;
 - (2) standard duration of each audit;
 - (3) standard working time for audit preparation, on-site audit, reporting and follow-up, per inspector;
 - (4) standard number of ramp and unannounced inspections to be performed;
 - (5) standard duration of inspections, including preparation, reporting and follow-up, per inspector;
 - (6) minimum number and required qualification of inspectors for each audit/inspection.
- (e) Standard working time could be expressed either in working hours per inspector or in working days per inspector. All planning calculations should then be based on the same unit (hours or working days).
- (f) It is recommended to use a spreadsheet application to process data defined under (c) and (d), to assist in determining the total number of working hours/days per oversight planning cycle required for certification, authorisation, oversight and enforcement activities. This application could also serve as a basis for implementing a system for planning the availability of personnel.
- (g) For each type of organisation certified or high risk commercial specialised operation authorised by the competent authority, the number of working hours/days per planning period for each qualified inspector that may be allocated for certification, authorisation, oversight and enforcement activities should be determined, taking into account:
- (1) purely administrative tasks not directly related to oversight and certification/authorisation;
 - (2) training;
 - (3) participation in other projects;
 - (4) planned absence; and
 - (5) the need to include a reserve for unplanned tasks or unforeseeable events.
- (h) The determination of working time available for certification, authorisation, oversight and enforcement activities should also consider:
- (1) the possible use of qualified entities; and
 - (2) possible cooperation with other competent authorities for approvals or authorisations involving more than one Member State.
- (i) Based on the elements listed above, the competent authority should be able to:
- (1) monitor dates when audits and inspections are due and when they have been carried out;
 - (2) implement a system to plan the availability of personnel; and
 - (3) identify possible gaps between the number and qualification of personnel and the required volume of certification/authorisation and oversight.

Care should be taken to keep planning data up-to-date in line with changes in the underlying planning assumptions, with particular focus on risk-based oversight principles.

GM2 ARO.GEN.200(a)(2) Management system

ED Decision 2017/006/R

INSPECTOR COMPETENCY

- (a) Competency is a combination of individual skills, practical and theoretical knowledge, attitude, training, and experience.
- (b) An inspector should, by his/her qualifications and competencies, command the professional respect of the inspected personnel.

GM3 ARO.GEN.200(a)(2) Management system

ED Decision 2016/006/R

SPECIFIC FLIGHT OPERATIONS INSPECTOR QUALIFICATION

- (a) The following characteristics should be considered in order to establish aircraft types/classes with similar technical and operational characteristics:
 - (1) Engine technology;
 - (2) Certification basis;
 - (3) Level of automation;
 - (4) Flight controls logic (e.g. fly-by-wire, conventional, etc.); and
 - (5) Size and mass of the aircraft (e.g. maximum take-off mass, wake turbulence category, etc.).
- (b) The following factors should be considered with regard to knowledge of the route and area:
 - (1) Climatological conditions, e.g. exceptionally cold weather;
 - (2) Availability of adequate aerodromes and their specific features, e.g. high elevation, poor English/communication capability, exceptional approach procedures;
 - (3) Navigational procedures, including PBN requirements, ETOPS and extended diversion time requirements;
 - (4) Communication procedures, including required communication performance, any specific and contingency procedures, e.g. loss of communication, drift down, oxygen escape; and
 - (5) Equipment requirements related to search and rescue, e.g. polar, desert operations, oceanic, remote areas.

GM4 ARO.GEN.200(a)(2) Management system

ED Decision 2017/006/R

INSPECTOR TRAINING PROGRAMMES

- (a) The competent authority may adapt the duration and depth of the individual training programme of an inspector, provided the required competencies are achieved and maintained.
- (b) The following documents, as appropriate to the role of the inspector, are relevant for the initial training programme for inspectors referred to in [AMC2 ARO.GEN.200\(a\)\(2\)](#):

- (1) The Chicago Convention and relevant ICAO annexes and documents
- (2) Regulation (EU) No 376/2014 (Occurrences in civil aviation)
- (3) Regulation (EC) No 216/2008, and related implementing rules such as:
 - (i) Regulation (EU) No 1178/2011 (Air Crew Regulation);
 - (ii) Regulation (EU) No 1332/2011;(Part-AUR);
 - (iii) Regulation (EU) No 923/2012 (Part-SERA);
 - (iv) Regulation (EU) No 748/2012 (OSD); and
 - (v) Regulation (EU) No 1321/2014 (Part-M, Part-145).
- (c) The duration of the on-the-job training should take into account the scope and complexity of the inspector's tasks. The competent authority should assess whether the required competence has been achieved before an inspector is authorised to perform a task without supervision.

GM5 ARO.GEN.200(a)(2) Management system

ED Decision 2017/006/R

FATIGUE RISK MANAGEMENT INSPECTOR TRAINING

'Theory and effects of fatigue' refers to:

- (a) sleep;
- (b) circadian rhythm;
- (c) adaptation (acclimatisation) after time-jet zone crossing (westbound and eastbound) and jet lag;
- (d) shift work;
- (e) bio-mathematical fatigue models; and
- (f) measurement of fatigue.

GM6 ARO.GEN.200(a)(2) Management system

ED Decision 2017/006/R

FATIGUE RISK MANAGEMENT INSPECTOR TRAINING

Guidance on training for inspectors on fatigue risk management is contained in ICAO Doc 9966 (Manual for the Oversight of Fatigue Management Approaches).

GM7 ARO.GEN.200(a)(2) Management system

ED Decision 2017/006/R

INSPECTOR EXPERIENCE IN EITHER OPERATIONAL MANAGEMENT WITHIN AN AIR TRANSPORT OPERATION OR AS AN INSTRUCTOR OR AS AN EXAMINER

The inspector assigned to certification and oversight tasks should have sufficient experience in roles that enable a thorough understanding of the operational processes.

- (a) Experience in operational management refers to previous appointments in functions of organisational relevance, such as in any of the areas below:
 - (1) flight operations and operational control;

- (2) flight crew training; and
- (3) management system.

Such appointments should not be limited to senior management functions such as nominated persons in accordance with point (b) of [ORO.GEN.210](#). It is important that the inspector assigned to certification and oversight tasks in accordance with [AMC4 ARO.GEN.200\(a\)\(2\)](#) have sufficient experience which enables a thorough understanding of the operational processes within air transport operations.

- (b) In the context of the approval and oversight of aircraft specific flight crew training and checking, the inspector should have experience as an instructor.

AMC1 ARO.GEN.200(d) Management system

ED Decision 2014/025/R

PROCEDURES AVAILABLE TO THE AGENCY

- (a) Copies of the procedures related to the competent authority's management system and their amendments to be made available to the Agency for the purpose of standardisation should provide at least the following information:
 - (1) Regarding continuing oversight functions undertaken by the competent authority, the competent authority's organisational structure with description of the main processes. This information should demonstrate the allocation of responsibilities within the competent authority, and that the competent authority is capable of carrying out the full range of tasks regarding the size and complexity of the Member State's aviation industry. It should also consider overall proficiency and authorisation scope of competent authority personnel.
 - (2) For personnel involved in oversight activities, the minimum professional qualification requirements and experience and principles guiding appointment (e.g. assessment).
 - (3) How the following are carried out: assessing applications and evaluating compliance, issuance of certificates and authorisations, performance of continuing oversight, follow-up of findings, enforcement measures and resolution of safety concerns.
 - (4) Principles of managing exemptions and derogations.
 - (5) Processes in place to disseminate applicable safety information for timely reaction to a safety problem.
 - (6) Criteria for planning continuing oversight (oversight programme), including adequate management of interfaces when conducting continuing oversight (air operations, flight crew licensing, continuing airworthiness management for example).
 - (7) Outline of the initial training of newly recruited oversight personnel (taking future activities into account), and the basic framework for continuation training of oversight personnel.
- (b) As part of the continuous monitoring of a competent authority, the Agency may request details of the working methods used, in addition to the copy of the procedures of the competent authority's management system (and amendments). These additional details are the procedures and related guidance material describing working methods for competent authority personnel conducting oversight.
- (c) Information related to the competent authority's management system may be submitted in electronic format.

ARO.GEN.205 Allocation of tasks to qualified entities

Regulation (EU) No 379/2014

- (a) Tasks related to the initial certification, specialised operation authorisation or continuing oversight of persons or organisations subject to Regulation (EC) No 216/2008 and its Implementing Rules shall be allocated by Member States only to qualified entities. When allocating tasks, the competent authority shall ensure that it has:
- (1) put a system in place to initially and continuously assess that the qualified entity complies with Annex V to Regulation (EC) No 216/2008.
This system and the results of the assessments shall be documented.
 - (2) established a documented agreement with the qualified entity, approved by both parties at the appropriate management level, which clearly defines:
 - (i) the tasks to be performed;
 - (ii) the declarations, reports and records to be provided;
 - (iii) the technical conditions to be met in performing such tasks;
 - (iv) the related liability coverage; and
 - (v) the protection given to information acquired in carrying out such tasks.
- (b) The competent authority shall ensure that the internal audit process and safety risk management process required by [ARO.GEN.200\(a\)\(4\)](#) covers all certification, authorisation or continuing oversight tasks performed on its behalf.

ARO.GEN.210 Changes in the management system

Regulation (EU) No 965/2012

- (a) The competent authority shall have a system in place to identify changes that affect its capability to perform its tasks and discharge its responsibilities as defined in Regulation (EC) No 216/2008 and its Implementing Rules. This system shall enable it to take action as appropriate to ensure that its management system remains adequate and effective.
- (b) The competent authority shall update its management system to reflect any change to Regulation (EC) No 216/2008 and its Implementing Rules in a timely manner, so as to ensure effective implementation.
- (c) The competent authority shall notify the Agency of changes affecting its capability to perform its tasks and discharge its responsibilities as defined in Regulation (EC) No 216/2008 and its Implementing Rules.

ARO.GEN.220 Record-keeping

Regulation (EU) 2015/140

- (a) The competent authority shall establish a system of record-keeping providing for adequate storage, accessibility and reliable traceability of:
- (1) the management system's documented policies and procedures;
 - (2) training, qualification and authorisation of its personnel;
 - (3) the allocation of tasks, covering the elements required by [ARO.GEN.205](#) as well as the details of tasks allocated;

- (4) certification processes and continuing oversight of certified organisations;
 - (4a) the process of authorisation of a high risk commercial specialised operation and continuing oversight of an authorisation holder;
 - (5) declaration processes and continuing oversight of declared organisations;
 - (6) details of training courses provided by certified organisations, and if applicable, records relating to FSTDs used for such training;
 - (7) oversight of persons and organisations exercising activities within the territory of the Member State, but overseen, certified or authorised by the competent authority of another Member State or the Agency, as agreed between these authorities;
 - (8) oversight of operations of other-than complex motor-powered aircraft by non-commercial operators;
 - (9) the evaluation and notification to the Agency of alternative means of compliance proposed by organisations subject to certification, or authorisation and the assessment of alternative means of compliance used by the competent authority itself;
 - (10) findings, corrective actions and date of action closure;
 - (11) enforcement measures taken;
 - (12) safety information and follow-up measures; and
 - (13) the use of flexibility provisions in accordance with Article 14 of Regulation (EC) No 216/2008.
- (b) The competent authority shall maintain a list of all organisation certificates and specialised operations authorisations it issued as well as declarations it received.
- (c) All records shall be kept for the minimum period specified in this Regulation. In the absence of such indication, records shall be kept for a minimum period of five years subject to applicable data protection law.

AMC1 ARO.GEN.220(a) Record-keeping

ED Decision 2014/025/R

GENERAL

- (a) The record-keeping system should ensure that all records are accessible whenever needed within a reasonable time. These records should be organised in a way that ensures traceability and retrievability throughout the required retention period.
- (b) Records should be kept in paper form or in electronic format or a combination of both media. Records stored on microfilm or optical disc form are also acceptable. The records should remain legible and accessible throughout the required retention period. The retention period starts when the record has been created.
- (c) Paper systems should use robust material, which can withstand normal handling and filing. Computer systems should have at least one backup system, which should be updated within 24 hours of any new entry. Computer systems should include safeguards against unauthorised alteration of data.
- (d) All computer hardware used to ensure data backup should be stored in a different location from that containing the working data and in an environment that ensures they remain in good condition. When hardware or software changes take place, special care should be taken that all

necessary data continue to be accessible at least through the full period specified in the relevant Subpart or by default in [ARO.GEN.220\(c\)](#).

AMC1 ARO.GEN.220(a)(1);(2);(3) Record-keeping

ED Decision 2014/025/R

COMPETENT AUTHORITY MANAGEMENT SYSTEM

Records related to the competent authority's management system should include, as a minimum and as applicable:

- (a) the documented policies and procedures;
- (b) the personnel files of competent authority personnel, with supporting documents related to training and qualifications;
- (c) the results of the competent authority's internal audit and safety risk management processes, including audit findings and corrective actions; and
- (d) the contract(s) established with qualified entities performing certification, authorisation or oversight tasks on behalf of the competent authority.

AMC1 ARO.GEN.220(a)(4);(4a) Record-keeping

ED Decision 2014/025/R

ORGANISATIONS

Records related to an organisation certified or operations authorised by or having declared its activity to the competent authority should include, as appropriate to the type of organisation:

- (a) the application for an organisation approval, a specialised operation authorisation or the declaration received;
- (b) the documentation based on which the approval or authorisation has been granted and any amendments to that documentation;
- (c) the organisation approval certificate or specialised operation authorisation, including any changes;
- (d) a copy of the continuing oversight programme listing the dates when audits are due and when such audits were carried out;
- (e) continuing oversight records, including all audit and inspection records;
- (f) copies of all relevant correspondence;
- (g) details of any exemption and enforcement actions;
- (h) any report from other competent authorities relating to the oversight of the organisation; and
- (i) a copy of any other document approved by the competent authority.

GM1 ARO.GEN.220(a)(4) Record-keeping

ED Decision 2014/025/R

ORGANISATIONS — DOCUMENTATION

Documentation to be kept as records in support of the approval includes the management system documentation, including any technical manuals, such as the operations manual, and training manual, that have been submitted with the initial application, and any amendments to these documents.

GM1 ARO.GEN.220(a)(4a) Record-keeping

ED Decision 2014/025/R

AUTHORISATION HOLDERS — DOCUMENTATION

Documentation to be kept as records in support of the authorisation of a high risk commercial specialised operation include the risk assessment documentation and related standard operating procedures (SOP), as well as a description of the management system of the proposed operation and a statement that all the documentation sent to the competent authority has been verified by the operator and found in compliance with the applicable requirements. Any amendments to these documents should be documented.

AMC1 ARO.GEN.220(a)(7) Record-keeping

ED Decision 2014/025/R

ACTIVITIES PERFORMED IN THE TERRITORY OF A MEMBER STATE BY PERSONS OR ORGANISATIONS ESTABLISHED OR RESIDING IN ANOTHER MEMBER STATE

- (a) Records related to the oversight of activities performed in the territory of a Member State by persons or organisations established or residing in another Member State should include, as a minimum:
 - (1) oversight records, including all audit and inspection records and related correspondence;
 - (2) copies of all relevant correspondence to exchange information with other competent authorities relating to the oversight of such persons/organisations;
 - (3) details of any enforcement measures and penalties; and
 - (4) any report from other competent authorities relating to the oversight of these persons/organisations, including any notification of evidence showing non-compliance with the applicable requirements.
- (b) Records should be kept by the competent authority having performed the audit or inspection and should be made available to other competent authorities at least in the following cases:
 - (1) serious incidents or accidents;
 - (2) findings through the oversight programme where organisations certified or authorised by another competent authority are involved, to determine the root cause;
 - (3) an organisation being certified, authorised or having approvals in several Member States.
- (c) When records are requested by another competent authority, the reason for the request should be clearly stated.
- (d) The records can be made available by sending a copy or by allowing access to them for consultation.

GM1 ARO.GEN.220 Record-keeping

ED Decision 2014/025/R

GENERAL

Records are required to document results achieved or to provide evidence of activities performed. Records become factual when recorded. Therefore, they are not subject to version control. Even when a new record is produced covering the same issue, the previous record remains valid.

SECTION III – OVERSIGHT, CERTIFICATION AND ENFORCEMENT

ARO.GEN.300 Oversight

Regulation (EU) 2019/1384

- (a) The competent authority shall verify:
- (1) compliance with the requirements applicable to organisations or type of operations prior to the issue of a certificate, approval or authorisation, as applicable;
 - (2) continued compliance with the applicable requirements of organisations it has certified, specialised operations it has authorised and organisations from which it received a declaration;
 - (3) continued compliance with the applicable requirements of non-commercial operators of other-than complex motor-powered aircraft; and
 - (4) implementation of appropriate safety measures mandated by the competent authority as defined in [ARO.GEN.135\(c\) and \(d\)](#).
- (b) This verification shall:
- (1) be supported by documentation specifically intended to provide personnel responsible for safety oversight with guidance to perform their functions;
 - (2) provide the persons and organisations concerned with the results of safety oversight activity;
 - (3) be based on audits and inspections, including ramp and unannounced inspections; and
 - (4) provide the competent authority with the evidence needed in case further action is required, including the measures foreseen by [ARO.GEN.350](#) and [ARO.GEN.355](#).
- (c) The scope of oversight defined in (a) and (b) shall take into account the results of past oversight activities and the safety priorities.
- (d) Without prejudice to the competences of the Member States and to their obligations as set out in ARO.RAMP, the scope of the oversight of activities performed in the territory of a Member State by persons or organisations established or residing in another Member State shall be determined on the basis of the safety priorities, as well as of past oversight activities.
- (e) Where the activity of a person or organisation involves more than one Member State or the Agency, the competent authority responsible for the oversight under (a) may agree to have oversight tasks performed by the competent authority(ies) of the Member State(s) where the activity takes place or by the Agency. Any person or organisation subject to such agreement shall be informed of its existence and of its scope.
- (f) The competent authority shall collect and process any information deemed useful for oversight, including for ramp and unannounced inspections.

AMC1 ARO.GEN.300(a);(b);(c) Oversight

ED Decision 2017/006/R

GENERAL

The competent authority should assess the organisation and monitor its continued competence to conduct safe operations in compliance with the applicable requirements. The competent authority should ensure that accountability for assessing organisations is clearly defined. This accountability

may be delegated or shared, in whole or in part. Where more than one competent authority is involved, a responsible person should be appointed under whose personal authority organisations are assessed.

AMC2 ARO.GEN.300(a);(b);(c) Oversight

ED Decision 2014/025/R

EVALUATION OF OPERATIONAL SAFETY RISK ASSESSMENT

As part of the initial certification or the continuing oversight of an operator, the competent authority should normally evaluate the operator's safety risk assessment processes related to hazards identified by the operator as having an interface with its operations. These safety risk assessments should be identifiable processes of the operator's management system.

As part of its continuing oversight, the competent authority should also remain satisfied as to the effectiveness of these safety risk assessments.

(a) General methodology for operational hazards

The competent authority should establish a methodology for evaluating the safety risk assessment processes of the operator's management system.

When related to operational hazards, the competent authority's evaluation under its normal oversight process should be considered satisfactory if the operator demonstrates its competence and capability to:

- (1) understand the hazards and their consequences on its operations;
- (2) be clear on where these hazards may exceed acceptable safety risk limits;
- (3) identify and implement mitigations, including suspension of operations where mitigation cannot reduce the risk to within safety risk limits;
- (4) develop and execute effectively robust procedures for the preparation and the safe operation of the flights subject to the hazards identified;
- (5) assess the competence and currency of its staff in relation to the duties necessary for the intended operations and implement any necessary training; and
- (6) ensure sufficient numbers of qualified and competent staff for such duties.

The competent authority should take into account that:

- (1) the operator's recorded mitigations for each unacceptable risk identified are in place;
- (2) the operational procedures specified by the operator with the most significance to safety appear to be robust; and
- (3) the staff on which the operator depends in respect of those duties necessary for the intended operations are trained and assessed as competent in the relevant procedures.

EVALUATION OF OPERATORS' VOLCANIC ASH SAFETY RISK ASSESSMENT

In addition to the general methodology for operational hazards, the competent authority's evaluation under its normal oversight process should also assess the operator's competence and capability to:

- (a) choose the correct information sources to use to interpret the information related to volcanic ash contamination forecast and to resolve correctly any conflicts among such sources; and

- (b) take account of all information from its type certificate holders (TCHs) concerning volcanic ash-related airworthiness aspects of the aircraft it operates, and the related pre-flight, in-flight and post flight precautions to be observed.

GM1 ARO.GEN.300(a);(b);(c) Oversight

ED Decision 2017/006/R

GENERAL

- (a) Responsibility for the conduct of safe operations lies with the organisation. Under these provisions a positive move is made towards devolving upon the organisation a share of the responsibility for monitoring the safety of operations. The objective cannot be attained unless organisations are prepared to accept the implications of this policy, including that of committing the necessary resources to its implementation. Crucial to the success of the policy is the content of Part-ORO, which requires the establishment of a management system by the organisation.
- (b) The competent authority should continue to assess the organisation's compliance with the applicable requirements, including the effectiveness of the management system. If the management system is judged to have failed in its effectiveness, then this in itself is a breach of the requirements which may, among others, call into question the validity of a certificate, if applicable.
- (c) The accountable manager is accountable to the competent authority as well as to those who may appoint him/her. It follows that the competent authority cannot accept a situation in which the accountable manager is denied sufficient funds, manpower or influence to rectify deficiencies identified by the management system.
- (d) Oversight of the organisation includes a review and assessment of the qualifications of nominated persons.

GM2 ARO.GEN.300(a);(b);(c) Oversight

ED Decision 2014/025/R

VOLCANIC ASH SAFETY RISK ASSESSMENT — ADDITIONAL GUIDANCE

Further guidance on the assessment of an operator's volcanic ash safety risk assessment is given in ICAO Doc 9974 (Flight safety and volcanic ash — Risk management of flight operations with known or forecast volcanic ash contamination).

GM3 ARO.GEN.300(a);(b);(c) Oversight

ED Decision 2015/022/R

CHECKLIST FOR CRM TRAINING OVERSIGHT

The following list includes the major elements for the monitoring of the operator's CRM training:

- (a) development of CRM training considering the operator's management system;
- (b) content of the CRM training syllabus;
- (c) qualification of CRM trainer;
- (d) training facilities:
 - (1) classroom;
 - (2) flight simulation training device (FSTD);

- (3) aircraft; and
- (4) cabin training device;
- (e) training methods:
 - (1) classroom training (instructions, presentations and behavioural exercises);
 - (2) computer-based training (CBT);
 - (3) line-oriented flight training (LOFT); and
 - (4) check or test;
- (f) training analysis:
 - (1) pre-course reading and study;
 - (2) integration of the different training methods;
 - (3) competence and performance of the trainer or instructor;
 - (4) assessment of flight crew members; and
 - (5) effectiveness of training.

GM4 ARO.GEN.300(a);(b);(c) Oversight

ED Decision 2016/008/R

OVERSIGHT OF AN OPERATOR CONVERSION COURSE (OCC) FOR MULTI-CREW PILOT LICENCE (MPL) HOLDERS

As part of the initial certification or the continuing oversight of an operator, the competent authority should include the assessment of the OCC provided to MPL holders, who undertake their first conversion course on a new type or at an operator other than the one that was involved in their training for the MPL.

The assessment of the OCC should evaluate whether the operator, in the process of development of the OCC, took the following aspects into account:

- the time elapsed after completion of the initial training, between base training and hiring, and the Line Flying Under Supervision (LIFUS);
- the necessary feedback loop between the Approved Training Organisation (ATO) and the operator involved in the licence training.

AMC1 ARO.GEN.300(a)(2) Oversight

ED Decision 2014/025/R

OPERATIONAL APPROVALS ISSUED BY NON-EU STATE OF REGISTRY

When verifying continued compliance of non-commercial operators using an aircraft registered in a third country holding operational approvals for operations in PBN, MNPS and RVSM airspace issued by a non-EU State of Registry, the competent authority should at least assess if:

- (a) the State of registry has established an equivalent level of safety, considering any differences notified to the ICAO Standards for RVSM, RNP, MNPS and MEL; or
- (b) there are reservations on the safety oversight capabilities and records of the State of registry; or
- (c) operators of the State of registry are subject to an operating ban pursuant Regulation (EC) No 2111/2005; or

- (d) relevant findings on the State of registry from audits carried out under international conventions exist; or
- (e) relevant findings on the State of registry from other safety assessment programmes of States exist.

GM1 ARO.GEN.300(d) Oversight

ED Decision 2014/025/R

ACTIVITIES WITHIN THE TERRITORY OF THE MEMBER STATE

- (a) Activities performed in the territory of the Member State by persons or organisations established or residing in another Member State include:
 - (1) activities of:
 - (i) organisations certified or authorised by or declaring their activity to the competent authority of any other Member State or the Agency; or
 - (ii) persons performing operations with other-than-complex motor-powered aircraft; and
 - (2) activities of persons holding a licence, certificate, rating, or attestation issued by the competent authority of any other Member State.
- (b) Audits and inspections of such activities, including ramp and unannounced inspections, should be prioritised towards those areas of greater safety concern, as identified through the analysis of data on safety hazards and their consequences in operations.

ARO.GEN.305 Oversight programme

Regulation (EU) 2015/140

- (a) The competent authority shall establish and maintain an oversight programme covering the oversight activities required by [ARO.GEN.300](#) and by ARO.RAMP.
- (b) For organisations certified by the competent authority, the oversight programme shall be developed taking into account the specific nature of the organisation, the complexity of its activities, the results of past certification and/or oversight activities required by ARO.GEN and ARO.RAMP and shall be based on the assessment of associated risks. It shall include within each oversight planning cycle:
 - (1) audits and inspections, including ramp and unannounced inspections as appropriate; and
 - (2) meetings convened between the accountable manager and the competent authority to ensure both remain informed of significant issues.
- (c) For organisations certified by the competent authority an oversight planning cycle not exceeding 24 months shall be applied.

The oversight planning cycle may be reduced if there is evidence that the safety performance of the organisation has decreased.

The oversight planning cycle may be extended to a maximum of 36 months if the competent authority has established that, during the previous 24 months:

- (1) the organisation has demonstrated an effective identification of aviation safety hazards and management of associated risks;

- (2) the organisation has continuously demonstrated under [ORO.GEN.130](#) that it has full control over all changes;
- (3) no level 1 findings have been issued; and
- (4) all corrective actions have been implemented within the time period accepted or extended by the competent authority as defined in [ARO.GEN.350\(d\)\(2\)](#).

The oversight planning cycle may be further extended to a maximum of 48 months if, in addition to the above, the organisation has established, and the competent authority has approved, an effective continuous reporting system to the competent authority on the safety performance and regulatory compliance of the organisation itself.

- (d) For organisations declaring their activity to the competent authority, the oversight programme shall be based on the specific nature of the organisation, the complexity of its activities and the data of past oversight activities and the assessment of risks associated with the type of activity carried out. It shall include audits and inspections, including ramp and unannounced inspections, as appropriate.
- (d1) For organisations holding a specialised operations authorisation, the oversight programme shall be established in accordance with (d) and shall also take into account the past and current authorisation process and the validity period of the authorisation.
- (e) For persons holding a licence, certificate, rating, or attestation issued by the competent authority the oversight programme shall include inspections, including unannounced inspections, as appropriate.
- (f) The oversight programme shall include records of the dates when audits, inspections and meetings are due and when such audits, inspections and meetings have been carried out.

AMC1 ARO.GEN.305(b);(d);(d1) Oversight programme

ED Decision 2017/006/R

SPECIFIC NATURE AND COMPLEXITY OF THE ORGANISATION, RESULTS OF PAST OVERSIGHT

- (a) When determining the oversight programme for an organisation, the competent authority should consider in particular the following elements, as applicable:
 - (1) the implementation by the organisation of industry standards, directly relevant to the organisation's activity subject to this Regulation;
 - (2) the procedure applied for and scope of changes not requiring prior approval;
 - (3) specific approvals held by the organisation;
 - (4) specific procedures implemented by the organisation related to any alternative means of compliance used; and
 - (5) number of subcontractors.
- (b) For the purpose of assessing the complexity of an organisation's management system, [AMC1 ORO.GEN.200\(b\)](#) should be used.
- (c) Regarding results of past oversight, the competent authority should also take into account relevant results of ramp inspections of organisations it has certified or authorised, persons and other organisation having declared their activity or persons performing operations with other-than-complex motor-powered aircraft that were performed in other Member States in accordance with ARO.RAMP.

AMC2 ARO.GEN.305(b) Oversight programme

ED Decision 2019/019/R

PROCEDURES FOR OVERSIGHT OF OPERATIONS

- (a) Each organisation to which a certificate has been issued should have an inspector specifically assigned to it. Several inspectors should be required for the larger companies with widespread or varied types of operation. This does not prevent a single inspector being assigned to several companies. Where more than one inspector is assigned to an organisation, one of them should be nominated as having overall responsibility for supervision of, and liaison with, the organisation's management, and be responsible for reporting on compliance with the requirements for its operations as a whole.
- (b) Audits and inspections, on a scale and frequency appropriate to the operation, should cover at least:
 - (1) infrastructure,
 - (2) manuals,
 - (3) training,
 - (4) crew records,
 - (5) equipment,
 - (6) release of flight/dispatch,
 - (7) dangerous goods,
 - (8) organisation's management system.
- (c) The following types of inspections should be included, as part of the oversight programme:
 - (1) flight inspection,
 - (2) ground inspection (e.g. documents and records),
 - (3) training inspection (e.g. ground, aircraft/FSTD),
 - (4) ramp inspection.

The inspection should be a 'deep cut' through the items selected, and all findings should be recorded. Inspectors should review the root cause(s) identified by the organisation for each confirmed finding.

The competent authority should be satisfied that the root cause(s) identified and the corrective actions taken are adequate to correct the non-compliance and to prevent re-occurrence.

- (d) Audits and inspections may be conducted separately or in combination. Audits and inspections may, at the discretion of the competent authority, be conducted with or without prior notice to the organisation.
- (e) Where it is apparent to an inspector that an organisation has permitted a breach of the applicable requirements, with the result that air safety has, or might have, been compromised, the inspector should ensure that the responsible person within the competent authority is informed without delay.
- (f) In the first few months of a new operation, inspectors should carry out oversight activities with a particular focus on the operator's procedures, facilities, equipment, operational control and management system. They should also carefully examine any conditions that may indicate a significant deterioration in the organisation's financial management. When any financial

difficulties are identified, inspectors should increase technical surveillance of the operation with particular emphasis on the upholding of safety standards.

- (g) The number or the magnitude of the non-compliances identified by the competent authority will serve to support the competent authority's continuing confidence in the organisation's competence or, alternatively, may lead to an erosion of that confidence. In the latter case, the competent authority should review any identifiable shortcomings of the management system.

GM1 ARO.GEN.305(b) Oversight programme

ED Decision 2014/025/R

FINANCIAL MANAGEMENT

Examples of trends that may indicate problems in a new organisation's financial management are:

- (a) significant lay-offs or turnover of personnel;
- (b) delays in meeting payroll;
- (c) reduction of safe operating standards;
- (d) decreasing standards of training;
- (e) withdrawal of credit by suppliers;
- (f) inadequate maintenance of aircraft;
- (g) shortage of supplies and spare parts;
- (h) curtailment or reduced frequency of revenue flights; and
- (i) sale or repossession of aircraft or other major equipment items.

GM1 ARO.GEN.305(b);(c);(d);(d1) Oversight programme

ED Decision 2017/006/R

STORAGE PERIODS OF RECORDS

If the organisation's oversight cycle has been extended, the minimum storage periods for records should be aligned with the extended oversight cycle to ensure that the competent authority has access to all relevant records.

AMC1 ARO.GEN.305(b)(1) Oversight programme

ED Decision 2014/025/R

AUDIT

- (a) The oversight programme should indicate which aspects of the approval will be covered with each audit.
- (b) Part of an audit should concentrate on the organisation's compliance monitoring reports produced by the compliance monitoring personnel to determine if the organisation is identifying and correcting its problems.
- (c) At the conclusion of the audit, an audit report should be completed by the auditing inspector, including all findings raised.

AMC2 ARO.GEN.305(b)(1) Oversight programme

ED Decision 2014/025/R

RAMP INSPECTIONS

- (a) When conducting a ramp inspection of aircraft used by organisations under its regulatory oversight, the competent authority should, as far as possible, comply with the requirements defined in ARO.RAMP.
- (b) When conducting ramp inspections on other-than-suspected aircraft, the competent authority should take into account the following elements:
 - (1) repeated inspections should be avoided of those organisations for which previous inspections have not revealed safety deficiencies;
 - (2) the oversight programme should enable the widest possible sampling rate of aircraft flying into their territory; and
 - (3) there should be no discrimination on the basis of the organisation's nationality, the type of operation or type of aircraft, unless such criteria can be linked to an increased risk.
- (c) For aircraft other than those used by organisations under its regulatory oversight, when conducting a risk assessment, the competent authority should consider aircraft that have not been ramp inspected for more than 6 months.

AMC1 ARO.GEN.305(b);(c);(d);(d1) Oversight programme

ED Decision 2014/025/R

INDUSTRY STANDARDS

- (a) For organisations having demonstrated compliance with industry standards, the competent authority may adapt its oversight programme, in order to avoid duplication of specific audit items.
- (b) Demonstrated compliance with industry standards should not be considered in isolation from the other elements to be considered for the competent authority's risk-based oversight.
- (c) In order to be able to credit any audits performed as part of certification in accordance with industry standards, the following should be considered:
 - (1) the demonstration of compliance is based on certification auditing schemes providing for independent and systematic verification;
 - (2) the existence of an accreditation scheme and accreditation body for certification in accordance with the industry standards has been verified;
 - (3) certification audits are relevant to the requirements defined in Annex III (Part-ORO) and other Annexes to this Regulation as applicable;
 - (4) the scope of such certification audits can easily be mapped against the scope of oversight in accordance with Annex III (Part-ORO);
 - (5) audit results are accessible to the competent authority and open to exchange of information in accordance with Article 15(1) of Regulation (EC) No 216/2008; and
 - (6) the audit planning intervals of certification audits i.a.w. industry standards are compatible with the oversight planning cycle.

AMC1 ARO.GEN.305(c) Oversight programme

ED Decision 2014/025/R

OVERSIGHT PLANNING CYCLE

- (a) When determining the oversight planning cycle and defining the oversight programme, the competent authority should assess the risks related to the activity of each organisation and adapt the oversight to the level of risk identified and to the organisation's ability to effectively manage safety risks.
- (b) The competent authority should establish a schedule of audits and inspections appropriate to each organisation's business. The planning of audits and inspections should take into account the results of the hazard identification and risk assessment conducted and maintained by the organisation as part of the organisation's management system. Inspectors should work in accordance with the schedule provided to them.
- (c) When the competent authority, having regard to an organisation's safety performance, varies the frequency of an audit or inspection, it should ensure that all aspects of the operation are audited and inspected within the applicable oversight planning cycle.
- (d) The section(s) of the oversight programme dealing with ramp inspections should be developed based on geographical locations, taking into account aerodrome activity, and focusing on key issues that can be inspected in the time available without unnecessarily delaying the operations.

AMC2 ARO.GEN.305(c) Oversight programme

ED Decision 2017/006/R

OVERSIGHT PLANNING CYCLE

- (a) For each organisation certified by the competent authority all processes should be completely audited at periods not exceeding the applicable oversight planning cycle. The beginning of the first oversight planning cycle is normally determined by the date of issue of the first certificate. If the competent authority wishes to align the oversight planning cycle with the calendar year, it should shorten the first oversight planning cycle accordingly.
- (b) The interval between two audits for a particular process should not exceed the interval of the applicable oversight planning cycle.
- (c) Audits should include at least one on-site audit within each oversight planning cycle. For organisations exercising their regular activity at more than one site, the determination of the sites to be audited should consider the results of past oversight, the volume of activity at each site, as well as main risk areas identified.
- (d) For organisations holding more than one certificate, the competent authority may define an integrated oversight schedule to include all applicable audit items. In order to avoid duplication of audits, credit may be granted for specific audit items already completed during the current oversight planning cycle, subject to four conditions:
 - (1) the specific audit item should be the same for all certificates under consideration;
 - (2) there should be satisfactory evidence on record that such specific audit items were carried out and that all corrective actions have been implemented to the satisfaction of the competent authority;
 - (3) the competent authority should be satisfied that there is no evidence that standards have deteriorated in respect of those specific audit items being granted a credit;

- (4) the interval between two audits for the specific item being granted a credit should not exceed the applicable oversight planning cycle.

AMC1 ARO.GEN.305(d) Oversight programme

ED Decision 2014/025/R

OVERSIGHT DECLARED ORGANISATIONS

- (a) When determining the oversight programme of organisations having declared their activity, the competent authority should make a selection of operators to be inspected/audited based on the elements specified in [ARO.GEN.305\(d\)](#).
- (b) For each selected operator an inspection is a sample inspection of the pre-defined inspection criteria on the basis of key risk elements and the applicable requirements.
- (c) The results of past oversight activities should include information from approval activities, e.g. SPA or from other survey programmes such as ACAM.
- (d) The oversight programme should also include a certain percentage of unannounced inspections.
- (e) The oversight programme should be developed on a yearly basis. All operators should be considered for inclusion into the programme not later than 12 months after the date of the first declaration received. At least one inspection should be performed within each 48-month cycle starting with the date of the first declaration received.
- (f) Additional audit/inspections to specific operators may be included in the oversight programme on the basis of the assessment of associated risks carried out within the occurrences reporting scheme(s).

AMC1 ARO.GEN.305(d1) Oversight programme

ED Decision 2014/025/R

OVERSIGHT OF AUTHORISATION HOLDERS

- (a) When determining the oversight programme of high risk commercial specialised operators holding an authorisation specialised operations authorisation holders, the competent authority should assess the risks related to the type of activity carried out by each organisation and adapt the oversight to the level of risk identified and to the organisation's ability to effectively manage safety risks.
- (b) An oversight cycle not exceeding 24 months should be applied. The oversight planning cycle may be extended to a maximum of 48 months if the competent authority has established that during the previous 24 months the organisation has been able to effectively manage safety risks.
- (c) The competent authority should establish a schedule of audits and/or inspections, including unannounced inspections, appropriate to each organisation's business. The planning of audits and inspections should take into account the results of the hazard identification and risk assessment conducted and maintained by the organisation as part of the organisation's management system. Inspectors should work in accordance with the schedule provided to them.
- (d) If the specialised operations authorisation is time limited, the competent authority should adapt the schedule of audits and inspections to the duration of the specialised operation authorisation. Audits or inspections may not be necessary if an authorisation is issued for a single flight or event.

- (e) When scheduling audits and inspections, the competent authority should also take into account the activity conducted by authorised organisations in other Member States. In this case the competent authority should coordinate the audit and inspection schedule with the authority of the Member State in which territory the activity is taking place.
- (f) Additional audits or inspections to specific operators may be included in the oversight programme on the basis of the assessment of associated risks carried out within the occurrences reporting scheme(s).

GM1 ARO.GEN.305(d1) Oversight programme

ED Decision 2014/025/R

OVERSIGHT OF AUTHORISATION HOLDERS

Past and current authorisation process refers to relevant results of past and current authorisation and oversight activities.

AMC1 ARO.GEN.305(e) Oversight programme

ED Decision 2014/025/R

PERSONS HOLDING A LICENCE, CERTIFICATE, RATING OR ATTESTATION

The oversight of persons holding a licence, certificate, rating or attestation should normally be ensured as part of the oversight of organisations. Additionally, the competent authority should verify compliance with applicable requirements when endorsing or renewing ratings.

To properly discharge its oversight responsibilities, the competent authority should perform a certain number of unannounced verifications.

ARO.GEN.310 Initial certification procedure – organisations

Regulation (EU) No 965/2012

- (a) Upon receiving an application for the initial issue of a certificate for an organisation, the competent authority shall verify the organisation's compliance with the applicable requirements. This verification may take into account the statement referred to in [ORO.AOC.100\(b\)](#).
- (b) When satisfied that the organisation is in compliance with the applicable requirements, the competent authority shall issue the certificate(s), as established in Appendices I and II. The certificate(s) shall be issued for an unlimited duration. The privileges and scope of the activities that the organisation is approved to conduct shall be specified in the terms of approval attached to the certificate(s).
- (c) To enable an organisation to implement changes without prior competent authority approval in accordance with [ORO.GEN.130](#), the competent authority shall approve the procedure submitted by the organisation defining the scope of such changes and describing how such changes will be managed and notified.

AMC1 ARO.GEN.310(a) Initial certification procedure – organisations

ED Decision 2017/006/R

VERIFICATION OF COMPLIANCE

- (a) Upon receipt of an application for an air operator certificate (AOC), the competent authority should:

- (1) assess the management system and processes, including the operator's organisation and operational control system;
 - (2) review the operations manual and any other documentation provided by the organisation; and
 - (3) for the purpose of verifying the organisation's compliance with the applicable requirements, conduct an audit at the organisation's facilities. The competent authority should require the conduct of one or more demonstration flights operated as if they were commercial flights, or an in-flight inspection should be conducted at the earliest opportunity.
- (b) The competent authority should ensure that the following steps are taken:
- (1) The organisation's written application for an AOC should be submitted at least 90 days before the date of intended operation, except that the operations manual may be submitted later, but not less than 60 days before the date of intended operation. The application form should be printed in language(s) of the competent authority's choosing.
 - (2) An individual should be nominated by the responsible person of the competent authority to oversee, to become the focal point for all aspects of the organisation certification process and to coordinate all necessary activity. The nominated person should be responsible to the responsible person of the competent authority for confirming that all appropriate audits and inspections have been carried out. He/she should also ensure that the necessary specific or prior approvals required by (b)(3) are issued in due course. Of particular importance on initial application is a careful review of the qualifications of the organisations' nominated persons. Account should be taken of the relevance of the nominee's previous experience and known record.
 - (3) Submissions that require the competent authority's specific or prior approval should be referred to the appropriate department of the competent authority. Submissions should include, where relevant, the associated qualification requirements and training programmes.
- (c) The ability of the applicant to secure, in compliance with the applicable requirements and the safe operation of aircraft, all necessary training and, where required, licensing of personnel, should be assessed. This assessment should also include the areas of responsibility and the numbers of those allocated by the applicant to key management tasks.
- (d) In order to verify the organisation's compliance with the applicable requirements, the competent authority should conduct an audit of the organisation, including interviews of personnel and inspections carried out at the organisation's facilities.
- The competent authority should only conduct such an audit after being satisfied that the application shows compliance with the applicable requirements.
- (e) The audit should focus on the following areas:
- (1) detailed management structure, including names and qualifications of personnel required by [ORO.GEN.210](#) and adequacy of the organisation and management structure;
 - (2) personnel:
 - (i) adequacy of number and qualifications with regard to the intended terms of approval and associated privileges;
 - (ii) validity of licences, ratings, certificates or attestations as applicable;

- (3) processes for safety risk management and compliance monitoring;
 - (4) facilities — adequacy with regard to the organisation's scope of work;
 - (5) documentation based on which the certificate should be granted (organisation documentation as required by Part-ORO, including technical manuals, such as operations manual or training manual).
- (f) In case of non-compliance, the applicant should be informed in writing of the corrections that are required.
- (g) When the verification process is complete, the person with overall responsibility, nominated in accordance with (b)(2), should present the application to the person responsible for the issue of an AOC together with a written recommendation and evidence of the result of all investigations or assessments which are required before the operator certificate is issued. Approvals required should be attached to the recommendation. The competent authority should inform the applicant of its decision concerning the application within 60 days of receipt of all supporting documentation. In cases where an application for an organisation certificate is refused, the applicant should be informed of the right of appeal as exists under national law.

ARO.GEN.330 Changes — organisations

Regulation (EU) No 965/2012

- (a) Upon receiving an application for a change that requires prior approval, the competent authority shall verify the organisation's compliance with the applicable requirements before issuing the approval.
- The competent authority shall prescribe the conditions under which the organisation may operate during the change, unless the competent authority determines that the organisation's certificate needs to be suspended.
- When satisfied that the organisation is in compliance with the applicable requirements, the competent authority shall approve the change.
- (b) Without prejudice to any additional enforcement measures, when the organisation implements changes requiring prior approval without having received competent authority approval as defined in (a), the competent authority shall suspend, limit or revoke the organisation's certificate.
- (c) For changes not requiring prior approval, the competent authority shall assess the information provided in the notification sent by the organisation in accordance with [ORO.GEN.130](#) to verify compliance with the applicable requirements. In case of any non-compliance, the competent authority shall:
- (1) notify the organisation about the non-compliance and request further changes;
 - (2) in case of level 1 or level 2 findings, act in accordance with [ARO.GEN.350](#).

AMC1 ARO.GEN.330 Changes – organisations

ED Decision 2019/019/R

AOC HOLDERS

- (a) Changes to personnel specified in Part-ORO:
- (1) Any changes to the accountable manager specified in [ORO.GEN.210\(a\)](#) that affect the certificate or terms of approval/approval schedule attached to it, require prior approval under [ARO.GEN.330\(a\)](#) and [ORO.GEN.130\(a\) and \(b\)](#).
 - (2) When an organisation submits the name of a new nominee for any of the persons nominated as per [ORO.GEN.210\(b\)](#) or for a safety manager as defined under [AMC1 ORO.GEN.200\(a\)\(1\)](#), the competent authority should require the organisation to produce a written résumé of the proposed person's qualifications. The competent authority should reserve the right to interview the nominee or call for additional evidence of his or her suitability before deciding upon his or her acceptability.
- (b) A simple management system documentation status sheet should be maintained, which contains information on when an amendment was received by the competent authority and when it was approved.
- (c) The organisation should provide each management system documentation amendment to the competent authority, including for the amendments that do not require prior approval by the competent authority. Where the amendment requires competent authority approval, the competent authority, when satisfied, should indicate its approval in writing. Where the amendment does not require prior approval, the competent authority should acknowledge receipt in writing within 10 working days.
- (d) For changes requiring prior approval, in order to verify the organisation's compliance with the applicable requirements, the competent authority should conduct an audit of the organisation, limited to the extent of the changes. If required for verification, the audit should include interviews and inspections carried out at the organisation's facilities.

GM1 ARO.GEN.330 Changes – organisations

ED Decision 2014/025/R

CHANGE OF NAME OF THE ORGANISATION

- (a) On receipt of the application and the relevant parts of the organisation's documentation as required by Part-ORO, the competent authority should re-issue the certificate.
- (b) A name change alone does not require the competent authority to audit the organisation, unless there is evidence that other aspects of the organisation have changed.

ARO.GEN.345 Declaration – organisations

Regulation (EU) 2018/1975

- (a) Upon receiving a declaration from an organisation carrying out or intending to carry out activities for which a declaration is required, the competent authority shall verify that the declaration contains all the information required:
- (1) pursuant to [ORO.DEC.100](#) of Annex III (Part-ORO) to this Regulation; or
 - (2) for balloon operators pursuant to BOP.ADD.100 of Annex II (Part-BOP) to Regulation (EU) 2018/395; or

- (3) for sailplane operators pursuant to SAO.DEC.100 of Annex II (Part-SAO) to Implementing Regulation (EU) 2018/1976.

After having verified the required information, the competent authority shall acknowledge receipt of the declaration to the organisation.

- (b) If the declaration does not contain the required information, or contains information that indicates non-compliance with applicable requirements, the competent authority shall notify the organisation about the non-compliance and request further information. If deemed necessary the competent authority shall carry out an inspection of the organisation. If the non-compliance is confirmed, the competent authority shall take action as defined in [ARO.GEN.350](#).

AMC1 ARO.GEN.345 Declaration – organisations

ED Decision 2014/025/R

ACKNOWLEDGEMENT OF RECEIPT

The competent authority should acknowledge receipt of the declaration in writing within 10 working days.

GM1 ARO.GEN.345 Declaration – organisations

ED Decision 2014/025/R

VERIFICATION — DECLARATION

The verification made by the competent authority upon receipt of a declaration does not imply an inspection. The aim is to check whether what is declared complies with applicable regulations.

ARO.GEN.350 Findings and corrective actions – organisations

Regulation (EU) 2019/1384

- (a) The competent authority for oversight in accordance with [ARO.GEN.300\(a\)](#) shall have a system to analyse findings for their safety significance.
- (b) A level 1 finding shall be issued by the competent authority when any significant non-compliance is detected with the applicable requirements of Regulation (EC) No 216/2008 and its Implementing Rules, with the organisation's procedures and manuals or with the terms of an approval, certificate, specialised operation authorisation or with the content of a declaration which lowers safety or seriously hazards flight safety.

The level 1 findings shall include:

- (1) failure to give the competent authority access to the facilities of the organisation in accordance with point [ORO.GEN.140](#) of Annex III (Part-ORO) to this Regulation, or for balloons operators in accordance with points BOP.ADD.015 and BOP.ADD.035 of Annex II (Part-BOP) to Regulation (EU) 2018/395, during normal operating hours and after two written requests;
- (2) obtaining or maintaining the validity of the organisation certificate or specialised operations authorisation by falsification of submitted documentary evidence;
- (3) evidence of malpractice or fraudulent use of the organisation certificate or specialised operations authorisation; and
- (4) the lack of an accountable manager.

- (c) A level 2 finding shall be issued by the competent authority when any non-compliance is detected with the applicable requirements of Regulation (EC) No 216/2008 and its Implementing Rules, with the organisation's procedures and manuals or with the terms of an approval, certificate, specialised operation authorisation or with the content of a declaration which could lower safety or hazard flight safety.
- (d) When a finding is detected during oversight or by any other means, the competent authority shall, without prejudice to any additional action required by Regulation (EC) No 216/2008 and its Implementing Rules, communicate the finding to the organisation in writing and request corrective action to address the non-compliance(s) identified. Where relevant, the competent authority shall inform the State in which the aircraft is registered.
- (1) In the case of level 1 findings the competent authority shall take immediate and appropriate action to prohibit or limit activities, and if appropriate, it shall take action to revoke the certificate, specialised operations authorisation or specific approval or to limit or suspend it in whole or in part, depending upon the extent of the level 1 finding, until successful corrective action has been taken by the organisation.
- (2) In the case of level 2 findings, the competent authority shall:
- (i) grant the organisation a corrective action implementation period appropriate to the nature of the finding that in any case initially shall not be more than three months. At the end of this period, and subject to the nature of the finding, the competent authority may extend the three-month period subject to a satisfactory corrective action plan agreed by the competent authority; and
- (ii) assess the corrective action and implementation plan proposed by the organisation and, if the assessment concludes that they are sufficient to address the non-compliance(s), accept these.
- (3) Where an organisation fails to submit an acceptable corrective action plan, or to perform the corrective action within the time period accepted or extended by the competent authority, the finding shall be raised to a level 1 finding and action taken as laid down in (d)(1).
- (4) The competent authority shall record all findings it has raised or that have been communicated to it in accordance with point (e) and, where applicable, the enforcement measures it has applied, as well as all corrective actions and date of action closure for findings.
- (e) Without prejudice to any additional enforcement measures, when the authority of a Member State acting under the provisions of [ARO.GEN.300\(d\)](#) identifies any non-compliance with the applicable requirements of Regulation (EC) No 216/2008 and its Implementing Rules by an organisation certified by, or authorised by or declaring its activity to the competent authority of another Member State or the Agency, it shall inform that competent authority and provide an indication of the level of finding.

GM1 ARO.GEN.350 Findings and corrective actions – organisations

ED Decision 2014/025/R

TRAINING

For a level 1 finding it may be necessary for the competent authority to ensure that further training by the organisation is carried out and audited by the competent authority before the activity is resumed, dependent upon the nature of the finding.

GM2 ARO.GEN.350(d) Findings and corrective actions – organisations

ED Decision 2017/006/R

CORRECTIVE ACTION IMPLEMENTATION PERIOD

The 3-month period should commence from the date of the communication of the finding to the organisation in writing and requesting corrective action to address the non-compliance(s) identified.

ARO.GEN.355 Findings and enforcement measures – persons

Regulation (EU) No 379/2014

- (a) If, during oversight or by any other means, evidence is found by the competent authority responsible for oversight in accordance with [ARO.GEN.300\(a\)](#) that shows a non-compliance with the applicable requirements by a person holding a licence, certificate, rating or attestation issued in accordance with Regulation (EC) No 216/2008 and its Implementing Rules, the competent authority shall act in accordance with ARA.GEN.355(a) to (d) of Annex VI (Part-ARA) to Commission Regulation (EU) No 1178/2011¹.
- (b) If, during oversight or by any other means, evidence is found showing a non-compliance with the applicable requirements by a person subject to the requirements laid down in Regulation (EC) No 216/2008 and its Implementing Rules and not holding a licence, certificate, rating or attestation issued in accordance with that Regulation and its Implementing Rules, the competent authority that identified the non-compliance shall take any enforcement measures necessary to prevent the continuation of that non-compliance.

GM1 ARO.GEN.355(b) Findings and enforcement measures – persons

ED Decision 2014/025/R

GENERAL

This provision is necessary to ensure that enforcement measures will be taken also in cases where the competent authority may not act on the licence, certificate or attestation. The type of enforcement measure will depend on the applicable national law and may include for example the payment of a fine or the prohibition from exercising.

It covers two cases:

- (a) persons subject to the requirements laid down in Regulation (EC) No 216/2008 and its Implementing Rules who are not required to hold a licence, certificate or attestation; and
- (b) persons who are required to hold a licence, rating, certificate or attestation, but who do not hold the appropriate licence, rating, certificate or attestation as required for the activity they perform.

ARO.GEN.360 Findings and enforcement measures – all operators

Regulation (EU) No 379/2014

If, during oversight or by any other means, evidence is found showing a non-compliance with the applicable requirements by an operator subject to the requirements laid down in Regulation (EC)

¹ OJ L 100, 5.4.2012, p. 1.

No 216/2008 and its Implementing Rules, the competent authority that identified the non-compliance shall take any enforcement measures necessary to prevent the continuation of that non-compliance.

SUBPART OPS: AIR OPERATIONS

SECTION I – CERTIFICATION OF COMMERCIAL AIR TRANSPORT OPERATORS

ARO.OPS.100 Issue of the air operator certificate

Regulation (EU) No 379/2014

- (a) The competent authority shall issue the air operator certificate (AOC) when satisfied that the operator has demonstrated compliance with the elements required in [ORO.AOC.100](#).
- (b) The certificate shall include the associated operations specifications.
- (c) The competent authority may determine specific operational limitations. Such limitations shall be documented in the operations specifications.

GM1 ARO.OPS.100(b) Issue of the air operator certificate

ED Decision 2017/006/R

AREA OF OPERATION

- (a) If the area of operation within the operational specifications of [Appendix II](#) to Part-ARO is not defined as 'worldwide' or 'with no geographical limit', the competent authority should describe the boundaries of a permissible area of operation by listing for example:
 - (1) a continuous line between a list of coordinates (Lat./Long.);
 - (2) the national boundary of the State of issuance of the AOC;
 - (3) a flight information region (FIR) boundary;
 - (4) a combination of adjacent FIR boundaries;
 - (5) ICAO region(s) as per ICAO Doc 7030; and
 - (6) operations in the Inter-Tropical Convergence Zone (ICTZ).
- (b) The following factors should be taken into account when deciding the area of operation for CAT operations:
 - (1) The adequacy of the operational control and maintenance arrangements within the proposed area of operation.
 - (2) The general suitability of the aircraft which are to be used and in particular:
 - (i) the performance capability of the aircraft with regard to the terrain;
 - (ii) the need for any special equipment;
 - (iii) the aircraft systems and the level of redundancy of those systems, with regard to extremes of weather or climate; and
 - (iv) the need for any special dispatch minima with regard to the content of the MEL.
 - (3) Any special training required for:
 - (i) weather or climatic conditions likely to be encountered; and
 - (ii) compliance with specific approvals under Part-SPA (MNPS, RVSM, etc.).

- (4) The need for the flight crew to comply with non-standard ATC requirements such as the use of:
 - (i) non-standard phraseology;
 - (ii) altitude clearances in metres; and
 - (iii) altimeter settings in inches of mercury, wind speed in metres/sec, visibility in miles, etc.
- (5) The navigation and communication facilities available over the routes proposed and the associated equipment of the aircraft.
- (6) The adequacy of aerodromes or operating sites available within the proposed area, and the availability of current maps, charts, associated documents or equivalent data.
- (7) The availability of adequate search and rescue facilities, and the need to carry special survival equipment and the need for training in the use of the survival equipment.
- (8) Survival equipment available for the operator and installed in the aircraft used.

ARO.OPS.105 Code-share arrangements

Regulation (EU) No 965/2012

In considering the safety of a code-share agreement involving a third-country operator, the competent authority shall:

- (1) satisfy itself, following the verification by the operator as set out in [ORO.AOC.115](#), that the third-country operator complies with the applicable ICAO standards;
- (2) liaise with the competent authority of the State of the third-country operator as necessary.

AMC1 ARO.OPS.105 Code-share arrangements

ED Decision 2014/025/R

SAFETY OF A CODE-SHARE AGREEMENT

- (a) When evaluating the safety of a code-share agreement, the competent authority should check that the:
 - (1) documented information provided by the applicant in accordance with [ORO.AOC.115](#) is complete and shows compliance with the applicable ICAO standards; and
 - (2) operator has established a code-share audit programme for monitoring continuous compliance of the third country operator with the applicable ICAO standards.
- (b) The competent authority should request the applicant to make a declaration covering the above items.
- (c) In case of non-compliance, the applicant should be informed in writing of the corrections which are required.

AMC2 ARO.OPS.105 Code-share arrangements

ED Decision 2014/025/R

AUDITS PERFORMED BY A THIRD PARTY PROVIDER

When audits are performed by a third party provider, the competent authority should verify if the third party provider meets the criteria established in [AMC2 ORO.AOC.115\(b\)](#).

ARO.OPS.110 Lease agreements for aeroplanes and helicopters

Regulation (EU) 2019/138484

- (a) The competent authority shall approve a lease agreement when satisfied that the operator certified in accordance with Annex III (Part-ORO) complies with:
- (1) [ORO.AOC.110\(d\)](#), for dry leased-in third country aircraft;
 - (2) [ORO.AOC.110\(c\)](#), for wet lease-in of an aircraft from a third country operator;
 - (3) [ORO.AOC.110\(e\)](#), for dry lease-out of an aircraft to any operator, except for the cases specified in point ORO.GEN.310 of Annex III;
 - (4) relevant requirements of continuing airworthiness and air operations, for dry lease-in of an aircraft registered in the EU and wet lease-in of an aircraft from an EU operator.
- (b) The approval of a wet lease-in agreement shall be suspended or revoked whenever:
- (1) the AOC of the lessor or lessee is suspended or revoked;
 - (2) the lessor is subject to an operating ban pursuant to Regulation (EC) No 2111/2005¹ of the European Parliament and of the Council²;
 - (3) the authorisation issued in accordance with Commission Regulation (EU) No 452/2014³ has been suspended, revoked or surrendered.
- (c) The approval of a dry lease-in agreement shall be suspended or revoked whenever:
- (1) the certificate of airworthiness of the aircraft is suspended or revoked;
 - (2) the aircraft is included in the list of operators subject to operational restrictions or it is registered in a State of which all operators under its oversight are subject to an operating ban pursuant to Regulation (EC) No 2111/2005.
- (d) When asked for the prior approval of a dry-lease out agreement in accordance with [ORO.AOC.110\(e\)](#), the competent authority shall ensure:
- (1) proper coordination with the competent authority responsible for the continuing oversight of the aircraft, in accordance with Commission Regulation (EU) No 1321/2014⁴, or for the operation of the aircraft, if it is not the same authority;
 - (2) that the aircraft is timely removed from the operator's AOC except for the cases specified in point [ORO.GEN.310](#) of Annex III.
- (e) When asked for prior approval of a dry lease-in agreement in accordance with point [ORO.AOC.110\(d\)](#), the competent authority shall ensure proper coordination with the State of Registry of the aircraft as necessary to exercise the oversight responsibilities of the aircraft.

¹ Regulation (EC) No 2111/2005 of the European Parliament and of the Council of 14 December 2005 on the establishment of a Community list of air carriers subject to an operating ban within the Community and on informing air transport passengers of the identity of the operating air carrier, and repealing Article 9 of Directive 2004/36/EC (OJ L 344, 27.12.2005, p. 15).

³ Commission Regulation (EU) No 452/2014 of 29 April 2014 laying down technical requirements and administrative procedures related to air operations of third country operators pursuant to Regulation (EC) No 216/2008 of the European Parliament and of the Council (OJ L 133, 6.5.2014, p. 12).

⁴ Commission Regulation (EU) No 1321/2014 of 26 November 2014 on the continuing airworthiness of aircraft and aeronautical products, parts and appliances, and on the approval of organisations and personnel involved in these tasks (OJ L 362, 17.12.2014, p. 1).

AMC1 ARO.OPS.110 Lease agreements for aeroplanes and helicopters

ED Decision 2018/003/R

WET LEASE-IN

- (a) Before approving a wet lease-in agreement, the competent authority of the lessee should assess available reports on ramp inspections performed on aircraft of the lessor.
- (b) The competent authority should only approve a wet lease-in agreement if the routes intended to be flown are contained within the authorised areas of operations specified in the AOC of the lessor.

AMC2 ARO.OPS.110 Lease agreements for aeroplanes and helicopters

ED Decision 2018/003/R

SHORT TERM WET LEASE-IN

The competent authority of the lessee may approve third country operators individually or a framework contract with more than one third country operator in anticipation of operational needs or to overcome operational difficulties taking into account the conditions defined in Article 13(3) of Regulation (EC) No 1008/2008.

GM1 ARO.OPS.110 Lease agreements for aeroplanes and helicopters

ED Decision 2018/003/R

APPROVAL

- (a) Except for wet lease-out, approval for an EU operator to lease an aircraft of another operator should be issued by the competent authority of the lessee and the competent authority of the lessor.
- (b) When an EU operator leases an aircraft of an undertaking or person other than an operator, the competent authority of the lessee should issue the approval.

GM2 ARO.OPS.110 Lease agreements for aeroplanes and helicopters

ED Decision 2019/019/R

DRY LEASE-OUT

The purpose of the requirement for the competent authority to ensure proper coordination with the authority that is responsible for the oversight of the continuing airworthiness of the aircraft in accordance with Commission Regulation (EU) No 1321/2014¹ is to ensure that appropriate arrangements are in place to allow:

- (a) the transfer of regulatory oversight over the aircraft, if relevant; or
- (b) continued compliance of the aircraft with the requirements of Commission Regulation (EU) No 1321/2014.

¹ OJ L 362, 17.12.2014, p.1.

ED Decision 2019/019/R

LONG-TERM WET LEASE-IN AGREEMENTS BETWEEN OPERATORS REGISTERED IN DIFFERENT EU MEMBER STATES

In case of a long-term wet lease-in agreement between operators having their principal place of business in different EU Member States, the competent authorities of the lessee and the competent authority of the lessor may consider a mutual exchange of all necessary information in accordance with [ARO.GEN.200\(c\)](#).

SECTION IA – AUTHORISATION OF HIGH RISK COMMERCIAL SPECIALISED OPERATIONS

ARO.OPS.150 Authorisation of high risk commercial specialised operations

Regulation (EU) 2019/1384

- (a) Upon receiving an application for the issue of a high risk commercial specialised operations authorisation, the competent authority of the operator shall review the operator's risk assessment documentation and standard operating procedures (SOP), related to one or more planned operations and developed in accordance with the relevant requirements of Annex VIII (Part-SPO).
- (b) When satisfied with the risk assessment and SOP, the competent authority of the operator shall issue the authorisation, as established in [Appendix IV](#). The authorisation may be issued for a limited or for unlimited duration. The conditions under which an operator is authorised to conduct one or more high risk commercial specialised operations shall be specified in the authorisation.
- (c) Upon receiving an application for a change to the authorisation, the competent authority of the operator shall comply with (a) and (b). It shall prescribe the conditions under which the operator may operate during the change, unless the competent authority determines that the authorisation needs to be suspended.
- (d) Upon receiving an application for the renewal of the authorisation, the competent authority of the operator shall comply with (a) and (b). It may take into account the past authorisation process and oversight activities.
- (e) Without prejudice to any additional enforcement measures, when the operator implements changes without having submitted an amended risk assessment and SOP, the competent authority of the operator shall suspend, limit or revoke the authorisation.
- (f) Upon receiving an application for the issue of an authorisation for a cross-border high risk commercial specialised operation, the competent authority of the operator shall review the operator's risk assessment documentation and standard operating procedures (SOP) in coordination with the competent authority of the place where the operation is planned to be conducted. When both authorities are satisfied with the risk assessment and SOP, the competent authority of the operator shall issue the authorisation.

AMC1 ARO.OPS.150 Authorisation of high risk commercial specialised operations

ED Decision 2014/025/R

GENERAL

The competent authority should make publicly available a list of activities of high risk commercial specialised operations so that operators are informed when to apply for an authorisation.

AMC1 ARO.OPS.150(a);(b) Authorisation of high risk commercial specialised operations

ED Decision 2014/025/R

VERIFICATION OF COMPLIANCE

- (a) For the purpose of verifying the operator's standard operating procedures (SOPs), the competent authority may conduct an audit at the operator's facilities or require the conduct of one or more demonstration flights operated as if they were high risk commercial specialised operations.
- (b) An individual should be nominated by the competent authority to become the focal point for all aspects of the authorisation process and to coordinate all necessary activity. This nominated person should confirm to the responsible person of the competent authority issuing the authorisation that all appropriate audits and inspections have been carried out.
- (c) When the verification process is complete, the person, nominated in accordance with (b), should present the application to the person responsible for the issuance of an authorisation together with a written recommendation and evidence of the result of the review of the operator's risk assessment documentation and SOPs, which is required before the authorisation is issued. The competent authority should inform the applicant of its decision concerning the application. In cases where an application for an authorisation is refused, the applicant should be informed of the right of appeal as exists under national law.

GM1 ARO.OPS.150(b) Authorisation of high risk commercial specialised operations

ED Decision 2014/025/R

LIMITATIONS

The competent authority may issue the authorisation for a limited duration, e.g. for a single event or a defined series of flights, or limit the operating area.

GM1 ARO.OPS.150(c) Authorisation of high risk commercial specialised operations

ED Decision 2014/025/R

CHANGE OF NAME OF THE ORGANISATION

- (a) Upon receipt of the application for a change of the authorisation, the competent authority should re-issue the authorisation.
- (b) A name change alone does not require the competent authority to re-assess the risk assessment and SOPs, unless there is evidence that other aspects of the operation have changed.

AMC1 ARO.OPS.150(f) Authorisation of high risk commercial specialised operations

ED Decision 2014/025/R

AUTHORISATION OF CROSS-BORDER HIGH RISK COMMERCIAL SPECIALISED OPERATION

- (a) An authorisation for cross-border high risk commercial specialised operations should be issued by the competent authority, when both the competent authority itself and the competent authority of the place where the operation is planned to be conducted are satisfied that the risk assessment and SOPs are appropriate for the area overflown.
- (b) The authorisation should be amended to include those areas for which the operator has received the authorisation to conduct cross-border high risk commercial specialised operation.

GM1 ARO.OPS.150(f) Authorisation of high risk commercial specialised operations

ED Decision 2014/025/R

AUTHORISATION OF CROSS-BORDER HIGH RISK COMMERCIAL SPECIALISED OPERATION

Cross-border high risk commercial specialised operation means a high risk commercial specialised operation in a territory other than the Member State than where the operator has its principle place of business.

ARO.OPS.155 Lease agreements

Regulation (EU) No 379/2014

- (a) The competent authority shall approve a lease agreement involving a third country registered aircraft or a third country operator when the SPO operator has demonstrated compliance with [ORO.SPO.100](#).
- (b) The approval of a dry lease-in agreement shall be suspended or revoked whenever the certificate of airworthiness of the aircraft is suspended or revoked.

GM1 ARO.OPS.155 Lease agreements

ED Decision 2014/025/R

WET LEASE-IN

Since ICAO has not stipulated globally harmonised standards for specialised operators and their operation, the applicable requirements involving a third country registered aircraft of a third country operator will be of a local or national nature. Therefore, the competent authority approving a wet lease-in agreement is encouraged to collect information on the oversight system of the state of the operator or state of registry, if applicable, in order to have a better understanding of the operation.

GM2 ARO.OPS.155 Lease agreements

ED Decision 2014/025/R

LEASE AGREEMENTS BETWEEN OPERATORS REGISTERED IN AN EU MEMBER STATE

No approval is required for any lease agreements between operators having their principle place of business in an EU Member State.

SECTION II – APPROVALS

ARO.OPS.200 Specific approval procedure

Regulation (EU) 2019/1384

- (a) Upon receiving an application for the issue of a specific approval or changes thereof, the competent authority shall assess the application in accordance with the relevant requirements of Annex V (Part-SPA) and conduct, where relevant, an appropriate inspection of the operator.
- (b) When satisfied that the operator has demonstrated compliance with the applicable requirements, the competent authority shall issue or amend the approval. The approval shall be specified in:
 - (1) the operations specifications, as established in [Appendix II](#), for commercial air transport operations; or
 - (2) the list of specific approvals, as established in [Appendix III](#), for non-commercial operations and specialised operations.

AMC1 ARO.OPS.200 Specific approval procedure

ED Decision 2014/025/R

PROCEDURES FOR THE APPROVAL OF CARRIAGE OF DANGEROUS GOODS

When verifying compliance with the applicable requirements of [SPA.DG.100](#), the competent authority should check that:

- (a) the procedures specified in the operations manual are sufficient for the safe transport of dangerous goods;
- (b) operations personnel are properly trained in accordance with the ICAO Technical Instructions for the *Safe Transport of Dangerous Goods by Air* (ICAO Doc 9284-AN/905); and
- (c) a reporting scheme is in place.

AMC2 ARO.OPS.200 SPECIFIC APPROVAL PROCEDURE

ED Decision 2014/025/R

PROCEDURES FOR THE APPROVAL FOR REDUCED VERTICAL SEPARATION MINIMA (RVSM) OPERATIONS

- (a) When verifying compliance with the applicable requirements of Subpart D of Annex V (SPA.RVSM), the competent authority should verify that:
 - (1) each aircraft holds an adequate RVSM airworthiness approval;
 - (2) procedures for monitoring and reporting height keeping errors have been established;
 - (3) a training programme for the flight crew involved in these operations has been established; and
 - (4) operating procedures have been established.
- (b) Demonstration flight(s)

The content of the RVSM application may be sufficient to verify the aircraft performance and procedures. However, the final step of the approval process may require a demonstration flight. The competent authority may appoint an inspector for a flight in RVSM airspace to verify that

all relevant procedures are applied effectively. If the performance is satisfactory, operation in RVSM airspace may be permitted.

(c) Form of approval documents

Each aircraft group for which the operator is granted approval should be listed in the approval.

(d) Airspace monitoring

For airspace, where a numerical target level of safety is prescribed, monitoring of aircraft height keeping performance in the airspace by an independent height monitoring system is necessary to verify that the prescribed level of safety is being achieved. However, an independent monitoring check of an aircraft is not a prerequisite for the grant of an RVSM approval.

(1) Suspension, revocation and reinstatement of RVSM approval

The incidence of height keeping errors that can be tolerated in an RVSM environment is small. It is expected of each operator to take immediate action to rectify the conditions that cause an error. The operator should report an occurrence involving poor height keeping to the competent authority within 72 hours. The report should include an initial analysis of causal factors and measures taken to prevent repeat occurrences. The need for follow-up reports should be determined by the competent authority. Occurrences that should be reported and investigated are errors of:

- (i) total vertical error (TVE) equal to or greater than ± 90 m (± 300 ft);
- (ii) altimeter system error (ASE) equal to or greater than ± 75 m (± 245 ft); and
- (iii) assigned altitude deviation equal to or greater than ± 90 m (± 300 ft).

Height keeping errors fall into two broad categories:

- errors caused by malfunction of aircraft equipment; and
- operational errors.

(2) An operator that consistently experiences errors in either category should have approval for RVSM operations suspended or revoked. If a problem is identified that is related to one specific aircraft type, then RVSM approval may be suspended or revoked for that specific type within that operator's fleet.

(3) Operators' actions:

The operator should make an effective, timely response to each height keeping error. The competent authority may consider suspending or revoking RVSM approval if the operator's responses to height keeping errors are not effective or timely. The competent authority should consider the operator's past performance record in determining the action to be taken.

(4) Reinstatement of approval:

The operator should satisfy the competent authority that the causes of height keeping errors are understood and have been eliminated and that the operator's RVSM programmes and procedures are effective. At its discretion and to restore confidence, the competent authority may require an independent height monitoring check of affected aircraft to be performed.

AMC3 ARO.OPS.200 Specific approval procedure

ED Decision 2016/022/R

APPROVAL OF HELICOPTER OFFSHORE OPERATIONS

(a) Approval

When verifying compliance with the applicable requirements of Subpart K of Annex V (Part-SPA) to Regulation (EU) No 965/2012, the competent authority should ensure prior to issuing an approval that:

- (1) the hazard identification, risk assessment and risk mitigation processes are in place;
- (2) operating procedures have been established applicable to the area of operation;
- (3) helicopters are appropriately certified and equipped for the area of operation;
- (4) flight crew involved in these operations are trained and checked in accordance with the training and checking programmes established by the operator; and
- (5) all requirements of Part-SPA, Subpart K are met.

(b) Demonstration flight(s)

The final step of the approval process may require a demonstration flight performed in the area of operation. The competent authority may appoint an inspector for a flight to verify that all relevant procedures are applied effectively. If the performance is satisfactory, helicopter offshore operations may be approved.

AMC4 ARO.OPS.200 Specific approval procedure

ED Decision 2017/004/R

PROCEDURES FOR THE APPROVAL OF COMMERCIAL AIR TRANSPORT OPERATIONS WITH SINGLE-ENGINE TURBINE AEROPLANES AT NIGHT OR IN INSTRUMENT METEOROLOGICAL CONDITIONS (SET-IMC)

(a) When verifying compliance with the applicable requirements of Subpart L (SET-IMC) of Annex V (Part-SPA) to Regulation (EU) No 965/2012, the competent authority should check that:

- (1) the aeroplane is eligible for SET-IMC operations;
- (2) the maintenance and operational procedures are adequate;
- (3) a training programme for the flight crew involved in these operations has been established; and
- (4) the operator has adequately assessed the risks of the intended operations.

In particular, the competent authority should assess the operator's safety performance, experience and flight crew training, as reflected in the data provided by the operator with its application, to ensure that the intended safety level is achieved.

With regard to the operator's specific SET-IMC flight crew training, the competent authority should ensure that it complies with the applicable requirements of Subpart FC (FLIGHT CREW) of Annex III (Part-ORO) and Subpart L (SET-IMC) of Annex V (Part-SPA) to Regulation (EU) No 965/2012, and that it is appropriate to the operations envisaged.

The competent authority should assess the operator's ability to achieve and maintain an acceptable level of power plant reliability by reviewing its engine-trend-monitoring programme and propulsion reliability programme, which are established in accordance with Annex I (Part-M) to Regulation (EU) No 1321/2014.

- (b) The competent authority may impose temporary restrictions to the operations (e.g. limitation to specific routes) until the operator is able to demonstrate that it has the capability to operate safely in compliance with all the applicable requirements.
- (c) When issuing the approval, the competent authority should specify:
 - (1) the particular engine-airframe combination;
 - (2) the identification by registration of the individual aeroplanes designated for single-engined turbine aeroplane operations at night and/or in IMC; and
 - (3) the authorised areas and/or routes of operation.

VALIDATION OF OPERATIONAL CAPABILITY

Observation by the competent authority of a validation flight, simulating the proposed operation in the aeroplane, should be carried out before an approval is granted. This should include flight planning and preflight procedures, as well as a demonstration of the following simulated emergency procedures in simulated IMC/night:

- (a) total failure of the propulsion system; and
- (b) total loss of normally generated electrical power.

In order to mitigate the risks associated with the conduct of such emergency procedures, the following should be ensured:

- (a) in case of planned single-pilot operations, the crew should be composed of the commander using view-limiting devices for the purpose of simulating IMC/night and a second rated pilot whose responsibility is to help maintain visual separation from other aircraft, clouds, and terrain;
- (b) the flight should be conducted in visual meteorological conditions (VMC) by day, and additional, more restrictive weather minima may be established for the demonstration of the procedures involving higher risks; and
- (c) touch drills should be used when simulating a total failure of the propulsion system.

AMC5 ARO.OPS.200 Specific approval procedure

ED Decision 2022/012/R

PROCEDURES FOR THE APPROVAL OF LOW-VISIBILITY OPERATIONS

Before issuing an approval for low-visibility operations (LVOs), the competent authority should verify that the applicant has:

- (a) taken account of the relevant airworthiness requirements and limitations;
- (b) established the relevant aerodrome operating minima;
- (c) established and documented the relevant operating procedures;
- (d) established and conducted adequate training and checking programmes;
- (e) adopted the minimum equipment list (MEL) for the LVOs to be undertaken;
- (f) processes to ensure that only runways and instrument procedures suitable for the intended operations are used; and
- (g) established and conducted the relevant risk assessment and monitoring programmes.

GM1 ARO.OPS.200 Specific approval procedure

ED Decision 2016/022/R

LIMITATIONS FOR HELICOPTER OFFSHORE OPERATIONS

The competent authority may impose limitations related to routes and areas of operation for offshore helicopter operations. Such limitations may be specified in the operations specifications (OPSSPEC) or specific approved documents or in the aeronautical information publication (AIP) or by other means.

For operations over sea areas, limitations may include a maximum significant wave height under which there is a good prospect of recovery of survivors. This should be linked with the available search and rescue capabilities in the different sea areas.

GM2 ARO.OPS.200 Specific approval procedure

ED Decision 2019/019/R

SPECIFIC APPROVALS FOR TRAINING ORGANISATIONS

The specific approvals, as established in [Appendix III](#), for non-commercial operations and specialised operations, also apply to training organisations with a principal place of business in a Member State.

GM3 ARO.OPS.200 Specific approval procedure

ED Decision 2019/019/R

INSERTION OF RELEVANT INFORMATION INTO THE OPERATIONS SPECIFICATIONS

When issuing the operations specifications in accordance with [Appendix II](#), where the operation does not include helicopter operations, the helicopter-related elements contained in the operations specifications may be omitted.

GM4 ARO.OPS.200 Specific approval procedure

ED Decision 2022/012/R

SPA.PinS-VFR APPROVAL PROCEDURE

When issuing an approval for helicopter PinS approaches and departures with reduced VFR minima, the competent authority may use the 'OTHERS' box of [Appendix II](#) (EASA Form 139).

ARO.OPS.205 Minimum equipment list approval

Regulation (EU) No 965/2012

- (a) When receiving an application for initial approval of a minimum equipment list (MEL) or an amendment thereof from an operator, the competent authority shall assess each item affected, to verify compliance with the applicable requirements, before issuing the approval.
- (b) The competent authority shall approve the operator's procedure for the extension of the applicable rectification intervals B, C and D, if the conditions specified in [ORO.MLR.105\(f\)](#) are demonstrated by the operator and verified by the competent authority.
- (c) The competent authority shall approve, on a case-by-case basis, the operation of an aircraft outside the constraints of the MEL but within the constraints of the master minimum equipment list (MMEL), if the conditions specified in [ORO.MLR.105](#) are demonstrated by the operator and verified by the competent authority.

GM1 ARO.OPS.205 Minimum equipment list approval

ED Decision 2014/025/R

EXTENSION OF RECTIFICATION INTERVALS

The competent authority should verify that the operator does not use the extension of rectification intervals as a means to reduce or eliminate the need to rectify MEL defects in accordance with the established category limit. The extension of rectification intervals should only be considered valid and justifiable when events beyond the operator's control have precluded rectification.

ARO.OPS.210 Determination of distance or local area

Regulation (EU) No 965/2012

The competent authority may determine a distance or local area for the purpose of operations.

GM1 ARO.OPS.210 Determination of local area

ED Decision 2014/025/R

GENERAL

The distance or local area should reflect the local environment and operating conditions.

ARO.OPS.215 Approval of helicopter operations over a hostile environment located outside a congested area

Regulation (EU) No 965/2012

- (a) The Member State shall designate those areas where helicopter operations may be conducted without an assured safe forced landing capability, as described in [CAT.POL.H.420](#).
- (b) Before issuing the approval referred to in [CAT.POL.H.420](#) the competent authority shall have considered the operator's substantiation precluding the use of the appropriate performance criteria.

AMC1 ARO.OPS.215 Approval of helicopter operations over a hostile environment located outside a congested area

ED Decision 2014/025/R

APPROVALS THAT REQUIRE ENDORSEMENT

- (a) Whenever the operator applies for an approval in accordance with [CAT.POL.H.420](#) for which an endorsement from another State is required, the competent authority should only grant the approval once endorsement of that other State has been received.
- (b) The Operations Specification should be amended to include those areas for which endorsement was received.

AMC2 ARO.OPS.215 Approval of helicopter operations over a hostile environment located outside a congested area

ED Decision 2014/025/R

ENDORSEMENT BY ANOTHER STATE

- (a) Whenever the operator applies for an endorsement to operate over hostile environment located outside a congested area in another State in accordance with [CAT.POL.H.420](#), the competent authority of that other State should only grant the endorsement once it is satisfied that:
 - (1) the safety risk assessment is appropriate to the area overflown; and
 - (2) the operator's substantiation that preclude the use of the appropriate performance criteria are appropriate for the area overflown.
- (b) The competent authority of that other State should inform the competent authority of the Member State responsible for issuing the approval.

ARO.OPS.220 Approval of helicopter operations to or from a public interest site

Regulation (EU) No 965/2012

The approval referred to in [CAT.POL.H.225](#) shall include a list of the public interest site(s) specified by the operator to which the approval applies.

AMC1 ARO.OPS.220 Approval of helicopter operations to or from a public interest site

ED Decision 2014/025/R

APPROVALS THAT REQUIRE ENDORSEMENT

Whenever the operator applies for an approval in accordance with [CAT.POL.H.225](#) to conduct operations to or from a public interest site (PIS) for which an endorsement from another State is required, the competent authority should only grant such an approval once endorsement of that other State has been received.

AMC2 ARO.OPS.220 Approval of helicopter operations to or from a public interest site

ED Decision 2014/025/R

ENDORSEMENT BY ANOTHER STATE

- (a) Whenever the operator applies for an endorsement to operate to/from a public interest site in another State in accordance with [CAT.POL.H.225](#), the competent authority of that other State should only grant the endorsement once it is satisfied that:
 - (1) the conditions of [CAT.POL.H.225\(a\)\(1\)](#) through (5) can be met by the operator at those sites for which endorsement is requested; and
 - (2) the operations manual includes the procedures to comply with [CAT.POL.H.225\(b\)](#) for these sites for which endorsement is requested.

- (b) The competent authority of that other State should inform the competent authority of the Member State responsible for issuing the approval.

ARO.OPS.225 Approval of fuel/energy schemes

Regulation (EU) 2021/1296

- (a) The competent authority shall approve the fuel/energy scheme proposed by a CAT operator if the operator demonstrates compliance with all applicable requirements laid down in this Regulation related to fuel/energy for aeroplanes or helicopters involved in CAT.
- (b) The competent authority shall assess and oversee the fuel/energy planning and in-flight re-planning, selection of aerodrome and, in-flight fuel/energy management policies associated with the fuel/energy schemes, together with the processes supporting the implementation of these fuel/energy schemes.
- (c) In addition to points (a) and (b), when approving individual fuel/energy schemes, the competent authority shall:
- (1) verify that the operator has demonstrated the baseline safety performance of the current fuel/energy scheme;
 - (2) assess the capability of the operator to support the implementation of the proposed individual fuel/energy scheme; the following elements shall be considered as a minimum:
 - (i) the operator's management system,
 - (ii) the operator's operational capabilities;
 - (3) verify that the operator's safety risk assessment that supports the proposed individual fuel/energy scheme achieves an equivalent level of safety to that of the current fuel/energy scheme; and
 - (4) establish an oversight plan to carry out periodic assessments of the approved individual fuel/energy scheme to verify compliance of the scheme or decide whether the scheme should be amended or revoked.
- (d) The approval referred to in point [CAT.OP.MPA.182 \(d\)\(2\)](#) shall include a list of the isolated aerodromes that are specified by the operator for each aircraft type to which the approval applies.
- (e) Without prejudice to points [ARO.GEN.120 \(d\) and \(e\)](#), the competent authority shall notify the Agency of the start of the evaluation of an alternative means of compliance related to fuel/energy schemes.

AMC1 ARO.OPS.225 Approval of fuel/energy schemes

ED Decision 2022/005/R

OVERSIGHT — VERIFICATION OF COMPLIANCE OF FUEL SCHEMES FOR CAT OPERATIONS WITH AEROPLANES

- (a) When approving a basic fuel scheme, the competent authority should be satisfied that the operator fulfils the applicable criteria of point [CAT.OP.MPA.180\(a\)\(3\)\(i\)](#), taking into account the elements contained in the AMC applicable to the basic fuel scheme.
- (b) When approving a basic fuel scheme with variations, the competent authority should be satisfied that the operator fulfils the applicable criteria of point [CAT.OP.MPA.180\(a\)\(3\)\(ii\)](#), taking into account the elements contained in the AMC applicable to the variation.

- (c) When approving an individual fuel scheme that deviates, fully or partly, from the basic fuel scheme, the competent authority should be satisfied that the operator fulfils the applicable criteria of point [CAT.OP.MPA.180\(a\)\(3\)\(iii\)](#), taking into account the elements contained in the AMC applicable to the individual fuel scheme.

Before issuing the approval of an individual fuel scheme, the competent authority should verify the following:

- (1) the maturity, capability, and suitability of the operator's management system;
- (2) the adequacy of this system for exercising operational control;
- (3) the adequacy of the operator's SOPs;
- (4) the resolution of significant findings in the areas that support the application of the individual fuel scheme;
- (5) the suitability of the communications and navigation equipment of the aircraft fleet to which the individual fuel scheme will apply;
- (6) the areas of operation where the individual fuel scheme will be used;
- (7) the operator's ability to provide reliable and accurate aircraft-specific fuel data;
- (8) the suitability of the relevant training programmes, including those for flight crew and operational control personnel;
- (9) the experience of the personnel concerned, particularly of the flight crew, in the use of the procedures and systems that support the individual fuel scheme;
- (10) any low-fuel events (including emergency fuel conditions) in the operator's safety records; and
- (11) the maintenance of the fleet in terms of reliability of the fuel system, including the accuracy of the fuel-measurement systems.

GM1 ARO.OPS.225 Approval of fuel/energy schemes

ED Decision 2022/005/R

OPERATIONS TO AN ISOLATED AERODROME — GENERAL

The use of an isolated aerodrome exposes both the aircraft and passengers to a greater risk than in operations where a destination alternate aerodrome is available. The competent authority should, therefore, assess whether all possible means are applied to mitigate that greater risk.

GM2 ARO.OPS.225 Approval of fuel/energy schemes

ED Decision 2022/005/R

ASSESSMENT AND OVERSIGHT OF POLICIES ASSOCIATED WITH FUEL SCHEMES

The competent authority's assessment and oversight of:

- the fuel planning and in-flight re-planning policy;
- the selection-of-aerodromes policy; and
- the in-flight fuel management policy

may follow a two-step process: firstly, assess and oversee each policy individually, and secondly, and more importantly, assess and oversee all the policies together.

The competent authority should be satisfied with regard to the following:

- the robustness of the operator's management system, particularly with regard to safety risk management; and
- in case of basic fuel schemes with variations and individual fuel schemes, the operator's processes for performance monitoring and measurement.

AMC1 ARO.OPS.225(c) Approval of fuel/energy schemes

ED Decision 2022/005/R

APPROVAL OF INDIVIDUAL FUEL SCHEMES — QUALIFICATION OF PERSONNEL

- (a) In accordance with point [ARO.GEN.200\(a\)\(2\)](#), the competent authority is required to have qualified personnel to perform the tasks under their responsibility. To approve individual fuel schemes, the competent authority's inspectors should have the necessary knowledge and expertise to understand, monitor, and validate the criteria of point (c) of [AMC1 ARO.OPS.225](#).
- (b) For this purpose, the inspectors should be able to understand the relevance and meaningfulness of the operator's safety performance indicators (SPIs), targets, and means by which these targets are achieved.
- (c) The competent authority should develop guidance to be used by its inspectors when approving and verifying individual fuel schemes.

AMC2 ARO.OPS.225(c) Approval of fuel/energy schemes

ED Decision 2022/005/R

APPROVAL OF INDIVIDUAL FUEL SCHEMES — APPLICATION OF INDIVIDUAL FUEL SCHEMES — GUIDANCE TO PERSONNEL

According to points [ARO.GEN.115](#) and [ARO.GEN.200\(a\)\(1\)](#), the competent authority is required to develop guidance on the application of individual fuel schemes to be used by its inspectors. Such guidance should cover the following:

- (a) the operator's responsibilities:
 - (1) operational control systems (organisational control over internal processes);
 - (2) policies and procedures;
 - (3) qualified personnel:
 - (i) competence and experience of both flight crew and operational control personnel; and
 - (ii) their training;
 - (4) SOP compliance and suitability;
 - (5) monitoring of the effectiveness of individual fuel scheme processes; and
 - (6) continuous improvement;
- (b) operational characteristics:
 - (1) of the aircraft: current aircraft-specific data derived from a fuel consumption monitoring system; and

- (2) of the area of operations:
 - (i) aerodrome technologies;
 - (ii) meteorological information capabilities;
 - (iii) ATM infrastructure; and
 - (iv) aerodrome capabilities and ATS characteristics;
- (3) a suitable computerised flight plan;
- (4) flight monitoring or flight watch capabilities, as applicable;
- (5) communications systems: ground-based and airborne systems;
- (6) navigation systems: ground-based and airborne systems; and
- (7) reliable meteorological and aerodrome information; and
- (c) safety risk management:
 - (1) agreed SPIs;
 - (2) risk register;
 - (3) identification of hazards;
 - (4) risk monitoring; and
 - (5) compliance monitoring.

When collecting statistically relevant data, the competent authority inspectors should consider the specificities of the operations of each operator. As a minimum, the data should be collected for a period of 2 years.

Note: Further guidance is provided in ICAO Doc 9976 Flight Planning and Fuel Management (FPFM) Manual, Appendix 7 to Chapter 5 A performance-based approach job-aid for an approving authority (1st Edition, 2015).

GM1 ARO.OPS.225(c) Approval of fuel/energy schemes

ED Decision 2022/005/R

INDIVIDUAL FUEL SCHEMES — RESOLUTION OF SIGNIFICANT FINDINGS

The approval of an individual fuel scheme may be rejected, suspended or revoked when the operator has not resolved the relevant findings, or when there are unacceptable open findings that affect the areas that support individual fuel schemes (e.g. operational control, safety management system, safety risk assessment processes, availability of data, SPIs, pilot training, etc.).

ARO.OPS.226 Approval and oversight of evidence-based training programmes

Regulation (EU) 2020/2036

- (a) Where a competent authority grants an approval for EBT programmes, inspectors must receive qualification and training in EBT principles, application, approval processes and continuing oversight.
- (b) The competent authority shall assess and oversee the EBT programme, together with the processes that support the implementation of the EBT programme and its effectiveness.

- (c) Upon receiving an application for the approval of an EBT programme, the competent authority shall:
- (1) ensure the resolution of level 1 findings in the areas that will support the application of the EBT programme;
 - (2) assess the capability of the operator to support the implementation of the EBT programme. The following elements shall be considered as a minimum:
 - (i) the maturity and capability of the operator's management system in the areas that will support the application of the EBT programme — in particular, flight crew training;
 - (ii) the operator's EBT programme suitability — the EBT programme shall correspond to the size of the operator, and the nature and complexity of its activities, taking into account the hazards and associated risks inherent in those activities;
 - (iii) the adequacy of the operator's record-keeping system, in particular with regard to flight crew training, checking and qualifications records in particular [ORO.GEN.220](#) and [ORO.MLR.115](#) points (c) and (d);
 - (iv) the suitability of the operator's grading system to assess the pilot competencies;
 - (v) the competence and the experience of the instructors and other personnel involved in the EBT programme in the use of the processes and procedures that support the implementation of the EBT programme; and
 - (vi) the operator's EBT implementation plan and a safety risk assessment supporting the EBT programme in order to demonstrate how an equivalent level of safety to that of the current training programme can be achieved.
- (d) The competent authority shall grant an EBT programme approval when the assessment concludes that the compliance with at least [ORO.FC.146](#), [ORO.FC.231](#), and [ORO.FC.232](#) is ensured.
- (e) Without prejudice to [ARO.GEN.120](#) (d) and (e), the competent authority shall notify the Agency when it starts the evaluation of an alternative means of compliance related to EBT.

AMC1 ARO.OPS.226(a) Approval and oversight of evidence-based training programmes

ED Decision 2021/002/R

QUALIFICATION AND TRAINING — INSPECTORS

- (a) For the initial approval and oversight of an operator's EBT programme, the inspector of the competent authority should undertake EBT training as part of their required technical training (see AMC2 ARO.GEN.200(a)(2)). At the conclusion of the inspector training, the inspector should:
- (1) know the principles of EBT, including the following underlying principles:
 - (i) competency-based training;
 - (ii) learning from positive performance;
 - (iii) building resilience; and;
 - (iv) data-driven training;

- (2) know the structure of an EBT module;
 - (3) know the method of training delivery for each phase of an EBT module;
 - (4) know the principles of adult learning and how they relate to EBT;
 - (5) recognise effective observations based on a competency framework, and document evidence of observed performance;
 - (6) recognise and relate specific performance observations of competencies;
 - (7) recognise trainee performance to determine competency-based training needs and recognise strengths;
 - (8) understand methods for the evaluation of performance using a competency-based grading system;
 - (9) recognise appropriate teaching styles during simulator training to accommodate trainee learning needs;
 - (10) recognise facilitated trainee learning, focusing on specific competency-based training needs; and
 - (11) understand how to conduct a debrief using facilitation techniques.
- (b) The objective of such training is to ensure that the inspector:
- (1) attains the adequate level of knowledge in the principles of approval and oversight of the EBT programmes; and
 - (2) acquires the ability to recognise the EBT programme suitability.

GM1 ARO.OPS.226(a) Approval and oversight of evidence-based training programmes

ED Decision 2021/002/R

QUALIFICATION AND TRAINING — PRINCIPLES OF EBT — DATA-DRIVEN TRAINING

EBT is a data-driven programme and proper oversight requires the inspector to have a good understanding of all features where data plays an important role in the EBT programme:

- (a) Flight crew training data
- (1) Data related to grading of competencies (level 1), data related to OBs (level 2) and how it can be used to drive the design of the operator's EBT programme. Other training data (level 3) and how it is used in the contextualisation of an example scenario element.
 - (2) Individual flight crew training data — understand how it is used:
 - (i) in regard to licence revalidation and renewal; and
 - (ii) to provide tailored training and additional FSTD training.
- (b) Data from the management system — understand how it may be used for the selection of the example scenario element(s) and the contextualisation of the example scenario element(s).
- (c) Instructor standardisation and concordance data
- (1) How the EBT data is used to standardise the instructor and how, at the same time, the operator ensures the necessary just culture and a non-jeopardy environment for the instructors (referred to in the instructor concordance assurance programme).

- (2) Understand the importance of quality in the data – the feedback loop of the EBT programme.

GM2 ARO.OPS.226(a) Approval and oversight of evidence-based training programmes

ED Decision 2021/002/R

QUALIFICATION AND TRAINING — OPERATOR'S EBT PROGRAMME SUITABILITY

To recognise and evaluate the suitability of an operator's EBT programme, the inspector's training programme may include those features as training objectives. AMC1 ORO.FC.231(a) provides the list of features of a suitable EBT programme.

AMC1 ARO.OPS.226(c) Approval and oversight of evidence-based training programmes

ED Decision 2021/002/R

INITIAL APPROVAL — VERIFICATION OF COMPLIANCE

When approving an EBT programme, the competent authority should ensure that the operator fulfils all the applicable criteria of ORO.FC.231 and its associated AMC. In particular, it should recognise the suitability of the operator's EBT programme (AMC1 ORO.FC.231(a)).

AMC2 ARO.OPS.226(c) Approval and oversight of evidence-based training programmes

ED Decision 2021/002/R

EBT PROGRAMME SUITABILITY

As regards the suitability of the EBT programme, please refer to AMC1 ORO.FC.231(a).

AMC1 ARO.OPS.226(d) Approval and oversight of evidence-based training programmes

ED Decision 2021/002/R

OVERSIGHT PLAN — PERIODIC ASSESSMENT TO VERIFY THE COMPLIANCE OF THE EBT PROGRAMME

- (a) After issuing the approval of the operator's EBT programme, the competent authority should have a process to verify the operator's continuing compliance.
- (b) Each organisation to which an EBT approval has been issued should have an inspector (or inspectors) assigned to it who is (are) trained and qualified for EBT (see AMC1 ARO.OPS.226(a)).
- (c) Audits and inspections, on a scale and frequency appropriate to the operation, should cover at least:
 - (1) management supervision of the EBT programme;
 - (2) ongoing identification of operational risks and inclusion into the operator's EBT programme;
 - (3) relevance of the operator's EBT programme to address its operational and training needs;

- (4) effectiveness of the operator's EBT programme to improve pilot competencies. When there is an ineffective programme, the competent authority should examine the operator processes which identify the lack of effective results;
- (5) compliance with all requirements of ORO.FC.231;
- (6) delivery of instructor initial training in accordance with AMC1 ORO.FC.146(c), including inspections of the training delivery;
- (7) conduct of assessments of competence for EBT instructors, including periodic inspections of FSTD training;
- (8) maintenance of crew records;
- (9) administration of programme enrolment and compliance with the requirements of Annex I (Part-FCL) for licence revalidation and renewal;
- (10) continuing standardisation of EBT instructors; and
- (11) inspection of the training delivery.

GM1 ARO.OPS.226(d) Approval and oversight of evidence-based training programmes

ED Decision 2021/002/R

EFFECTIVENESS OF THE OPERATOR'S EBT PROGRAMME

- (a) The effectiveness of the operator's EBT programme can be determined by periodically reviewing pilot competencies across several domains, such as role, fleet (e.g. CPT/FO, A320, B737) and airline so that the continuing improvement of the EBT programme is linked to an improvement of the pilot competencies.
- (b) The analysis of the pilot competencies across the domains should also take into account the operator's experience in the EBT programme and the level of difficulty contained within the scenario elements of the programme, which may result in variations of the grading results and those variations may be acceptable.

GM2 ARO.OPS.226(d) Approval and oversight of evidence-based training programmes

ED Decision 2021/002/R

STANDARDISATION OF EBT INSTRUCTORS — ACCEPTABLE INSTRUCTOR CONCORDANCE

The authority may require a minimum acceptable level of concordance. This may be a non-exhaustive list:

- (a) Set a minimum acceptable level of concordance per aircraft fleet or by group of instructors.
- (b) Set a minimum acceptable level of concordance per competency.
- (c) Set a minimum acceptable level of concordance for all operators under its oversight, or a minimum acceptable level of concordance per operator (or type of operator) based on the risk of the operator.

ARO.OPS.230 Determination of disruptive schedules

Regulation (EU) No 83/2014

For the purpose of flight time limitations, the competent authority shall determine, in accordance with the definitions of “early type” and “late type” of disruptive schedules in point [ORO.FTL.105](#) of Annex III, which of those two types of disruptive schedules shall apply to all CAT operators under its oversight.

ARO.OPS.235 Approval of individual flight time specification schemes

Regulation (EU) No 83/2014

- (a) The competent authority shall approve flight time specification schemes proposed by CAT operators if the operator demonstrates compliance with Regulation (EC) No 216/2008 and Subpart FTL of Annex III to this Regulation.
- (b) Whenever a flight time specification scheme proposed by an operator deviates from the applicable certification specifications issued by the Agency, the competent authority shall apply the procedure described in Article 22(2) of Regulation (EC) No 216/2008.
- (c) Whenever a flight time specification scheme proposed by an operator derogates from applicable implementing rules, the competent authority shall apply the procedure described in Article 14(6) of Regulation (EC) No 216/2008.
- (d) Approved deviations or derogations shall be subject, after being applied, to an assessment to determine whether such deviations or derogations should be confirmed or amended. The competent authority and the Agency shall conduct an independent assessment based on information provided by the operator. The assessment shall be proportionate, transparent and based on scientific principles and knowledge.

GM1 ARO.OPS.235(b);(c) Approval of individual flight time specification schemes

ED Decision 2017/006/R

ICAO DOC 9966 (MANUAL FOR THE OVERSIGHT OF FATIGUE MANAGEMENT APPROACHES)

Further guidance on fatigue risk management processes, appropriate fatigue management, the underlying scientific principles and operational knowledge may be found in ICAO Doc 9966 (Manual for the Oversight of Fatigue Management Approaches).

ARO.OPS.240 Specific approval of RNP AR APCH

Regulation (EU) 2016/1199

- (a) When compliance with the requirements in [SPA.PBN.105](#) has been demonstrated by the applicant, the competent authority shall grant a generic specific approval or a procedure-specific approval for RNP AR APCH.
- (b) In the case of a procedure-specific approval, the competent authority shall:
 - (1) list the approved instrument approach procedures at specific aerodromes in the PBN approval;
 - (2) establish coordination with the competent authorities for these aerodromes, if appropriate; and

- (3) take into account possible credits stemming from RNP AR APCH specific approvals already issued to the applicant.

GM1 ARO.OPS.240 Specific approval of RNP AR APCH

ED Decision 2016/014/R

TEMPORARY LIMITATION ON RVR

Where operators are new to RNP AR APCH operations and their initial application is for RNP < 0.3, it is appropriate to establish a temporary limitation for RVR minima, until operational experience is gained. This period could be based upon time (e.g. 90 days) and a number of conducted operations, as agreed by the competent authority and the operator.

GM2 ARO.OPS.240 Specific approval of RNP AR APCH

ED Decision 2016/014/R

REFERENCES

Additional guidance material for the specific approval of PBN operations, when required, can be found in ICAO Doc 9997 Performance-Based Navigation (PBN) Operational Approval Manual. In particular, a job aid can be found in paragraph 4.7 therein for assessment of applications for RNP AR APCH.

SECTION III – OVERSIGHT OF OPERATIONS

ARO.OPS.300 Introductory flights

Regulation (EU) No 965/2012

The competent authority may establish additional conditions for introductory flights carried out in accordance with Part-NCO in the territory of the Member State. Such conditions shall ensure safe operations and be proportionate.

AMC1 ARO.OPS.300 Introductory flights

ED Decision 2014/025/R

MARGINAL ACTIVITY

The competent authority should publish criteria specifying to which extent it considers an activity marginal and how this is being overseen.

GM1 ARO.OPS.300 Introductory flights

ED Decision 2014/025/R

ADDITIONAL CONDITIONS

For introductory flights carried out in the territory of the Member State, the competent authority may establish additional conditions such as defined area of the operation, time period during which such operations are to be conducted, safety risk assessments to be accomplished, aircraft to be used, specific operating procedures, notification requirements, maximum distance flown, pilot qualification, maximum number of passengers on-board, further restrictions on the maximum take-off mass.

SUBPART RAMP: RAMP INSPECTIONS OF AIRCRAFT OF OPERATORS UNDER THE REGULATORY OVERSIGHT OF ANOTHER STATE

ARO.RAMP.005 Scope

Regulation (EU) No 965/2012

This Subpart establishes the requirements to be followed by the competent authority or the Agency when exercising its tasks and responsibilities regarding the performance of ramp inspections of aircraft used by third country operators or used by operators under the regulatory oversight of another Member State when landed at aerodromes located in the territory subject to the provisions of the Treaty.

GM1 ARO.RAMP.005 Scope

ED Decision 2019/007/R

RAMP INSPECTION MANUAL

The following information may be found in the ramp inspection manual established by the Agency:

- (a) Additional guidance and best practices, in the manual and its attachments;
- (b) Additional provisions which are referenced in AMCs to this subpart, in its appendices.

ARO.RAMP.100 General

Regulation (EU) No 965/2012

- (a) Aircraft, as well as their crew, shall be inspected against the applicable requirements.
- (b) In addition to conducting ramp inspections included in its oversight programme established in accordance with [ARO.GEN.305](#), the competent authority shall perform a ramp inspection of an aircraft suspected of not being compliant with the applicable requirements.
- (c) Within the development of the oversight programme established in accordance with [ARO.GEN.305](#), the competent authority shall establish an annual programme for the conduct of ramp inspections of aircraft. This programme shall:
 - (1) be based on a calculation methodology that takes into account historical information on the number and nature of operators and their number of landings at its aerodromes, as well as safety risks; and
 - (2) enable the competent authority to give priority to the inspections of aircraft on the basis of the list referred to in [ARO.RAMP.105\(a\)](#).
- (d) When it so deems necessary, the Agency, in cooperation with the Member States in whose territory the inspection shall take place, shall conduct ramp inspections of aircraft to verify compliance with the applicable requirements for the purpose of:
 - (1) certification tasks assigned to the Agency by Regulation (EC) No 216/2008;
 - (2) standardisation inspections of a Member State; or

- (3) inspections of an organisation to verify compliance with the applicable requirements in potentially unsafe situations.

AMC1 ARO.RAMP.100(b) General

ED Decision 2019/007/R

SUSPECTED AIRCRAFT

In determining whether an aircraft is suspected of not being compliant with the applicable requirements, the following should be taken into account:

- (a) information regarding poor maintenance of, or obvious damage or defects to an aircraft;
- (b) reports that an aircraft has performed abnormal manoeuvres that give rise to serious safety concerns in the airspace of a Member State;
- (c) a previous ramp inspection that has revealed deficiencies indicating that the aircraft does not comply with the applicable requirements and where the competent authority suspects that these deficiencies have not been corrected;
- (d) lists, referred to in [ARO.RAMP.105](#), indicating that the operator or the State of the operator has been suspected of non-compliance;
- (e) evidence that the State in which an aircraft is registered is not exercising proper safety oversight;
- (f) concerns about the operator of the aircraft that have arisen from occurrence reporting information and non-compliance recorded in a ramp inspection report on any other aircraft used by that operator;
- (g) information received from EASA Third-Country Operator (TCO) monitoring activities; or
- (h) any relevant information collected pursuant to [ARO.RAMP.110](#).

AMC1 ARO.RAMP.100(c) General

ED Decision 2019/007/R

ANNUAL RAMP INSPECTION PROGRAMME

- (a) The competent authority should establish an annual ramp inspection programme and determine the number of inspections for the upcoming calendar year.
- (b) To establish the annual ramp inspection programme, the competent authority should consider layer 1 and layer 2 operators as defined in [AMC1 ARO.RAMP.150\(b\)\(4\)\(iii\)](#).
- (c) For layer 1 operators, the annual ramp inspection programme should meet the target numbers of inspections as assigned by the Agency for the Member State territories in ICAO EUR region.

The assigned targets for layer 1 operators may be exceeded in the following cases:

- (1) operators recently considered in the lists provided by the Agency as per [ARO.RAMP.105\(a\)](#); or
- (2) safety reasons that were not identified in the annual programme.

The competent authority should keep records of the reasons leading to such over-inspections on layer 1 operators.

- (d) For layer 2 operators, the total planned number of inspections as defined in the annual ramp inspection programme should not be less than the layer 2 operators target assigned by the Agency for the Member State territories in ICAO EUR region.
- (e) The annual ramp inspection programme should take seasonal traffic patterns into account and, as far as possible, evenly distribute the inspections over the year.
- (f) The competent authority should ensure that the annual ramp inspection programme leaves appropriate time and resources to enable the inspections of aircraft operated by layer 2 operators suspected of not being compliant with the applicable requirements.
- (g) The competent authority should ensure that layer 2 operators, including unforeseen ones which cannot be a part of the established annual programme, receive inspections proportionate to the traffic pattern in the State. The following priority criteria should be considered before deciding to inspect the aircraft:
 - (1) prioritised ramp inspections as per [ARO.RAMP.105\(a\)](#);
 - (2) aircraft suspected of not being compliant with the applicable requirements; and
 - (3) inspection of an operator which was not inspected in accordance with ARO.RAMP in any State in the previous 12 months;
- (h) The competent authority should amend the annual ramp inspection programme as necessary to the extent possible:
 - (1) when new targets are assigned by the Agency;
 - (2) when new layer 2 operators start operations; or
 - (3) following the identification of a significant increase of the safety risks level as per [ARO.RAMP.100\(c\)\(1\)](#).

ARO.RAMP.105 Prioritisation criteria

Regulation (EU) 2019/1384

- (a) The Agency shall provide competent authorities with a list of operators or aircraft identified as presenting a potential risk, for the prioritisation of ramp inspections.
- (b) This list shall include:
 - (1) operators of aircraft identified on the basis of the analysis of available data in accordance with [ARO.RAMP.150\(b\)\(4\)](#);
 - (2) operators or aircraft communicated to the Agency by the European Commission and identified on the basis of:
 - (i) an opinion expressed by the Air Safety Committee (ASC) within the context of the implementation of Regulation (EC) No 2111/2005 that further verification of effective compliance with relevant safety standards through systematic ramp inspections is necessary; or
 - (ii) information obtained by the European Commission from the Member States pursuant to Article 4(3) of Regulation (EC) No 2111/2005;

- (3) aircraft operated into the territory subject to the provisions of the Treaty by operators included in Annex B of the list of operators subject to an operating ban pursuant to Regulation (EC) No 2111/2005;
 - (4) aircraft operated by operators certified in a State exercising regulatory oversight over operators included in the list referred to in (3);
 - (5) aircraft used by a third-country operator that operates into, within or out of the territory subject to the provisions of the Treaty for the first time or whose authorisation issued in accordance with Regulation (EU) No 452/2014 is limited or reinstated after suspension or revocation.
- (c) The list shall be produced, in accordance with procedures established by the Agency, after every update of the Community list of operators subject to an operating ban pursuant to Regulation (EC) No 2111/2005, and in any case at least once every four months.

ARO.RAMP.106 Alcohol testing

Regulation (EU) 2020/745

- (a) The competent authority shall carry out alcohol testing on flight and cabin crew.
- (b) The Agency shall provide competent authorities with a list of Union and third-country operators for the prioritisation of alcohol testing within the ramp inspection programme in accordance with [ARO.RAMP.105](#) based on a risk assessment performed by the Agency, taking into account the robustness and effectiveness of existing psychoactive testing programmes.
- (c) When selecting operators for alcohol testing of flight and cabin crew, the competent authority shall use the list established in accordance with point (b).
- (d) Whenever data concerning alcohol tests is included in the centralised database in accordance with point (b) of point [ARO.RAMP.145](#), the competent authority shall ensure that such data excludes any personal data of the crew member concerned.
- (e) In case of a reasonable cause or suspicion, alcohol tests may be carried out at any time.
- (f) The alcohol testing methodology shall apply recognised quality standards that ensure accurate testing results.
- (g) A flight crew or cabin crew member who refuses to cooperate during tests or who has been identified to be under the influence of alcohol after a positive test shall not be allowed to continue his or her duty.

AMC1 ARO.RAMP.106 Alcohol testing

ED Decision 2018/012/R

GENERAL — ALCOHOL TESTING METHODOLOGY

- (a) If alcohol testing is carried out by RAMP inspectors under the RAMP inspection programme, the following alcohol testing methodology should be used to ensure accurate testing results.
 - (1) The alcohol test should be carried out with an appropriate and approved testing device in accordance with national requirements on alcohol testing of individuals.
 - (2) The ramp inspector that carries out the alcohol test should be adequately trained and qualified.

- (3) After an initial positive alcohol test, a further confirmation test should be carried out in accordance with national requirements on alcohol testing of individuals.
- (4) Testing procedures should specify the following:
 - (1) Handling of test results, in order to determine a true positive test
 - (2) The process to be followed in case of a confirmed positive test result, including how to inform the crew member concerned about the actual testing result
- (b) Initial alcohol test
 - (1) The initial alcohol test should be carried out using a breath alcohol analyser to ensure that initial alcohol testing is non-invasive.
 - (2) The breath alcohol concentration (BrAC), measured by a breath alcohol analyser during the initial alcohol test, should not exceed a level equivalent to 0.2 grams of blood alcohol concentration (BAC) per litre of blood or the lower of the national statutory limits, whichever is the lower.
- (c) During a confirmation alcohol test, the BAC should not exceed a level equivalent to 0.2 grams per litre of blood or the lower of the national statutory limits, whichever is the lower.
- (d) In case of a positive alcohol test following a confirmation alcohol test or in case of a refusal by the crew member to cooperate during an alcohol test, the competent authority should inform the crew member concerned, as well as the competent authority and the authority responsible for the crew concerned.
- (e) A refusal by a crew member to cooperate during an alcohol test should be regarded in the same way as a positive test and as such should be regarded as a refusal to grant access in accordance with [ORO.GEN.140](#) in the case of an EU operator or in accordance with TCO.115 of Commission Regulation (EU) No 452/2014 in the case of a third-country operator.
- (f) The competent authority should provide information on its alcohol testing procedures in an easily accessible format.

GM1 ARO.RAMP.106 Alcohol testing

ED Decision 2018/012/R

CONDUCT OF THE ALCOHOL TEST

- (a) An alcohol test may be carried out at any time during a ramp inspection.
- (b) In order to ensure sufficient time in case of a confirmation test, following an initial test, the alcohol test should, where possible, be carried out at the start of the inspection.
- (c) At all times when carrying out an alcohol test, the inspector should ensure a testing environment as discreet as possible.

GM2 ARO.RAMP.106 Alcohol testing

ED Decision 2018/012/R

GUIDANCE ON CARRYING OUT A CONFIRMATION ALCOHOL TEST

- (a) The written information after a positive confirmation test provided to the crew member concerned contains information on the time and date of the alcohol test, the equipment used, as well as the actual result of the alcohol test.
- (b) A further confirmation test may be carried out at least 15 minutes, but not more than 30 minutes, after the completion of the initial test. During this time, the inspector should observe that the flight and cabin crew member does not eat or drink or ingest something into their mouth, in order to prevent any accumulation of alcohol in the mouth from leading to an artificially high reading.

GM3 ARO.RAMP.106 Alcohol testing

ED Decision 2018/012/R

INFORMATION ON ALCOHOL TESTING

The information by the competent authority on its alcohol testing procedures should include information on the applicable national statutory limit.

ARO.RAMP.110 Collection of information

Regulation (EU) No 965/2012

The competent authority shall collect and process any information deemed useful for conducting ramp inspections.

AMC1 ARO.RAMP.110 Collection of information

ED Decision 2014/025/R

COLLECTION OF INFORMATION

The information should include:

- (a) important safety information available, in particular, through:
 - (1) pilot reports;
 - (2) maintenance organisation report;
 - (3) incident reports;
 - (4) reports from other organisations, independent from the inspection authorities;
 - (5) complaints; and
 - (6) information received from whistleblowers (such as, but not limited to, ground handling or maintenance personnel) regarding poor maintenance, obvious damage or defects, incorrect loading, etc.

- (b) information on action(s) taken subsequent to a ramp inspection, such as:
 - (1) aircraft grounded;
 - (2) aircraft or operator banned from the Member State pursuant to Article 6 of Regulation (EC) No 2111/2005 of the European Parliament and of the Council¹;
 - (3) corrective action required;
 - (4) contacts with the operator's competent authority; and
 - (5) restrictions on flight operations.
- (c) follow-up information concerning the operator, such as:
 - (1) implementation of corrective action(s); and
 - (2) recurrence of non-compliance.

ARO.RAMP.115 Qualification of ramp inspectors

Regulation (EU) 2019/1384

- (a) The competent authority and the Agency shall have qualified inspectors to conduct ramp inspections.
- (b) Ramp inspectors shall:
 - (1) possess the necessary aeronautical education or practical knowledge relevant to their area(s) of inspection;
 - (2) have successfully completed:
 - (i) appropriate specific theoretical and practical training, in one or more of the following areas of inspection:
 - (A) flight deck;
 - (B) cabin safety;
 - (C) aircraft condition;
 - (D) cargo;
 - (ii) appropriate on-the-job training delivered by a senior ramp inspector appointed by the competent authority or the Agency;
 - (3) maintain the validity of their qualification by undergoing recurrent training and by performing a minimum of 12 inspections per calendar year.
- (c) The training in (b)(2)(i) shall be delivered by the competent authority or by any training organisation approved in accordance with [ARO.RAMP.120\(a\)](#).
- (d) The Agency shall develop and maintain training syllabi and promote the organisation of training courses and workshops for inspectors to improve the understanding and uniform implementation of this Subpart.

¹ Regulation (EC) No 2111/2005 of the European Parliament and of the Council of 14 December 2005 on the establishment of a Community list of air carriers subject to an operating ban within the Community and on informing air transport passengers of the identity of the operating air carrier, and repealing Article 9 of Directive 2004/36/EC (OJ L 344, 27.12.2005, p. 15).

- (e) The Agency shall facilitate and coordinate an inspector exchange programme aimed at allowing inspectors to obtain practical experience and contributing to the harmonisation of procedures.

AMC1 ARO.RAMP.115(a)(b) Qualification of ramp inspectors

ED Decision 2019/007/R

ELIGIBILITY CRITERIA

- (a) The candidate should be considered eligible to become a ramp inspector provided he/she meets the following criteria:
- (1) has good knowledge of the English language attested by a certificate, unless English was used as a medium of instruction during secondary or higher education; and
 - (2) relevant education or training and appropriate recent work experience (over the previous 5 years) in accordance with one of the following items:
 - (i) has successfully completed 3 years of post-secondary education followed by 2 years aeronautical experience in the field of aircraft operations and/or maintenance, and/or personnel licensing;
 - (ii) has or has had a commercial/airline transport pilot licence and carried out such duties;
 - (iii) has or has had a flight engineer licence and carried out such duties;
 - (iv) has been a cabin crew member and carried out such duties in commercial air transport;
 - (v) has been licensed as maintenance personnel and exercised the privileges of such a licence;
 - (vi) has successfully completed professional training in the field of air transport of dangerous goods, followed by experience in this field; or
 - (vii) has successfully completed post-secondary aeronautical education with a duration of at least 3 years, followed by aeronautical experience.

AMC2 ARO.RAMP.115(a)(b) Qualification of ramp inspectors

ED Decision 2019/007/R

QUALIFICATION PROCESS

- (a) The competent authority should ensure that its inspectors meet, at all times, the qualification criteria with regard to training and recent experience.
- (b) Any competent authority or ramp inspection training organisation (RITO) approved in accordance with [ARO.RAMP.120\(a\)](#) may provide the initial theoretical and practical training.
- (c) The senior ramp inspectors delivering the on-the-job training may be appointed by any competent authority.
- (d) The initial theoretical and practical training, as well as the on-the-job training as per [ARO.RAMP.115\(b\)\(2\)](#), should be completed within 12 months. If the qualification of the candidate is not completed within 12 months, the entire process should be re-initiated.

- (e) The competent authority should issue a formal qualification statement, including the inspection privileges, for each candidate who has successfully completed the initial theoretical, practical, and on-the-job-training, as demonstrated by:
 - (1) for theoretical and practical trainings, a satisfactory evaluation by the competent authority or by the RITO which has delivered the training;
 - (2) for on-the-job training, the positive assessment, made by the senior ramp inspectors who have provided the training, of the candidate's ability to effectively perform ramp inspections in an operational environment;
 - (3) a final assessment of the inspector's competency performed at the end of the initial training process by the competent authority.

AMC3 ARO.RAMP.115(a)(b) Qualification of ramp inspectors

ED Decision 2019/007/R

INITIAL THEORETICAL AND PRACTICAL TRAINING

- (a) The initial theoretical and practical training for ramp inspectors should be developed on the basis of the syllabi that are established by the Agency and which are included as appendixes of the ramp inspection manual.
- (b) The duration of the initial theoretical training should be no less than 3 training days, except for cases when previous training can be credited to the candidate, following an assessment made by the competent authority.

In case of an integrated training course, intended to transfer both technical and specific ramp inspection knowledge, the duration of the course should be extended accordingly.
- (c) The duration of the initial practical training should be not less than 1 day. The competent authority of the candidate may decide to lengthen or shorten the training taking into account the level of expertise of the candidate.

AMC4 ARO.RAMP.115(a)(b) Qualification of ramp inspectors

ED Decision 2019/007/R

ON-THE-JOB TRAINING

- (a) The on-the-job training (OJT) should be conducted within the scope defined by [ARO.RAMP.005](#).
- (b) The content of the OJT should be established on the basis of the list of elements to be covered, which is included in appendixes of the ramp inspection manual.
- (c) The competent authority should ensure that only the candidates that have successfully completed the initial theoretical and practical trainings are undertaking the OJT.
- (d) The OJT should comprise 2 phases:
 - (1) Observation:

During this phase, the candidate should accompany and observe a senior ramp inspector performing a series of ramp inspections (including the preparation of the inspection and post-inspection activities such as reporting).

The senior inspector should also provide details on applicable follow-up activities.

- (2) Under supervision:
- During this phase, the candidate should perform ramp inspections under the supervision and guidance of a senior ramp inspector.
- (e) The duration of the OJT should be customised to the individual training needs of each candidate. As a minimum, the OJT should include at least 6 observed ramp inspections and 6 ramp inspections performed under the supervision of a senior ramp inspector, over a period of maximum of 6 months. Notwithstanding (a), up to 3 of these observed ramp inspections and 3 of these inspections under supervision may be performed on national operators, as long as they are performed in accordance with ARO.RAMP.
- (f) The OJT should cover in each phase all inspection items that the inspector will be privileged with, and it should be delivered by senior ramp inspectors who are privileged with the same items.
- (g) The OJT should be documented by the senior ramp inspectors who have provided the training, using OJT forms detailing the training content.
- (h) Certain OJT items may be replaced by alternative training using representative examples when no operational environment is required (e.g. documents, dangerous goods).

AMC5 ARO.RAMP.115(a)(b) Qualification of ramp inspectors

ED Decision 2019/007/R

EXTENSION OF THE RAMP INSPECTOR PRIVILEGES

- (a) The competent authority may extend the privileges of a ramp inspector provided that the following conditions are met:
- (1) the relevant knowledge of the ramp inspector has been satisfactorily complemented by additional theoretical and/or practical training relevant to the scope of the extension; and
 - (2) the ramp inspector has received OJT on the new inspection items that will be added to his/her privileges.
- (b) The competent authority should determine the necessary number of ramp inspections of the OJT on a case-by-case basis, taking into account both the complexity and the criticality of the new items to be covered during this training, as well as the inspector's aeronautical education and practical knowledge.
- (c) Certain OJT items may be replaced by alternative training using representative examples when no operational environment is required (e.g. document inspections, dangerous goods).

AMC6 ARO.RAMP.115(a)(b) Qualification of ramp inspectors

ED Decision 2019/007/R

RECENT EXPERIENCE AND REQUALIFICATION

- (a) The minimum number of inspections to be performed by a ramp inspector to meet the recent experience requirement should be 12 per calendar year.
- (b) Up to half of these ramp inspections may be performed on national operators, as long as they are performed in accordance with ARO.RAMP.

- (c) In the calendar year during which the ramp inspector is qualified, the minimum number of inspections to meet the recent experience requirement should be determined on a pro rata basis.
- (d) When qualification is lost as a result of failure to perform the minimum number of inspections, the ramp inspector may be requalified by the competent authority after having performed at least half of the missing inspections under supervision of a senior inspector within the following calendar year. These inspections under supervision should not be counted for the recent experience requirements for that calendar year. Up to half of these inspections may be performed on national operators, as long as they are performed in accordance with ARO.RAMP.
- (e) If the ramp inspector cannot regain the qualification following the process described in (d), he/she should perform a complete OJT during the calendar year that follows.
- (f) If the ramp inspector fails to regain the qualification following the process described in (e), the conditions for initial qualification should apply.

AMC7 ARO.RAMP.115(a)(b) Qualification of ramp inspectors

ED Decision 2019/007/R

RECURRENT TRAINING

- (a) The competent authority should ensure that all ramp inspectors undergo recurrent training at least once every 3 calendar years.
- (b) In addition, the competent authority should ensure that additional training is provided to all ramp inspectors when information is received from the Agency about the necessity for ad hoc training. In developing such training, the competent authority should take into account any Agency instructions related to the training content and the associated timeframe for implementation. This ad-hoc training may be considered as recurrent training.
- (c) Recurrent training should be delivered by a competent authority, by a ramp inspection training organisation approved in accordance with [ARO.RAMP.120\(a\)](#) or by the Agency.
- (d) The recurrent training should cover at least the following elements:
 - (1) regulatory and procedural developments;
 - (2) operational practices;
 - (3) articulation with other European processes and regulations; and
 - (4) standardisation and harmonisation issues including those communicated by the Agency.

AMC8 ARO.RAMP.115(a)(b) Qualification of ramp inspectors

ED Decision 2019/007/R

SENIOR RAMP INSPECTORS

- (a) The competent authority may appoint senior ramp inspectors provided the appointees meet the following criteria:
 - (1) the appointee has been a qualified ramp inspector over the 36 months preceding his/her appointment; and

- (2) during the period under (1), the appointee has performed a minimum of 72 ramp inspections, with no less than 24 ramp inspections during the last 12 months;
- (b) Senior ramp inspectors should maintain their seniority only if performing at least 24 ramp inspections during each calendar year. Up to 6 of these ramp inspections may be performed on national operators, as long as they are performed in accordance with ARO.RAMP.
- (c) For the calendar year during which the senior inspector was appointed, the recent experience requirements should be applied on a pro rata basis.
- (d) When seniority is lost, but not the ramp inspector qualification, as a result of failure to perform the minimum number of ramp inspections, it can be regained if:
 - (1) the inspector performs 2 ramp inspections under the supervision of a senior ramp inspector; or
 - (2) the inspector performs the missing number of ramp inspections.

These inspections should be performed within the following year, and should not be counted for the recent experience requirements for that year.

The above provision should not be used for two consecutive years.
- (e) If the senior ramp inspector cannot regain his/her seniority following the provisions under (d), the conditions under (a)(2) apply.
- (f) For each appointed senior ramp inspector, the competent authority should establish, based on his/her experience, the privileges for which he/she may deliver OJT.

ARO.RAMP.120 Approval of training organisations

Regulation (EU) No 965/2012

- (a) The competent authority shall approve a training organisation, having its principal place of business in the territory of the respective Member State, when satisfied that the training organisation:
 - (1) has nominated a head of training possessing sound managerial capability to ensure that the training provided is in compliance with the applicable requirements;
 - (2) has available training facilities and instructional equipment suitable for the type of training provided;
 - (3) provides training in accordance with the syllabi developed by the Agency in accordance with [ARO.RAMP.115\(d\)](#);
 - (4) uses qualified training instructors.
- (b) If so requested by the competent authority, the verification of compliance and continuous compliance with the requirements referred to in (a) shall be performed by the Agency.
- (c) The training organisation shall be approved to provide one or more of the following types of training:
 - (1) initial theoretical training;
 - (2) initial practical training;
 - (3) recurrent training.

AMC1 ARO.RAMP.120(a) Approval of training organisations

ED Decision 2019/007/R

APPROVAL OF A RAMP INSPECTION TRAINING ORGANISATION BY THE COMPETENT AUTHORITY

- (a) When evaluating the ramp inspection training organisation's capability to deliver training, the competent authority should verify that the training organisation:
- (1) Has established a detailed description of:
 - (i) the organisational structure;
 - (ii) the facilities and office accommodation;
 - (iii) the instructional equipment;
 - (iv) the instructor recruitment and maintenance of their continuing competence;
 - (v) the record keeping system;
 - (vi) the process for the development of the training course material and its continuous update; and
 - (vii) additional means and methods used to fulfil its tasks,

The documents and information specified above may be included into an organisation manual.
 - (2) Has developed the training course materials adequate for all types of training to be delivered;
 - (3) Ensures compliance with its own procedures on adequate control of the training development, preparation, delivery process and records keeping, as well as compliance with the legal requirements. The training organisation should evaluate the effectiveness of the training provided, based upon written feedbacks collected from course participants after each training delivery.
 - (4) Conducts the training in English with the aim to train trainees in the jargon used during ramp inspections;
- (b) The competent authority should issue the approval for an unlimited duration.

AMC2 ARO.RAMP.120(a) Approval of training organisations

ED Decision 2019/007/R

OVERSIGHT OF APPROVED RAMP INSPECTION TRAINING ORGANISATION

- (a) The oversight programme of ramp inspection training organisations should be developed taking into account the scope of the approval, the size of the organisation, and the results of past certification and/or oversight activities.
- (b) An oversight cycle not exceeding 24 months should be applied. The oversight planning cycle may be extended to a maximum of 48 months if the competent authority has established that during the previous 24 months:
- (1) all corrective actions have been implemented within the time period accepted or extended by the competent authority; and
 - (2) no level 1 findings as described in [ARO.GEN.350](#) have been issued.

AMC1 ARO.RAMP.120(a)(4) Approval of training organisations

ED Decision 2019/007/R

TRAINING INSTRUCTORS

- (a) The competent authority should verify that:
 - (1) the training organisation has a sufficient number of instructors with at least adequate:
 - (i) aviation knowledge and experience;
 - (ii) knowledge of the EU ramp inspection programme;
 - (iii) knowledge of training delivery techniques; and
 - (iv) English language communication skills.
- (b) Instructors delivering training on inspection items and/or delivering practical training should:
 - (1) have been a qualified ramp inspector for 36 months before being nominated as instructors and have performed a minimum of 72 ramp inspections during this period;
 - (2) have conducted at least 24 inspections as qualified ramp inspectors in the calendar year prior to the year in which the training is delivered; and
 - (3) deliver training only on those inspection items which they are entitled to inspect;
- (c) Notwithstanding (a), for the delivery of the theoretical and practical training on Dangerous Goods, the competent authority may accept instructors who are certified in accordance with the Technical Instructions for the latest effective edition of the Safe Transport of Dangerous Goods by Air (ICAO Doc 9284-AN/905), provided that they possess adequate English language communication skills.

ARO.RAMP.125 Conduct of ramp inspections

Regulation (EU) 2019/1384

- (a) Ramp inspections shall be performed in a standardised manner.
- (b) When performing a ramp inspection, the inspector(s) shall make all possible efforts to avoid an unreasonable delay of the aircraft inspected.
- (c) On completion of the ramp inspection, the pilot-in-command or, in his/her absence, another flight crew member or a representative of the operator shall be informed of the ramp inspection's results.

**AMC1 ARO.RAMP.125 Conduct of Ramp Inspections &
ARO.RAMP.130 Categorisation of findings**

ED Decision 2019/007/R

INSPECTION INSTRUCTIONS ON THE CATEGORISATION OF FINDINGS

Inspectors should follow the inspection instructions as defined in the ramp inspection manual on the categorisation of findings established by the Agency for inspections performed on aircraft used by third country operators (SAFA) and on aircraft used by operators under the regulatory oversight of another Member State (SACA).

AMC1 ARO.RAMP.125(b) Conduct of ramp inspections

ED Decision 2019/007/R

GENERAL

- (a) The competent authority should put in place appropriate procedures to allow the inspecting team unrestricted access to the aircraft to be inspected. In this respect ramp inspectors should possess adequate credentials.
- (b) The inspection should start as soon as possible and be as comprehensive as possible within the time and resources available. This means that if only a limited amount of time or resources is available, not all inspection items but a reduced number of them, may be verified. According to the time and resources available for a ramp inspection, the items that are to be inspected should be selected accordingly, in conformity with the objectives of the ramp inspection programme. Items not being inspected may be inspected during a next inspection.
- (c) During the inspection, ramp inspectors should verify the rectification of previously identified non-compliances. Whenever the time available does not permit a full inspection, the items affected by such non-compliances should be prioritised over other items.
- (d) Ramp inspectors should not open by themselves any hatches, doors or panels, which are not intended to be operated by passengers during normal operations, nor should they operate or interfere with any aircraft controls or equipment. When such actions are required for the scope of the inspection, the ramp inspectors should request the assistance of the operator's personnel (flight crew, cabin crew, ground crew).
- (e) During an inspection prior to departure, the competent authority should inform the operator of any potential non-compliance with manufacturer's standards after the crew has confirmed that the pre-flight inspection has been performed.
- (f) The items to be inspected should be selected from the Proof of Inspection (POI).
- (g) Items which have been inspected, as well as any possible findings and observations, should be recorded on the POI and in the ramp inspection tool.

AMC1 ARO.RAMP.125(c) Conduct of ramp inspections

ED Decision 2019/007/R

PROOF OF INSPECTION

- (a) On completion of the ramp inspection, information about its results should be provided to the pilot-in-command/commander or, in his/her absence, to another member of the flight crew or a representative of the operator, using the Proof of Inspection (POI) form provided as an appendix to the ramp inspection manual, regardless of whether or not findings have been identified. When completing the Proof of Inspection (POI), the following should be taken into account:
 - (1) Only the remarks mentioned in the POI should be reported as findings in the final ramp inspection report. Any other relevant information which was not included in the POI should only be reported in the final report as a general remark under 'G' or in the additional information box.
 - (2) When handing over the POI to the pilot-in-command/commander or operator representative, the inspector should ask him/her to sign the POI whilst explaining that the signature does in no way imply acceptance of the listed findings. The signature only

confirms that the POI has been received by the pilot-in-command/operator representative, and that the aircraft has been inspected on the date and at the place indicated. A refusal to sign by the recipient should be recorded in the document.

- (b) POIs may be completed electronically, including the required signatures, and may be printed on site or delivered electronically (e.g. by e-mail).

ARO.RAMP.130 Categorisation of findings

Regulation (EU) No 965/2012

For each inspection item, three categories of possible non-compliance with the applicable requirements are defined as findings. Such findings shall be categorised as follows:

- (1) a category 3 finding is any detected significant non-compliance with the applicable requirements or the terms of a certificate that has a major influence on safety;
- (2) a category 2 finding is any detected non-compliance with the applicable requirements or the terms of a certificate that has a significant influence on safety;
- (3) a category 1 finding is any detected non-compliance with the applicable requirements or the terms a certificate that has a minor influence on safety.

ARO.RAMP.135 Follow-up actions on findings

Regulation (EU) No 965/2012

- (a) For a category 2 or 3 finding the competent authority, or where relevant the Agency, shall:
- (1) communicate the finding in writing to the operator, including a request for evidence of corrective actions taken; and
 - (2) inform the competent authority of the State of the operator and, where relevant, the State in which the aircraft is registered and where the licence of the flight crew was issued. Where appropriate, the competent authority or Agency shall request confirmation of their acceptance of the corrective actions taken by the operator in accordance with [ARO.GEN.350](#) or [ARO.GEN.355](#).
- (b) In addition to (a), in the case of a category 3 finding, the competent authority shall take immediate steps by:
- (1) imposing a restriction on the aircraft flight operation;
 - (2) requesting immediate corrective actions;
 - (3) grounding the aircraft in accordance with [ARO.RAMP.140](#); or
 - (4) imposing an immediate operating ban in accordance with Article 6 of Regulation (EC) No 2111/2005.
- (c) When the Agency has raised a category 3 finding, it shall request the competent authority where the aircraft is landed to take the appropriate measures in accordance with (b).

AMC1 ARO.RAMP.135(a) Follow-up actions on findings

ED Decision 2019/007/R

FOLLOW-UP ACTIONS FOR CATEGORY 2 OR 3 FINDINGS

- (a) Exceptionally, where multiple category 2 findings have been raised and the accumulation of these findings or their interaction justifies corrective action before the flight takes place, the class of action may be increased to the actions foreseen by [ARO.RAMP.135\(b\)](#).
- (b) When communicating findings to the operator, the inspecting authority should:
 - (1) use the ramp inspection tool as the primary communication channel with the operator and limit communication via other channels;
 - (2) request evidence of corrective actions taken, or alternatively the submission of a corrective action plan followed by evidence that planned corrective actions have been taken;
 - (3) inform the operator's competent authority and the operator no later than 15 calendar days after the inclusion of the report in the ramp inspection tool in order to permit appropriate action to be taken, as well as to confirm to the operator the findings raised;
 - (4) upload in the ramp inspection tool information on actions taken and responses provided by the operator following the RAMP inspection and send a communication to the operator only if the operator's actions have not been satisfactory;
 - (5) give the operator a period of 30 calendar days to reply. If the operator does not react to the initial communication within this period, a second request should be sent, including a period of another 30 calendar days to reply whilst copying the operator's competent authority. If the second attempt is also unsuccessful, the operator's competent authority should be requested to encourage the operator to reply. The inspecting authority should indicate in such request that no reaction from the operator could be interpreted as a 'lack of ability and/or willingness of an operator to address safety deficiencies' under Regulation (EC) No 2111/2005.

AMC1 ARO.RAMP.135(b) Follow-up actions on findings

ED Decision 2019/007/R

CLASSES OF ACTIONS FOR CATEGORY 3 FINDINGS

- (a) Whenever restrictions on the aircraft flight operation (Class 3a action) have been imposed, the competent authority should conduct appropriate verification of adherence to such restrictions.
- (b) Whenever the operator is required to take corrective actions before departure (Class 3b action), inspectors should verify that the operator has taken such actions. Depending on the circumstances, this verification may take place after the departure.
- (c) Whenever a category 3 finding is raised, the aircraft should be grounded only (Class 3c action) if the crew refuses to take the necessary corrective actions or to respect imposed restrictions on the aircraft flight operation. However, grounding might be appropriate if an operator refuses to grant access in accordance with [ORO.GEN.140](#) (in case of an EU operator) or contrary to Regulation (EU) 452/2014 (in case of a third country operator). The inspecting authority should then ensure that the aircraft will not depart as long as the reasons for the grounding remain. Any records of communication undertaken pursuant to [ARO.RAMP.140\(b\)](#), as well as other evidences, should be collected and kept as evidential material.

- (d) If inspectors have imposed any restrictions and/or corrective actions, these should be mentioned in the ramp inspection report.

ARO.RAMP.140 Grounding of aircraft

Regulation (EU) 2019/1384

- (a) In the case of a category 3 finding where it appears that the aircraft is intended or is likely to be flown without completion by the operator or owner of the appropriate corrective action, the competent authority shall:
- (1) notify the pilot-in-command/commander or the operator that the aircraft is not permitted to commence the flight until further notice; and
 - (2) ground that aircraft.
- (b) The competent authority of the State where the aircraft is grounded shall immediately inform the competent authority of the State of the operator and of the State in which the aircraft is registered, if relevant, and the Agency in the case of a grounded aircraft used by a third-country operator.
- (c) The competent authority shall, in coordination with the State of the operator or the State of Registry, prescribe the necessary conditions under which the aircraft can be allowed to take-off.
- (d) If the non-compliance affects the validity of the certificate of airworthiness of the aircraft, the grounding shall only be lifted by the competent authority when the operator shows evidence that:
- (1) compliance with the applicable requirements has been re-established;
 - (2) it has obtained a permit-to-fly in accordance with Regulation (EU) No 748/2012, for aircraft registered in a Member State;
 - (3) a permit-to-fly or equivalent document of the State of Registry or the State of the operator for aircraft registered in a third country and operated by an EU or a third country operator; and
 - (4) permission from third countries which will be overflown, if applicable.

ARO.RAMP.145 Reporting

Regulation (EU) No 965/2012

- (a) Information collected in accordance with [ARO.RAMP.125\(a\)](#) shall be entered into the centralised database referred to in [ARO.RAMP.150\(b\)\(2\)](#), within 21 calendar days after the inspection.
- (b) The competent authority or the Agency shall enter into the centralised database any information useful for the application of Regulation (EC) No 216/2008 and its Implementing Rules and for the accomplishment by the Agency of the tasks assigned to it by this Annex, including the relevant information referred to in [ARO.RAMP.110](#).
- (c) Whenever the information as referred to in [ARO.RAMP.110](#) shows the existence of a potential safety threat, such information shall also be communicated to each competent authority and the Agency without delay.

- (d) Whenever information concerning aircraft deficiencies is given by a person to the competent authority, the information referred to in [ARO.RAMP.110](#) and [ARO.RAMP.125\(a\)](#) shall be de-identified regarding the source of such information.

AMC1 ARO.RAMP.145 Safety reports

ED Decision 2019/007/R

IMPORTANT SAFETY INFORMATION

- (a) When the competent authority receives safety-related information that could be of interest to the entire RAMP community, it should create a 'safety report' and insert it into the ramp inspection tool pursuant to [ARO.RAMP.110](#).
- (b) Safety-related information should be verified by the reporting authority, as far as possible, before insertion in the ramp inspection tool.
- (c) If available, any relevant information contained in documents and pictures should be attached to the 'safety report'.

ARO.RAMP.150 Agency coordination tasks

Regulation (EU) 2019/1384

- (a) The Agency shall manage and operate the tools and procedures necessary for the storage and exchange of:
- (1) the information referred to in [ARO.RAMP.145](#);
 - (2) the information provided by third countries or international organisations with whom appropriate agreements have been concluded with the EU, or organisations with whom the Agency has concluded appropriate arrangements in accordance with Article 27(2) of Regulation (EC) No 216/2008.
- (b) This management shall include the following tasks:
- (1) store data from the Member States relevant to the safety information on aircraft landing at aerodromes located in the territory subject to the provisions of the Treaty;
 - (2) develop, maintain and continuously update a centralised database containing all the information referred to in (a)(1) and (2);
 - (3) provide necessary changes and enhancements to the database application;
 - (4) analyse the centralised database and other relevant information concerning the safety of aircraft and of air operators and, on that basis:
 - (i) advise the Commission and the competent authorities on immediate actions or follow-up policy;
 - (ii) report potential safety problems to the Commission and to the competent authorities;
 - (iii) propose coordinated actions to the Commission and to the competent authorities, when necessary on safety grounds, and ensure coordination at the technical level of such actions;

- (5) liaise with other European institutions and bodies, international organisations and third country competent authorities on information exchange.

AMC1 ARO.RAMP.150(b)(4)(iii) Agency coordination tasks

ED Decision 2019/007/R

SYSTEM-WIDE COORDINATION OF RAMP INSPECTIONS

In order to ensure a coordinated approach in establishing a risk-based number of ramp inspections for operators, the Agency should establish annual targets. When doing so, the following should be taken into account:

- (a) Such targets should only be established for operators flying to Member States' territories located in the ICAO EUR region;
- (b) The targets for the upcoming year should be distributed to the Member States at the latest by 1 December and updated at least once during the upcoming year; and
- (c) The targets should be established per Member State for two layers of operators as follows:
 - (1) a target number of inspections for each operator for which the average number of commercial flights for the previous 12 months in each Member State is beyond a threshold defined by the Agency, based on an assessment of the safety risks and the number of flights ('layer 1');
 - (2) an overall target number of inspections for those operators not covered by (1) ('layer 2').

ARO.RAMP.155 Annual report

Regulation (EU) No 965/2012

The Agency shall prepare and submit to the Commission an annual report on the ramp inspection system containing at least the following information:

- (a) status of the progress of the system;
- (b) status of the inspections performed in the year;
- (c) analysis of the inspection results with indication of the categories of findings;
- (d) actions taken during the year;
- (e) proposals for further improving the ramp inspection system; and
- (f) annexes containing lists of inspections sorted out by State of operation, aircraft type, operator and ratios per item.

ARO.RAMP.160 Information to the public and protection of information

Regulation (EU) No 965/2012

- (a) Member States shall use the information received by them pursuant to [ARO.RAMP.105](#) and [ARO.RAMP.145](#) solely for the purpose of Regulation (EC) No 216/2008 and its implementing rules and shall protect it accordingly.

- (b) The Agency shall publish an aggregated information report annually that shall be available to the public containing the analysis of the information received in accordance with [ARO.RAMP.145](#). The report shall be simple and easy to understand, and the source of the information shall be de-identified.

Use of type B EFB applications	<input type="checkbox"/>	<input type="checkbox"/>	⁽²²⁾	
Continuing airworthiness	<input type="checkbox"/>	<input type="checkbox"/>	⁽²³⁾	
Others ⁽²⁴⁾				

- (1) Telephone contact details of the competent authority, including the country code. Email to be provided as well as fax if available.
- (2) Insertion of associated air operator certificate (AOC) number.
- (3) Insertion of the operator's registered name and the operator's trading name, if different. Insert 'DbA' before the trading name (for 'Doing business as').
- (4) Issue date of the operations specifications (dd-mm-yyyy) and signature of the competent authority representative.
- (5) Insertion of ICAO designation of the aircraft make, model and series, or master series, if a series has been designated (e.g. Boeing-737-3K2 or Boeing-777-232).
- (6) The registration marks are listed either in the operations specifications or in the operations manual. In the latter case, the related operations specifications must make a reference to the related page in the operations manual. In case not all specific approvals apply to the aircraft model, the registration marks of the aircraft may be entered in the remark column to the related specific approval.
- (7) Other type of transportation to be specified (e.g. emergency medical service).
- (8) Listing of geographical area(s) of authorised operation (by geographical coordinates or specific routes, flight information region or national or regional boundaries).
- (9) Listing of applicable special limitations (e.g. VFR only, Day only, etc.).
- (10) List in this column the most permissive criteria for each approval or the approval type (with appropriate criteria).
- (11) Insertion of approved minimum take-off RVR in metres. One line per approval may be used if different approvals are granted.
- (12) Insertion of applicable precision approach category: CAT II or CAT III. Insertion of minimum RVR in metres and DH in feet. One line is used per listed approach category.
- (13) Insertion of applicable operational credit: SA CAT I, SA CAT II, EFVS, etc. Insertion of minimum RVR in metres and DH in feet. One line is used per listed operational credit.
- (14) The Not Applicable (N/A) box may be checked only if the aircraft maximum ceiling is below FL290.
- (15) Extended range operations (ETOPS) currently applies only to two-engined aircraft. Therefore, the Not Applicable (N/A) box may be checked if the aircraft model has less or more than two engines.
- (16) The threshold distance may also be listed (in NM), as well as the engine type.
- (17) Performance-based navigation (PBN): one line is used for each complex PBN specific approval (e.g. RNP AR APCH), with appropriate limitations listed in the 'Specifications' or 'Remarks' columns, or in both. Procedure-specific approvals of specific RNP AR APCH procedures may be listed in the operations specifications or in the operations manual. In the latter case, the related operations specifications must have a reference to the related page in the operations manual.
- (18) Specify if the specific approval is limited to certain runway ends or aerodromes, or both.
- (19) Insertion of the particular airframe or engine combination.
- (20) Approval to conduct the training course and examination to be completed by applicants for a cabin crew attestation as specified in Annex V (Part-CC) to [Regulation \(EU\) No 1178/2011](#).
- (21) Approval to issue cabin crew attestations as specified in Annex V (Part-CC) to [Regulation \(EU\) No 1178/2011](#).
- (22) Insertion of the list of type B EFB applications together with the reference of the EFB hardware (for portable EFBs). This list is contained either in the operations specifications or in the operations manual. In the latter case, the related operations specifications must make a reference to the related page in the operations manual.
- (23) The name of the person or organisation responsible for ensuring that the continuing airworthiness of the aircraft is maintained and a reference to the regulation that requires the work, i.e. Subpart G of Annex I (Part-M) to [Regulation \(EU\) No 1321/2014](#).
- (24) Other approvals or data may be entered here, using one line (or one multi-line block) per authorisation (e.g. short landing operations, steep approach operations, reduced required landing distance, helicopter operations to or from a public interest site, helicopter operations over a hostile environment located outside a congested area, helicopter operations without a safe forced landing capability, operations with increased bank angles, maximum distance from an adequate aerodrome for two-engined aeroplanes without an ETOPS approval).

In addition, an official stamp may be applied on the authorisation.	

EASA FORM 151 Issue 2

ANNEX III (PART-ORO)

ORO.GEN.005 Scope

Regulation (EU) No 379/2014

This Annex establishes requirements to be followed by an air operator conducting:

- (a) commercial air transport operations (CAT);
- (b) commercial specialised operations;
- (c) non-commercial operations with complex motor-powered aircraft;
- (d) non-commercial specialised operations with complex motor-powered aircraft.

SUBPART GEN: GENERAL REQUIREMENTS

SECTION 1 – GENERAL

ORO.GEN.105 Competent authority

Regulation (EU) No 379/2014

For the purpose of this Annex, the competent authority exercising oversight over operators subject to a certification or declaration obligation or specialised operation authorisation shall be for operators having their principal place of business in a Member State, the authority designated by that Member State.

ORO.GEN.110 Operator responsibilities

Regulation (EU) 2019/1384

- (a) The operator is responsible for the operation of the aircraft in accordance with Annex IV to Regulation (EC) No 216/2008, as applicable, the relevant requirements of this Annex and its air operator certificate (AOC) or specialised operation authorisation (SPO authorisation) or declaration.
- (b) Every flight shall be conducted in accordance with the provisions of the operations manual.
- (c) The operator shall establish and maintain a system for exercising operational control over any flight operated under the terms of its certificate, SPO authorisation or declaration.
- (d) The operator shall ensure that its aircraft are equipped and its crews are qualified as required for the area and type of operation.
- (e) The operator shall ensure that all personnel assigned to, or directly involved in, ground and flight operations are properly instructed, have demonstrated their abilities in their particular duties and are aware of their responsibilities and the relationship of such duties to the operation as a whole.
- (f) The operator shall establish procedures and instructions for the safe operation of each aircraft type, containing ground staff and crew member duties and responsibilities, for all types of operation on the ground and in flight. Those procedures and instructions shall not require crew members to perform any activities during critical phases of flight other than those required for the safe operation of the aircraft. Procedures and instructions for a sterile flight crew compartment shall also be included.
- (g) The operator shall ensure that all personnel are made aware that they shall comply with the laws, regulations and procedures of those States in which operations are conducted and that are pertinent to the performance of their duties.
- (h) The operator shall establish a checklist for each aircraft type to be used by crew members in all phases of flight under normal, abnormal and emergency conditions in order to ensure that the operating procedures in the operations manual are followed. The design and the usage of checklists shall observe human factors principles and take into account the latest relevant documentation from the design approval holder.
- (i) The operator shall specify flight planning procedures to provide for the safe conduct of the flight based on considerations of aircraft performance, other operating limitations and relevant

expected conditions on the route to be followed and at the aerodromes or operating sites concerned. These procedures shall be included in the operations manual.

- (j) The operator shall establish and maintain dangerous goods training programmes for personnel as required by the technical instructions. Such training programmes shall be commensurate with the responsibilities of personnel. Training programmes of operators performing CAT, whether they transport dangerous goods or not, and of operators conducting operations other than CAT referred to in points (b), (c) and (d) of point [ORO.GEN.005](#) that transport dangerous goods shall be subject to review and approval by the competent authority.
- (k) Notwithstanding point (j), operators conducting commercial operations with either of the following aircraft shall ensure that the flight crew has received an appropriate dangerous goods training or briefing, to enable them to recognise undeclared dangerous goods brought on board by passengers or as cargo:
 - (1) a single-engined propeller-driven aeroplane having an MCTOM of 5 700 kg or less and a MOPSC of 5 or less, operated in a flight taking off and landing at the same aerodrome or operating site, under VFR by day;
 - (2) an other-than-complex motor-powered helicopter, single-engined, with an MOPSC of 5 or less, operated in a flight taking off and landing at the same aerodrome or operating site, under VFR by day.

AMC1 ORO.GEN.110(a) Operator responsibilities

ED Decision 2015/005/R

SECURITY TRAINING PROGRAMME FOR CREW MEMBERS — CAT OPERATIONS

Without prejudice to Regulation (EC) No 300/2008, the CAT operator should establish and maintain a security training programme for crew members, including theoretical and practical elements. This training should be provided at the time of operator conversion training and thereafter at intervals not exceeding three years. The content and duration of the training should be adapted to the security threats of the individual operator and should ensure that crew members act in the most appropriate manner to minimise the consequences of acts of unlawful interference. This programme should include the following elements:

- (a) determination of the seriousness of the occurrence;
- (b) crew communication and coordination;
- (c) appropriate self-defence responses;
- (d) use of non-lethal protective devices assigned to crew members whose use is authorised by the Member State;
- (e) understanding of behaviour of terrorists so as to facilitate the ability of crew members to cope with hijacker behaviour and passenger responses;
- (f) in case where cabin crew are required, live situational training exercises regarding various threat conditions;
- (g) flight crew compartment procedures to protect the aircraft;
- (h) aircraft search procedures, in accordance with Regulation (EC) No 300/2008, including identification of prohibited articles; and
- (i) guidance on the least risk bomb locations.

AMC2 ORO.GEN.110(a) Operator responsibilities

ED Decision 2015/005/R

SECURITY TRAINING PROGRAMME FOR GROUND PERSONNEL — CAT OPERATIONS

In accordance with Regulation (EC) No 300/2008, the CAT operator should establish and maintain a security training programme for ground personnel to acquaint appropriate employees with preventive measures and techniques in relation to passengers, baggage, cargo, mail, equipment, stores and supplies intended for carriage so that they contribute to the prevention of acts of sabotage or other forms of unlawful interference.

GM1 ORO.GEN.110(a) Operator responsibilities

ED Decision 2015/005/R

SECURITY TRAINING PROGRAMME FOR CREW MEMBERS

ICAO Security Manual Doc 9811 (restricted access) contains guidance on the development of training programmes.

AMC1 ORO.GEN.110(c) Operator responsibilities

ED Decision 2014/017/R

OPERATIONAL CONTROL

The organisation and methods established to exercise operational control should be included in the operations manual and should cover at least a description of responsibilities concerning the initiation, continuation and termination or diversion of each flight.

GM1 ORO.GEN.110(c) Operator responsibilities

ED Decision 2022/005/R

OPERATIONAL CONTROL

- (a) Point [ORO.GEN.110\(c\)](#) does not imply a requirement for licensed flight operations officers/flight dispatchers.
- (b) If the operator uses flight operations officers (FOOs)/flight dispatchers (FDs) in conjunction with a method of operational control, training for that personnel should be based on the relevant parts of ICAO Annex 1 and ICAO Documents 10106 and 9868. This training should be described in the OM.

AMC1 ORO.GEN.110(c)&(e) Operator responsibilities

ED Decision 2022/005/R

PERSONNEL RESPONSIBILITIES — OPERATIONAL CONTROL PERSONNEL THAT PERFORM TASKS RELATED TO FLIGHT MONITORING AND FLIGHT WATCH — TRAINING PROGRAMME

- (a) When a CAT operator uses flight monitoring or flight watch as functions of a system for exercising operational control, FOOs/FDs should perform those functions.
- (b) The CAT operator should develop a training programme, based on the relevant parts of ICAO Annex 1, ICAO Documents 10106 and 9868, for FOOs/FDs that perform those functions.
- (c) The training programme specified above should be detailed in the OM of the CAT operator and should be delivered by an instructor for operational control personnel.

INITIAL TRAINING

- (d) The initial training should include, where relevant to the intended operation, the following elements that should be tailored to the specific duties assigned to each person:
- (1) air law:
 - rules and regulations relevant to the task assignment, appropriate ATS practices and procedures;
 - (2) aircraft general knowledge:
 - (i) principles of operation of aeroplane engines/systems/instruments;
 - (ii) operating limitations of aeroplanes and engines; and
 - (iii) MEL and configuration deviation list (CDL);
 - (3) flight performance calculation, planning procedures, and loading:
 - (i) effects of loading and mass distribution on aircraft performance and flight characteristics; mass and balance calculations;
 - (ii) operational flight planning; fuel consumption and endurance calculations; alternate aerodrome selection procedures; en-route cruising control; extended range operation;
 - (iii) preparation and filing of ATS flight plans; and
 - (iv) basic principles of computer-assisted planning systems;
 - (4) human performance:
 - human performance related to operational control duties, including principles of threat and error management (TEM); guidance material on how to design training programmes on human performance, including on TEM, is provided in ICAO Doc 9683 Human Factors Training Manual;
 - (5) meteorology:
 - (A) aeronautical meteorology; movement of pressure systems; structure of fronts; origin and characteristics of significant weather phenomena that affect take-off, en-route, and landing conditions;
 - (B) interpretation and application of aeronautical meteorological reports, charts, and forecasts; codes and abbreviations; use of, and procedures for, obtaining meteorological information;
 - (C) effects of meteorological conditions on aircraft operation and on radio reception in the aircraft that is used by the operator; and
 - (D) all-weather operations;
 - (6) navigation:
 - (A) principles of air navigation with particular reference to IFR; and
 - (B) navigation and radio equipment in the aircraft that is used by the operator;

- (7) operational procedures:
 - (A) use of aeronautical documentation and SOPs;
 - (B) procedures for operations beyond 60 minutes from an adequate aerodrome, including, if applicable, extended-diversion-time operations (EDTOs);
 - (C) operational procedures for the carriage of cargo and dangerous goods;
 - (D) de-icing/anti-icing;
 - (E) procedures related to aircraft accidents and incidents; emergency flight procedures; and
 - (F) security procedures related to unlawful interference and sabotage of aircraft;
- (8) principles of flight:

principles of flight related to the appropriate category of aircraft;
- (9) radio communications:

procedures for communicating with other aircraft and ground stations; and
- (10) special aerodromes.

OPERATOR-SPECIFIC TRAINING

- (e) In addition to the initial training, FOOs/FDs should receive training in the specific duties, responsibilities, and tools that are associated with the operational control system of the operator.

RECURRENT TRAINING

- (f) When the recurrent training is conducted within the last 12 months of a 36-month validity period, the next 36-month validity period should be calculated from the original expiry date of the previous assessment.
- (g) Notwithstanding the 36-month interval of point (f), recurrent training may also be performed at shorter intervals and adjusted to the needs identified after an assessment of the training needs conducted by the operator.

KNOWLEDGE, SKILLS, AND QUALIFICATIONS FOR INSTRUCTORS OF OPERATIONAL CONTROL PERSONNEL

- (h) Unless otherwise required by the relevant national regulations, instructors for operational control personnel should:
 - (1) be able to prove that they are current in the subjects covered by the training programme for FOOs/FDs, including the operator-specific elements, or otherwise successfully complete an FOO/FD training programme;
 - (2) have adequate instructional skills or attend instructor training; if more than 24 months have passed since the delivery of the last FOO/FD course, they should attend recurrent instructor training before delivering the next course; and
 - (3) have relevant work experience in the areas of the training that they provide.
- (i) The CAT operator should include in the OM the required knowledge, skills, and qualifications of the instructors for operational control personnel.

AMC1 ORO.GEN.110(e) Operator responsibilities

ED Decision 2017/007/R

MEL TRAINING PROGRAMME

- (a) The operator should develop a training programme for ground personnel dealing with the use of the MEL and detail such training in the continuing airworthiness maintenance exposition CAME and OM as appropriate. Such training programme should include:
 - (1) the scope, extent and use of the MEL;
 - (2) placarding of inoperative equipment;
 - (3) deferral procedures;
 - (4) dispatching; and
 - (5) any other operator's MEL related procedures.
- (b) The operator should develop a training programme for crew members and detail such training in the Operations Manual. Such training programme should include:
 - (1) the scope, extent and use of the MEL;
 - (2) the operator's MEL procedures;
 - (3) elementary maintenance procedures in accordance with Commission Regulation (EU) No 1321/2014; and
 - (4) pilot-in-command/commander responsibilities.

AMC2 ORO.GEN.110(e) Operator responsibilities

ED Decision 2015/005/R

GROUND OPERATIONS WITH PASSENGERS ON BOARD IN THE ABSENCE OF FLIGHT CREW

For ground operations, whenever passengers are embarking, on board or disembarking in the absence of flight crew members, the operator should:

- (a) establish procedures to alert the aerodrome services in the event of ground emergency or urgent need; and
- (b) ensure that at least one person on board the aircraft is qualified to apply these procedures and ensure proper coordination between the aircraft and the aerodrome services.

GM1 ORO.GEN.110(e) Operator responsibilities

ED Decision 2014/017/R

GROUND PERSONNEL

For the purpose of the MEL training programme referred to in [AMC1 ORO.GEN.110\(e\)](#) ground personnel include maintenance personnel, flight dispatchers and operations officers.

GM2 ORO.GEN.110(e) Operator responsibilities

ED Decision 2015/005/R

AERODROME SERVICES

Aerodrome services refer to units available at an aerodrome that could be of assistance in responding to an urgent need or an emergency, such as rescue and firefighting services, medical and ambulance services, air traffic services, security services, police, aerodrome operations, air operators.

AMC1 ORO.GEN.110(f) Operator responsibilities

ED Decision 2015/005/R

STERILE FLIGHT CREW COMPARTMENT

- (a) Sterile flight crew compartment procedures should ensure that:
 - (1) flight crew activities are restricted to essential operational activities; and
 - (2) cabin crew and technical crew communications to flight crew or entry into the flight crew compartment are restricted to safety or security matters.
- (b) The sterile flight crew compartment procedures should be applied:
 - (1) during critical phases of flight;
 - (2) during taxiing (aeroplanes);
 - (3) below 10 000 feet above the aerodrome of departure after take-off and the aerodrome of destination before landing, except for cruise flight; and
 - (4) during any other phases of flight as determined by the pilot-in-command or commander.
- (c) All crew members should be trained on sterile flight crew compartment procedures established by the operator, as appropriate to their duties.

AMC2 ORO.GEN.110(f) Operator responsibilities

ED Decision 2022/005/R

INSTRUCTIONS ABOUT DUTIES AND RESPONSIBILITIES OF PERSONNEL — BRIEFING OF FLIGHT OPERATIONS OFFICERS/FLIGHT DISPATCHERS BEFORE ASSUMING DUTIES

In the context of an ongoing flight-following, flight-monitoring, or flight-watch activity, an FOO/FD, before assuming duties, should be briefed on the elements related to the safety of the operations the FOO/FD will be performing as part of the operational control.

GM1 ORO.GEN.110(f) Operator responsibilities

ED Decision 2015/005/R

STERILE FLIGHT CREW COMPARTMENT

- (a) Establishment of procedures

The operator should establish procedures for flight, cabin, and technical crew that emphasise the objectives and importance of the sterile flight crew compartment. These procedures should also emphasise that, during periods of time when the sterile flight deck compartment procedures are applied, cabin crew and technical crew members should call the flight crew or enter the flight crew compartment only in cases related to safety or security matters. In such cases, information should be timely and accurate.

(b) Flight crew activities

When sterile flight crew compartment procedures are applied, flight crew members are focused on their essential operational activities without being disturbed by non-safety related matters. Examples of activities that should not be performed are:

- (1) radio calls concerning passenger connections, fuel loads, catering, etc.;
- (2) non-critical paperwork; and
- (3) mass and balance corrections and performance calculations, unless required for safety reasons.

(c) Communication to the flight crew

Cabin crew and technical crew use their own discretion to determine whether the situation is related to safety or security matters and whether to call the flight crew. Situations requiring information to the flight crew may include:

- (1) any outbreak of fire inside the cabin or in an engine;
- (2) a burning smell in the cabin or presence of smoke inside or outside;
- (3) fuel or fluid leakage;
- (4) exit door unable to be armed or disarmed;
- (5) localised extreme cabin temperature changes;
- (6) evidence of airframe icing;
- (7) cabin/galley equipment or furniture malfunction/breakage posing a hazard to the occupants;
- (8) suspicious object;
- (9) disruptive passenger;
- (10) security threat;
- (11) abnormal vibration or noise;
- (12) medical emergency;
- (13) general drop-down of the oxygen masks in the cabin; and
- (14) any other condition deemed relevant by a cabin crew or technical crew member.

GM2 ORO.GEN.110(f) Operator responsibilities*ED Decision 2022/014/R***ELEMENTS OF THE BRIEFING GIVEN TO FLIGHT OPERATIONS OFFICERS/FLIGHT DISPATCHERS BEFORE ASSUMING DUTIES**

Before commencing their shift, the FOO/FD should be briefed on relevant safety information such as:

- (a) weather charts;
- (b) weather reports;
- (c) NOTAMs;
- (d) operational restrictions in force;

- (e) flights in the air and flights for which operational flight plans have been issued but which have not yet started and for which the FOO/FD will be responsible;
- (f) the forecast flight schedule; and
- (g) other relevant safety information as listed in [GM28 Annex I 'Definitions for terms used in Annexes II to VIII'](#).

AMC1 ORO.GEN.110(f)(h) Operator responsibilities

ED Decision 2019/019/R

ESTABLISHMENT OF PROCEDURES

- (a) An operator should establish procedures to be followed by cabin crew covering at least:
 - (1) arming and disarming of slides;
 - (2) operation of cabin lights, including emergency lighting;
 - (3) prevention and detection of cabin, galley and toilet fires;
 - (4) actions to be taken when turbulence is encountered;
 - (5) actions to be taken in the event of an emergency and/or an evacuation; and
 - (6) safety aspects of the in-flight entertainment (IFE) system, if installed.
- (b) When establishing procedures and a checklist system for cabin crew with respect to the aircraft cabin, the operator should take into account at least the following duties:

Duties	Pre-take off	In-flight	Pre-landing	Post-landing
(1) Briefing of cabin crew by the senior cabin crew member prior to commencement of a flight or series of flights	x			
(2) Check of safety and emergency equipment in accordance with operator's policies and procedures	x			
(3) Security checks as applicable	x			x
(4) Passenger embarkation and disembarkation	x			x
(5) Securing of passenger cabin (e.g. seat belts, cabin cargo/baggage, IFE system)	x		x	
(6) Securing of galleys and stowage of equipment	x	if required	x	
(7) Arming of door/exit slides	x			
(8) Safety briefing/information to passengers	x	x	x	x
(9) 'Cabin secure' report to flight crew	x	if required	x	
(10) Operation of cabin lights	x	if required	x	x
(11) Safety aspects of the IFE system (if installed)	x	x	x	x
(12) Cabin crew at assigned crew stations	x	if required	x	x
(13) Surveillance of passenger cabin	x	x	x	x

Duties	Pre-take off	In-flight	Pre-landing	Post-landing
(14) Prevention and detection of fire in the cabin (including the combi-cargo area, crew rest areas, galleys, lavatories and any other cabin remote areas) and instructions for actions to be taken	x	x	x	x
(15) Actions to be taken when turbulence is encountered		x		
(16) Actions to be taken in case of in-flight incidents (e.g. medical emergency)		x		
(17) Actions to be taken in the event of emergency situations	x	x	x	x
(18) Disarming of door/exit slides				x
(19) Reporting of any deficiency and/or un-serviceability of equipment and/or any incident	x	x	x	x

- (c) The operator should specify the contents of safety briefings for all cabin crew members prior to the commencement of a flight or series of flights.

ORO.GEN.115 Application for an AOC

Regulation (EU) No 379/2014

- (a) The application for an air operator certificate or an amendment to an existing certificate shall be made in a form and manner established by the competent authority, taking into account the applicable requirements of Regulation (EC) No 216/2008 and its Implementing Rules.
- (b) Applicants for an initial certificate shall provide the competent authority with documentation demonstrating how they will comply with the requirements established in Regulation (EC) No 216/2008 and its Implementing Rules. Such documentation shall include a procedure describing how changes not requiring prior approval will be managed and notified to the competent authority.

ORO.GEN.120 Means of compliance

Regulation (EU) No 379/2014

- (a) Alternative means of compliance to those adopted by the Agency may be used by an operator to establish compliance with Regulation (EC) No 216/2008 and its Implementing Rules.
- (b) When an operator subject to certification wishes to use an alternative means of compliance to the acceptable means of compliance (AMC) adopted by the Agency to establish compliance with Regulation (EC) No 216/2008 and its Implementing Rules, it shall, prior to implementing it, provide the competent authority with a full description of the alternative means of compliance. The description shall include any revisions to manuals or procedures that may be relevant, as well as an assessment demonstrating that the Implementing Rules are met.

The operator may implement these alternative means of compliance subject to prior approval by the competent authority and upon receipt of the notification as prescribed in [ARO.GEN.120\(d\)](#).

- (c) An operator required to declare its activity shall notify to the competent authority the list of alternative means of compliance it uses to establish compliance with Regulation (EC) No 216/2008 and its Implementing Rules.
- (d) When an operator subject to SPO authorisation wishes to use alternative means of compliance, it shall comply with (b) whenever such alternative means of compliance affects the standard operating procedures that are part of the authorisation and with (c) for the declared part of its organisation and operation.

AMC1 ORO.GEN.120(a) Means of compliance

ED Decision 2014/017/R

DEMONSTRATION OF COMPLIANCE

In order to demonstrate that the Implementing Rules are met, a risk assessment should be completed and documented. The result of this risk assessment should demonstrate that an equivalent level of safety to that established by the Acceptable Means of Compliance (AMC) adopted by the Agency is reached.

ORO.GEN.125 Terms of approval and privileges of an AOC holder

Regulation (EU) No 379/2014

A certified operator shall comply with the scope and privileges defined in the operations specifications attached to the operator's certificate.

AMC1 ORO.GEN.125 Terms of approval and privileges of an AOC holder

ED Decision 2014/017/R

MANAGEMENT SYSTEM DOCUMENTATION

The management system documentation should contain the privileges and detailed scope of activities for which the operator is certified, as relevant to the applicable requirements. The scope of activities defined in the management system documentation should be consistent with the terms of approval.

ORO.GEN.130 Changes related to an AOC holder

Regulation (EU) No 379/2014

- (a) Any change affecting:
 - (1) the scope of the certificate or the operations specifications of an operator; or
 - (2) any of the elements of the operator's management system as required in [ORO.GEN.200\(a\)\(1\) and \(a\)\(2\)](#),shall require prior approval by the competent authority.
- (b) For any changes requiring prior approval in accordance with Regulation (EC) No 216/2008 and its Implementing Rules, the operator shall apply for and obtain an approval issued by the competent authority. The application shall be submitted before any such change takes place, in order to enable the competent authority to determine continued compliance with Regulation (EC) No 216/2008 and its Implementing Rules and to amend, if necessary, the operator certificate and related terms of approval attached to it.

The operator shall provide the competent authority with any relevant documentation.

The change shall only be implemented upon receipt of formal approval by the competent authority in accordance with [ARO.GEN.330](#).

The operator shall operate under the conditions prescribed by the competent authority during such changes, as applicable.

- (c) All changes not requiring prior approval shall be managed and notified to the competent authority as defined in the procedure approved by the competent authority in accordance with [ARO.GEN.310\(c\)](#).

AMC1 ORO.GEN.130 Changes related to an AOC holder

ED Decision 2019/019/R

APPLICATION TIME FRAMES

- (a) The application for the amendment of an air operator certificate (AOC) should be submitted at least 30 days before the date of the intended changes.
- (b) In the case of a planned change of a nominated person in accordance with [ORO.GEN.210\(b\)](#) or of a safety manager as defined under [AMC1 ORO.GEN.200\(a\)\(1\)](#), the operator should inform the competent authority at least 20 days before the date of the proposed change.
- (c) Unforeseen changes should be notified at the earliest opportunity, in order to enable the competent authority to determine continued compliance with the applicable requirements and to amend, if necessary, the AOC and related terms of approval.

GM1 ORO.GEN.130(a) Changes related to an AOC holder

ED Decision 2017/007/R

GENERAL

- (a) Typical examples of changes that may affect the AOC or the operations specifications or the operator's management system, as required in [ORO.GEN.200\(a\)\(1\) and \(a\)\(2\)](#), are listed below:
 - (1) the name of the operator;
 - (2) a change of legal entity;
 - (3) the operator's principal place of business;
 - (4) the operator's scope of activities;
 - (5) additional locations of the operator;
 - (6) the accountable manager referred to in [ORO.GEN.210\(a\)](#);
 - (7) reporting lines between the accountable manager and the nominated person;
 - (8) the operator's documentation, as required by this Annex, safety policy and procedures;
 - (9) the facilities.
- (b) Prior approval by the competent authority is required for any changes to the operator's procedure describing how changes not requiring prior approval will be managed and notified to the competent authority.
- (c) Changes requiring prior approval may only be implemented upon receipt of formal approval by the competent authority.

GM2 ORO.GEN.130(a) Changes related to an AOC holder

ED Decision 2014/017/R

CHANGE OF NAME

A change of name requires the operator to submit a new application as a matter of urgency.

Where this is the only change to report, the new application can be accompanied by a copy of the documentation previously submitted to the competent authority under the previous name, as a means of demonstrating how the operator complies with the applicable requirements.

AMC1 ORO.GEN.130(b) Changes related to an AOC holder

ED Decision 2017/007/R

MANAGEMENT OF CHANGES REQUIRING PRIOR APPROVAL

For changes requiring prior approval, the operators should conduct a safety risk assessment and provide it to the competent authority upon request.

GM1 ORO.GEN.130(b) Changes related to an AOC holder

ED Decision 2022/012/R

CHANGES REQUIRING PRIOR APPROVAL

The following GM is a non-exhaustive checklist of items that require prior approval by the competent authority as specified in the applicable Implementing Rules:

- (a) alternative means of compliance;
- (b) procedures regarding items to be notified to the competent authority;
- (c) cabin crew:
 - (1) conduct of the training, examination and checking required by Annex V (Part-CC) to [Commission Regulation \(EU\) No 1178/2011](#)¹ and issue of cabin crew attestations;
 - (2) procedures for cabin crew to operate on four aircraft types;
 - (3) training programmes, including syllabi;
- (d) leasing agreements;
- (e) procedure for the use of aircraft included in an AOC by other operators for NCC, NCO and specialised operations, as required by [ORO.GEN.310](#);
- (f) specific approvals in accordance with Annex V (Part-SPA);
- (g) dangerous goods training programmes;
- (h) flight crew:
 - (1) alternative training and qualification programmes (ATQPs);
 - (2) procedures for flight crew to operate on more than one type or variant;
 - (3) training and checking programmes, including syllabi and use of flight simulation training devices (FSTDs);

¹ Commission Regulation (EU) No 1178/2011 of 3 November 2011 laying down technical requirements and administrative procedures related to civil aviation aircrew pursuant to Regulation (EC) No 216/2008 of the European Parliament and of the Council (OJ L 311, 25.11.2011, p. 1).

-
- (i) fuel schemes and special refuelling or defuelling of aeroplanes;
 - (j) helicopter operations:
 - (1) over a hostile environment located outside a congested area, unless the operator holds an approval to operate according to [Subpart J HELICOPTER EMERGENCY MEDICAL SERVICE OPERATIONS](#) of Annex V (Part-SPA);
 - (2) to/from a public interest site;
 - (3) without an assured safe forced landing capability; and
 - (4) during refuelling with rotors turning;
 - (k) mass and balance: standard masses for load items other than standard masses for passengers and checked baggage;
 - (l) minimum equipment list (MEL):
 - (1) MEL;
 - (2) operating other than in accordance with the MEL, but within the constraints of the master minimum equipment list (MMEL);
 - (3) rectification interval extension (RIE) procedures;
 - (m) minimum flight altitudes:
 - (1) the method for establishing minimum flight altitudes;
 - (2) descent procedures to fly below specified minimum altitudes;
 - (n) performance:
 - (1) increased bank angles at take-off (for performance class A aeroplanes);
 - (2) short landing operations (for performance class A and B aeroplanes);
 - (3) steep approach operations (for performance class A and B aeroplanes);
 - (4) reduced required landing distance operations (for performance class A and B aeroplanes);
 - (o) isolated aerodrome: using an isolated aerodrome as destination aerodrome for operations with aeroplanes;
 - (p) method used to establish aerodrome operating minima;
 - (q) approach flight technique:
 - (1) all approaches not flown as stabilised approaches for a particular approach to a particular runway;
 - (2) non-precision approaches not flown with the continuous descent final approach (CDFA) technique for each particular approach/runway combination;
 - (r) maximum distance from an adequate aerodrome for two-engined aeroplanes without an extended range operations with two-engined aeroplanes (ETOPS) approval:
 - (1) air operations with two-engined performance class A aeroplanes with a maximum operational passenger seating configuration (MOPSC) of 19 or less and a maximum take-off mass less than 45 360 kg, over a route that contains a point further than 120 minutes from an adequate aerodrome, under standard conditions in still air;

- (s) aircraft categories:
 - (1) Applying a lower landing mass than the maximum certified landing mass for determining the indicated airspeed at threshold (VAT).
- (t) commercial air transport operations with single-engined turbine aeroplanes in instrument meteorological conditions or at night (CAT SET-IMC).

ORO.GEN.135 Continued validity of an AOC

Regulation (EU) 2019/1384

- (a) The operator's certificate shall remain valid subject to all of the following:
 - (1) the operator remaining in compliance with the relevant requirements of Regulation (EU) 2018/1139 and its delegated and implementing acts, taking into account the provisions related to the handling of findings as specified under [ORO.GEN.150](#) of this Annex;
 - (2) the competent authority being granted access to the operator as defined in point [ORO.GEN.140](#) of this Annex to determine continued compliance with the relevant requirements of Regulation (EU) 2018/1139 and its delegated and implementing acts;
 - (3) the certificate not being surrendered or revoked.
- (b) Upon revocation or surrender the certificate shall be returned to the competent authority without delay.

ORO.GEN.140 Access

Regulation (EU) 2019/1384

- (a) For the purpose of determining compliance with the relevant requirements of Regulation (EU) 2018/1139 and its delegated and implementing acts, the operator shall grant access at any time to any facility, aircraft, document, records, data, procedures or any other material relevant to its activity subject to certification, SPO authorisation or declaration, whether it is contracted or not, to any person authorised by one of the following authorities:
 - (1) the competent authority defined in point [ORO.GEN.105](#) of Annex III to this Regulation;
 - (2) the authority acting under the provisions of points [ARO.GEN.300\(d\)](#), ARO.GEN.300(e) or Subpart ARO.RAMP of Annex II to this Regulation.
- (b) Access to the aircraft mentioned under (a) shall, in the case of CAT, include the possibility to enter and remain in the aircraft during flight operations unless otherwise decided by the commander for the flight crew compartment in accordance with [CAT.GEN.MPA.135](#) in the interest of safety.

ORO.GEN.150 Findings

Regulation (EU) No 965/2012

After receipt of notification of findings, the operator shall:

- (a) identify the root cause of the non-compliance;
- (b) define a corrective action plan; and
- (c) demonstrate corrective action implementation to the satisfaction of the competent authority within a period agreed with that authority as defined in [ARO.GEN.350\(d\)](#).

AMC1 ORO.GEN.150(b) Findings

ED Decision 2014/017/R

GENERAL

The corrective action plan defined by the operator should address the effects of the non-compliance, as well as its root cause.

GM1 ORO.GEN.150 Findings

ED Decision 2014/017/R

GENERAL

- (a) Preventive action is the action to eliminate the cause of a potential non-compliance or other undesirable potential situation.
- (b) Corrective action is the action to eliminate or mitigate the root cause(s) and prevent recurrence of an existing detected non-compliance or other undesirable condition or situation. Proper determination of the root cause is crucial for defining effective corrective actions to prevent reoccurrence.
- (c) Correction is the action to eliminate a detected non-compliance.

ORO.GEN.155 Immediate reaction to a safety problem

Regulation (EU) No 965/2012

The operator shall implement:

- (a) any safety measures mandated by the competent authority in accordance with [ARO.GEN.135\(c\)](#); and
- (b) any relevant mandatory safety information issued by the Agency, including airworthiness directives.

ORO.GEN.160 Occurrence reporting

Regulation (EU) 2019/1384

- (a) The operator shall report to the competent authority, and to any other organisation required to be informed by the State of the operator, any accident, serious incident and occurrence as defined in Regulation (EU) No 996/2010 of the European Parliament and of the Council¹ and Regulation (EU) No 376/2014.
- (b) Without prejudice to point (a) the operator shall report to the competent authority and to the organisation responsible for the design of the aircraft any incident, malfunction, technical defect, exceeding of technical limitations or occurrence that would highlight inaccurate, incomplete or ambiguous information contained in the operational suitability data established in accordance with Regulation (EU) No 748/2012 or other irregular circumstance that has or may have endangered the safe operation of the aircraft and that has not resulted in an accident or serious incident.
- (c) Without prejudice to Regulation (EU) No 996/2010 and Regulation (EU) No 376/2014, the reports referred in points (a) and (b) shall be made in a form and manner established by the

¹ Regulation (EU) No 996/2010 of the European Parliament and of the Council of 20 October 2010 on the investigation and prevention of accidents and incidents in civil aviation and repealing Directive 94/56/EC (OJ L 295, 12.11.2010, p. 35).

competent authority and shall contain all pertinent information about the conditions known to the operator.

- (d) Reports shall be made as soon as practicable, but in any case within 72 hours of the operator identifying the condition to which the report relates, unless exceptional circumstances prevent this.
- (e) Where relevant, the operator shall produce a follow-up report to provide details of actions it intends to take to prevent similar occurrences in the future, as soon as these actions have been identified. This report shall be produced in a form and manner established by the competent authority.

AMC1 ORO.GEN.160 Occurrence reporting

ED Decision 2019/019/R

GENERAL

- (a) The operator should report all occurrences defined in AMC 20-8, and as required by the applicable national rules implementing Regulation (EU) No 376/2014 on occurrence reporting in civil aviation.
- (b) In addition to the reports required by AMC 20-8 and Regulation (EU) No 376/2014, the operator should report volcanic ash clouds encountered during flight.

AMC2 ORO.GEN.160 Occurrence reporting

ED Decision 2016/019/R

REPORTABLE EVENTS OF PBN OPERATIONS

- (a) A reportable event should be an event that adversely affects the safety of the operation and may be caused by actions or events external to the functioning of the aircraft navigation system.
- (b) Technical defects and the exceedance of technical limitations, including:
 - (1) significant navigation errors attributed to incorrect data or a database coding error;
 - (2) unexpected deviations in lateral/vertical flight path not caused by flight crew input or erroneous operation of equipment;
 - (3) significant misleading information without a failure warning;
 - (4) total loss or multiple navigation equipment failure; and
 - (5) loss of integrity, e.g. RAIM function, whereas integrity was predicted to be available during preflight planning,should be considered a reportable event.
- (c) The operator should have in place a system for investigating a reportable event to determine if it is due to an improperly coded procedure or a navigation database error. The operator should initiate corrective actions for such an event.

AMC3 ORO.GEN.160 Occurrence reporting

ED Decision 2022/012/R

REPORTABLE EVENTS OF LVOs

- (a) A reportable event should include:
- (1) significant deviations from the flight path not caused by flight crew input;
 - (2) misleading information without flight deck alerts;
 - (3) loss of airborne navigation equipment functions necessary for the operation;
 - (4) loss of functions or facilities at the aerodrome necessary for the operation, including aerodrome operating procedures, ATC operation, navigation facilities, visual aids and electrical power supply;
 - (5) loss of other functions related to external infrastructure necessary for the operation; and
 - (6) any other event causing the approach or landing to be abandoned if occurring repeatedly.
- (b) The reports should be submitted to the aerodrome involved when relevant and in addition to the recipients prescribed in [ORO.GEN.160\(b\)](#).

GM1 ORO.GEN.160 Occurrence reporting

ED Decision 2022/012/R

REPORTABLE EVENTS OF LVOs — OTHER EVENTS OCCURRING REPEATEDLY

- (a) The purpose of point (a)(6) of [AMC3 ORO.GEN.160](#) is to share the information with aviation stakeholders other than the operator of the aircraft to identify yet unknown systematic safety-related issues. The main focus is thus on a series of similar events rather than an isolated single event.
- (b) Other events causing the approach or landing to be abandoned may include but are not limited to:
- (1) erroneous or inadequate flight crew action or aircraft handling; or
 - (2) meteorological phenomena or human-made disturbances (e.g. road crossing final approach in an EFVS approach, laser strikes, etc.) or emissions from infrastructures (e.g. 5G) which require flight crews to take corrective action to an extent to which the LVO cannot be terminated successfully or completed as planned, leading to a go-around, a balked landing or an unplanned manual intervention by the pilot during the landing manoeuvre.
- (c) Possible causes may be human-factor-related issues when employing newly introduced LVO equipment technologies or procedures or when changes take place in the runway environment or aerodrome vicinity.

SECTION 2 – MANAGEMENT

ORO.GEN.200 Management system

Regulation (EU) No 965/2012

- (a) The operator shall establish, implement and maintain a management system that includes:
- (1) clearly defined lines of responsibility and accountability throughout the operator, including a direct safety accountability of the accountable manager;
 - (2) a description of the overall philosophies and principles of the operator with regard to safety, referred to as the safety policy;
 - (3) the identification of aviation safety hazards entailed by the activities of the operator, their evaluation and the management of associated risks, including taking actions to mitigate the risk and verify their effectiveness;
 - (4) maintaining personnel trained and competent to perform their tasks;
 - (5) documentation of all management system key processes, including a process for making personnel aware of their responsibilities and the procedure for amending this documentation;
 - (6) a function to monitor compliance of the operator with the relevant requirements. Compliance monitoring shall include a feedback system of findings to the accountable manager to ensure effective implementation of corrective actions as necessary; and
 - (7) any additional requirements that are prescribed in the relevant Subparts of this Annex or other applicable Annexes.
- (b) The management system shall correspond to the size of the operator and the nature and complexity of its activities, taking into account the hazards and associated risks inherent in these activities.

AMC1 ORO.GEN.200(a)(1);(2);(3);(5) Management system

ED Decision 2017/007/R

NON-COMPLEX OPERATORS — GENERAL

- (a) Safety risk management may be performed using hazard checklists or similar risk management tools or processes, which are integrated into the activities of the operator.
- (b) The operator should manage safety risks related to a change. The management of change should be a documented process to identify external and internal change that may have an adverse effect on safety. It should make use of the operator's existing hazard identification, risk assessment and mitigation processes.
- (c) The operator should identify a person who fulfils the role of safety manager and who is responsible for coordinating the safety-management-related processes and tasks. This person may be the accountable manager or a person with an operational role within the operator.
- (d) Within the operator, responsibilities should be identified for hazard identification, risk assessment and mitigation.
- (e) The safety policy should include a commitment to improve towards the highest safety standards, comply with all applicable legal requirements, meet all applicable standards, consider best practices and provide appropriate resources.

- (f) The operator should, in cooperation with other stakeholders, develop, coordinate and maintain an emergency response plan (ERP) that ensures orderly and safe transition from normal to emergency operations and return to normal operations. The ERP should provide the actions to be taken by the operator or specified individuals in an emergency and reflect the size, nature and complexity of the activities performed by the operator.

AMC1 ORO.GEN.200(a)(1) Management system

ED Decision 2019/019/R

COMPLEX OPERATORS — ORGANISATION AND ACCOUNTABILITIES

The management system of an operator should encompass safety by including a safety manager and a safety review board in the organisational structure.

- (a) Safety manager
- (1) The safety manager should act as the focal point and be responsible for the development, administration and maintenance of an effective safety management system.
 - (2) The functions of the safety manager should be to:
 - (i) facilitate hazard identification, risk analysis and management;
 - (ii) monitor the implementation of actions taken to mitigate risks, as listed in the safety action plan;
 - (iii) provide periodic reports on safety performance;
 - (iv) ensure maintenance of safety management documentation;
 - (v) ensure that there is safety management training available and that it meets acceptable standards;
 - (vi) provide advice on safety matters; and
 - (vii) ensure initiation and follow-up of internal occurrence/accident investigations.
 - (3) If more than one person is designated for the safety management function, the accountable manager should identify the person who acts as the unique focal point (i.e. the 'safety manager').
- (b) Safety review board
- (1) The safety review board should be a high level committee that considers matters of strategic safety in support of the accountable manager's safety accountability.
 - (2) The board should be chaired by the accountable manager and be composed of heads of functional areas.
 - (3) The safety review board should monitor:
 - (i) safety performance against the safety policy and objectives;
 - (ii) that any safety action is taken in a timely manner; and
 - (iii) the effectiveness of the operator's safety management processes.
- (c) The safety review board should ensure that appropriate resources are allocated to achieve the established safety performance.

- (d) The safety manager or any other relevant person may attend, as appropriate, safety review board meetings. He/she may communicate to the accountable manager all information, as necessary, to allow decision making based on safety data.

GM1 ORO.GEN.200(a)(1) Management system

ED Decision 2019/019/R

SAFETY MANAGER

- (a) Depending on the size of the operator and the nature and complexity of its activities, the safety manager may be assisted by additional safety personnel for the performance of all safety management related tasks.
- (b) Regardless of the organisational set-up it is important that the safety manager remains the unique focal point as regards the development, administration and maintenance of the operator's safety management system.

COMPETENCIES OF THE SAFETY MANAGER

- (c) The safety manager as defined under [AMC1 ORO.GEN.200\(a\)\(1\)](#) is expected to support, facilitate and lead the implementation and maintenance of the safety management system, fostering an organisational culture for an effective safety management, risk management and occurrence reporting. The competencies for a safety manager should thus include, but not be limited to, the following:
- (1) Knowledge of:
 - (i) ICAO standards and European requirements and provisions on safety management;
 - (ii) basic safety investigation techniques; and
 - (iii) human factors in aviation.
 - (2) Relevant and documented work experience, preferably in a comparable position, in:
 - (i) management systems including compliance monitoring systems and safety management;
 - (ii) risk management; and
 - (iii) the operations of the organisation.
 - (3) Other suitable competencies
 - (i) the promotion of a positive safety culture;
 - (ii) interpersonal, influencing and leadership skills;
 - (iii) oral and written communication skills;
 - (iv) data management, analytical and problem-solving skills;
 - (v) professional integrity.

GM2 ORO.GEN.200(a)(1) Management system

ED Decision 2017/007/R

COMPLEX OPERATORS — SAFETY ACTION GROUP

- (a) A safety action group may be established as a standing group or as an ad-hoc group to assist or act on behalf of the safety review board.
- (b) More than one safety action group may be established depending on the scope of the task and specific expertise required.
- (c) The safety action group should report to and take strategic direction from the safety review board and should be comprised of managers, supervisors and personnel from operational areas.
- (d) The safety action group should:
 - (1) monitor operational safety;
 - (2) define actions to mitigate the identified safety risks;
 - (3) assess the impact on safety of operational changes; and
 - (4) ensure that safety actions are implemented within agreed timescales.
- (e) The safety action group should review the effectiveness of previous safety recommendations and safety promotion.

GM3 ORO.GEN.200(a)(1) Management system

ED Decision 2017/007/R

MEANING OF THE TERMS 'ACCOUNTABILITY' AND 'RESPONSIBILITY'

In the English language, the notion of accountability is different from the notion of responsibility. Whereas 'accountability' refers to an obligation which cannot be delegated, 'responsibility' refers to an obligation that can be delegated.

AMC1 ORO.GEN.200(a)(2) Management system

ED Decision 2014/017/R

COMPLEX OPERATORS — SAFETY POLICY

- (a) The safety policy should:
 - (1) be endorsed by the accountable manager;
 - (2) reflect organisational commitments regarding safety and its proactive and systematic management;
 - (3) be communicated, with visible endorsement, throughout the operator; and
 - (4) include safety reporting principles.
- (b) The safety policy should include a commitment:
 - (1) to improve towards the highest safety standards;
 - (2) to comply with all applicable legislation, meet all applicable standards and consider best practices;
 - (3) to provide appropriate resources;
 - (4) to enforce safety as one primary responsibility of all managers; and

- (5) not to blame someone for reporting something which would not have been otherwise detected.
- (c) Senior management should:
 - (1) continually promote the safety policy to all personnel and demonstrate their commitment to it;
 - (2) provide necessary human and financial resources for its implementation; and
 - (3) establish safety objectives and performance standards.

GM1 ORO.GEN.200(a)(2) Management system

ED Decision 2014/017/R

SAFETY POLICY

The safety policy is the means whereby the operator states its intention to maintain and, where practicable, improve safety levels in all its activities and to minimise its contribution to the risk of an aircraft accident as far as is reasonably practicable.

The safety policy should state that the purpose of safety reporting and internal investigations is to improve safety, not to apportion blame to individuals.

AMC1 ORO.GEN.200(a)(3) Management system

ED Decision 2014/017/R

COMPLEX OPERATORS — SAFETY RISK MANAGEMENT

- (a) Hazard identification processes
 - (1) Reactive and proactive schemes for hazard identification should be the formal means of collecting, recording, analysing, acting on and generating feedback about hazards and the associated risks that affect the safety of the operational activities of the operator.
 - (2) All reporting systems, including confidential reporting schemes, should include an effective feedback process.
- (b) Risk assessment and mitigation processes
 - (1) A formal risk management process should be developed and maintained that ensures analysis (in terms of likelihood and severity of occurrence), assessment (in terms of tolerability) and control (in terms of mitigation) of risks to an acceptable level.
 - (2) The levels of management who have the authority to make decisions regarding the tolerability of safety risks, in accordance with (b)(1), should be specified.
- (c) Internal safety investigation
 - (1) The scope of internal safety investigations should extend beyond the scope of occurrences required to be reported to the competent authority.
- (d) Safety performance monitoring and measurement
 - (1) Safety performance monitoring and measurement should be the process by which the safety performance of the operator is verified in comparison to the safety policy and objectives.

(2) This process should include:

- (i) safety reporting, addressing also the status of compliance with the applicable requirements;
- (ii) safety studies, that is, rather large analyses encompassing broad safety concerns;
- (iii) safety reviews including trends reviews, which would be conducted during introduction and deployment of new technologies, change or implementation of procedures, or in situations of structural change in operations;
- (iv) safety audits focussing on the integrity of the operator's management system, and periodically assessing the status of safety risk controls; and
- (v) safety surveys, examining particular elements or procedures of a specific operation, such as problem areas or bottlenecks in daily operations, perceptions and opinions of operational personnel and areas of dissent or confusion.

(e) The management of change

The operator should manage safety risks related to a change. The management of change should be a documented process to identify external and internal change that may have an adverse effect on safety. It should make use of the operator's existing hazard identification, risk assessment and mitigation processes.

(f) Continuous improvement

The operator should continuously seek to improve its safety performance. Continuous improvement should be achieved through:

- (1) proactive and reactive evaluations of facilities, equipment, documentation and procedures through safety audits and surveys;
- (2) proactive evaluation of individuals' performance to verify the fulfilment of their safety responsibilities; and
- (3) reactive evaluations in order to verify the effectiveness of the system for control and mitigation of risk.

(g) The emergency response plan (ERP)

- (1) An ERP should be established that provides the actions to be taken by the operator or specified individuals in an emergency. The ERP should reflect the size, nature and complexity of the activities performed by the operator.
- (2) The ERP should ensure:
 - (i) an orderly and safe transition from normal to emergency operations;
 - (ii) safe continuation of operations or return to normal operations as soon as practicable; and
 - (iii) coordination with the emergency response plans of other organisations, where appropriate.

GM1 ORO.GEN.200(a)(3) Management system

ED Decision 2017/007/R

INTERNAL SAFETY REPORTING SCHEME

- (a) The overall purpose of the internal safety reporting scheme is to use reported information to improve the level of the safety performance of the operator and not to attribute blame.
- (b) The objectives of the scheme are to:
 - (1) enable an assessment to be made of the safety implications of each relevant incident and accident, including previous similar occurrences, so that any necessary action can be initiated; and
 - (2) ensure that knowledge of relevant incidents and accidents is disseminated, so that other persons and operators may learn from them.
- (c) The scheme is an essential part of the overall monitoring function and it is complementary to the normal day-to-day procedures and 'control' systems and is not intended to duplicate or supersede any of them. The scheme is a tool to identify those instances where routine procedures have failed.
- (d) All occurrence reports judged reportable by the person submitting the report should be retained as the significance of such reports may only become obvious at a later date.

GM2 ORO.GEN.200(a)(3) Management system

ED Decision 2017/007/R

RISK MANAGEMENT OF FLIGHT OPERATIONS WITH KNOWN OR FORECAST VOLCANIC ASH CONTAMINATION

(a) Responsibilities

The operator is responsible for the safety of its operations, including within an area with known or forecast volcanic ash contamination.

The operator should complete this assessment of safety risks related to known or forecast volcanic ash contamination as part of its management system before initiating operations into airspace forecast to be or aerodromes/operating sites known to be contaminated with volcanic ash.

This process is intended to ensure the operator takes account of the likely accuracy and quality of the information sources it uses in its management system and to demonstrate its own competence and capability to interpret data from different sources in order to achieve the necessary level of data integrity reliably and correctly resolve any conflicts among data sources that may arise.

In order to decide whether or not to operate into airspace forecast to be or aerodromes/operating sites known to be contaminated with volcanic ash, the operator should make use of the safety risk assessment within its management system, as required by [ORO.GEN.200](#).

The operator's safety risk assessment should take into account all relevant data including data from the type certificate holders (TCHs) regarding the susceptibility of the aircraft they operate to volcanic cloud-related airworthiness effects, the nature and severity of these effects and the related pre-flight, in-flight and post-flight precautions to be observed by the operator.

The operator should ensure that personnel required to be familiar with the details of the safety risk assessments receives all relevant information (both pre-flight and in-flight) in order to be in a position to apply appropriate mitigation measures as specified by the safety risk assessments.

(b) Procedures

The operator should have documented procedures for the management of operations into airspace forecast to be or aerodromes/operating sites known to be contaminated with volcanic ash.

These procedures should ensure that, at all times, flight operations remain within the accepted safety boundaries as established through the management system allowing for any variations in information sources, equipment, operational experience or organisation. Procedures should include those for flight crew, flight planners, dispatchers, operations, continuing airworthiness personnel such that they are in a position to evaluate correctly the risk of flights into airspace forecast to be contaminated by volcanic ash and to plan accordingly.

Continuing airworthiness personnel should be provided with procedures allowing them to correctly assess the need for and to execute relevant continuing airworthiness interventions.

The operator should retain sufficient qualified and competent staff to generate well supported operational risk management decisions and ensure that its staff are appropriately trained and current. It is recommended that the operator make the necessary arrangements for its relevant staff to take up opportunities to be involved in volcanic ash exercises conducted in their areas of operation.

(c) Volcanic activity information and operator's potential response

Before and during operations, information valuable to the operator is generated by various volcano agencies worldwide. The operator's risk assessment and mitigating actions need to take account of, and respond appropriately to, the information likely to be available during each phase of the eruptive sequence from pre-eruption through to end of eruptive activity. It is nevertheless noted that eruptions rarely follow a deterministic pattern of behaviour. A typical operator's response may consist of the following:

(1) Pre-eruption

The operator should have in place a robust mechanism for ensuring that it is constantly vigilant for any alerts of pre-eruption volcanic activity relevant to its operations. The staff involved need to understand the threat to safe operations that such alerts represent.

An operator whose routes traverse large, active volcanic areas for which immediate International Airways Volcano Watch (IAVW) alerts may not be available, should define its strategy for capturing information about increased volcanic activity before pre-eruption alerts are generated. For example, an operator may combine elevated activity information with information concerning the profile and history of the volcano to determine an operating policy, which could include re-routing or restrictions at night. This would be useful when dealing with the 60% of volcanoes which are unmonitored.

Such an operator should also ensure that its crews are aware that they may be the first to observe an eruption and so need to be vigilant and ready to ensure that this information is made available for wider dissemination as quickly as possible.

(2) Start of an eruption

Given the likely uncertainty regarding the status of the eruption during the early stages of an event and regarding the associated volcanic cloud, the operator's procedures

should include a requirement for crews to initiate re-routes to avoid the affected airspace.

The operator should ensure that flights are planned to remain clear of the affected areas and that consideration is given to available aerodromes/operating sites and fuel requirements.

It is expected that the following initial actions will be taken by the operator:

- (i) determine if any aircraft in flight could be affected, alert the crew and provide advice on re-routing and available aerodromes/operating sites as required;
- (ii) alert management;
- (iii) for flight departures, brief flight crew and revise flight and fuel planning in accordance with the safety risk assessment;
- (iv) alert flight crew and operations staff to the need for increased monitoring of information (e.g. special air report (AIREP), volcanic activity report (VAR), significant weather information (SIGMET), NOTAMs and company messages);
- (v) initiate the gathering of all data relevant to determining the risk; and
- (vi) apply mitigations identified in the safety risk assessment.

(3) On-going eruption

As the eruptive event develops, the operator can expect the responsible Volcanic Ash Advisory Centre (VAAC) to provide volcanic ash advisory messages (VAA/VAGs) defining, as accurately as possible, the vertical and horizontal extent of areas and layers of volcanic clouds. As a minimum, the operator should monitor, and take account of, this VAAC information as well as of relevant SIGMETs and NOTAMs.

Other sources of information are likely to be available such as VAR/AIREPs, satellite imagery and a range of other information from State and commercial organisations. The operator should plan its operations in accordance with its safety risk assessment taking into account the information that it considers accurate and relevant from these additional sources.

The operator should carefully consider and resolve differences or conflicts among the information sources, notably between published information and observations (pilot reports, airborne measurements, etc.).

Given the dynamic nature of the volcanic hazards, the operator should ensure that the situation is monitored closely and operations adjusted to suit changing conditions.

The operator should be aware that the affected or danger areas may be established and presented in a different way than the one currently used in Europe, as described in EUR Doc 019-NAT Doc 006.

The operator should require reports from its crews concerning any encounters with volcanic emissions. These reports should be passed immediately to the appropriate air traffic services (ATS) unit and to the operator's competent authority.

For the purpose of flight planning, the operator should treat the horizontal and vertical limits of the temporary danger area (TDA) or airspace forecast to be contaminated by volcanic ash as applicable, to be overflowed as it would mountainous terrain, modified in accordance with its safety risk assessment. The operator should take account of the risk of cabin depressurisation or engine failure resulting in the inability to maintain level flight

above a volcanic cloud, especially when conducting ETOPS operations. Additionally, minimum equipment list (MEL) provisions should be considered in consultation with the TCHs.

Flying below volcanic ash contaminated airspace should be considered on a case-by-case basis. It should only be planned to reach or leave an aerodrome/operating site close to the boundary of this airspace or where the ash contamination is very high and stable. The establishment of Minimum Sector Altitude (MSA) and the availability of aerodromes/operating sites should be considered.

(d) Safety risk assessment

When directed specifically at the issue of intended flight into airspace forecast to be or aerodromes/operating sites known to be contaminated with volcanic ash, the process should involve the following:

(1) Identifying the hazards

The generic hazard, in the context of this document, is airspace forecast to be or aerodromes/operating sites known to be contaminated with volcanic ash, and whose characteristics are harmful to the airworthiness and operation of the aircraft.

This GM is referring to volcanic ash contamination since it is the most significant hazard for flight operations in the context of a volcanic eruption. Nevertheless, it might not be the only hazard and therefore the operator should consider additional hazards which could have an adverse effect on aircraft structure or passengers safety such as gases.

Within this generic hazard, the operator should develop its own list of specific hazards taking into account its specific aircraft, experience, knowledge and type of operation, and any other relevant data stemming from previous eruptions.

(2) Considering the severity and consequences of the hazard occurring (i.e. the nature and actual level of damage expected to be inflicted on the particular aircraft from exposure to that volcanic ash cloud).

(3) Evaluating the likelihood of encountering volcanic ash clouds with characteristics harmful to the safe operation of the aircraft.

For each specific hazard within the generic hazard, the likelihood of adverse consequences should be assessed, either qualitatively or quantitatively.

(4) Determining whether the consequent risk is acceptable and within the operator's risk performance criteria.

At this stage of the process, the safety risks should be classified as acceptable or unacceptable. The assessment of tolerability will be subjective, based on qualitative data and expert judgement, until specific quantitative data are available in respect of a range of parameters.

(5) Taking action to reduce the safety risk to a level that is acceptable to the operator's management.

Appropriate mitigation for each unacceptable risk identified should then be considered in order to reduce the risk to a level acceptable to the operator's management.

(e) Procedures to be considered when identifying possible mitigations actions

When conducting a volcanic ash safety risk assessment, the operator should consider the following non-exhaustive list of procedures and processes as mitigation:

(1) Type certificate holders

Obtaining advice from the TCHs and other engineering sources concerning operations in potentially contaminated airspace and/or aerodromes/operating sites contaminated by volcanic ash.

This advice should set out:

- (i) the features of the aircraft that are susceptible to airworthiness effects related to volcanic ash;
- (ii) the nature and severity of these effects;
- (iii) the effect of volcanic ash on operations to/from contaminated aerodromes/operating sites, including the effect on take-off and landing aircraft performance;
- (iv) the related pre-flight, in-flight and post-flight precautions to be observed by the operator including any necessary amendments to aircraft operating manuals, aircraft maintenance manuals, master minimum equipment list/dispatch deviation or equivalents; and
- (v) the recommended inspections associated with operations in volcanic ash potentially contaminated airspace and operations to/from volcanic ash contaminated aerodromes/operating sites; this may take the form of instructions for continuing airworthiness or other advice.

(2) Operator/contracted organisations' personnel

Definition of procedures for flight planning, operations, engineering and maintenance ensuring that:

- (i) personnel responsible for flight planning are in a position to evaluate correctly the risk of encountering volcanic ash contaminated airspace, or aerodromes/operating sites, and can plan accordingly;
- (ii) flight planning and operational procedures enable crews to avoid areas and aerodromes/operating sites with unacceptable volcanic ash contamination;
- (iii) flight crew are aware of the possible signs of entry into a volcanic ash cloud and execute the associated procedures;
- (iv) continuing airworthiness personnel are able to assess the need for and to execute any necessary maintenance or other required interventions; and
- (v) crews are provided with appropriate aircraft performance data when operating to/from aerodromes/operating sites contaminated with volcanic ash.

(3) Provision of enhanced flight watch

This should ensure:

- (i) close and continuous monitoring of VAA, VAR/AIREP, SIGMET, NOTAM, ASHTAM and other relevant information, and information from crews, concerning the volcanic ash cloud hazard;
- (ii) access to plots of the affected areas from SIGMETs, NOTAMs and relevant company information for crews and personnel responsible for the management and the supervision of the flight operations; and

- (iii) communication of the latest information to crews and personnel responsible for the management and the supervision of the flight operations in a timely fashion.
- (4) Flight planning

Flexibility of the process to allow re-planning at short notice should conditions change.
- (5) Departure, destination and alternate aerodromes

For the airspace to be traversed, or the aerodromes/operating sites in use, parameters to evaluate and take account of:

 - (i) the probability of contamination;
 - (ii) any additional aircraft performance requirements;
 - (iii) required maintenance considerations;
 - (iv) fuel requirements for re-routeing and extended holding.
- (6) Routing policy

Parameters to evaluate and take account of:

 - (i) the shortest period in and over the forecast contaminated area;
 - (ii) the hazards associated with flying over the contaminated area;
 - (iii) drift down and emergency descent considerations;
 - (iv) the policy for flying below the contaminated airspace and the associated hazards.
- (7) Diversion policy

Parameters to evaluate and take account of:

 - (i) maximum allowed distance from a suitable aerodrome/operating site;
 - (ii) availability of aerodromes/operating sites outside the forecast contaminated area;
 - (iii) diversion policy after an volcanic ash encounter.
- (8) Minimum equipment list (MEL)

Additional provisions in the MEL for dispatching aircraft with unserviceabilities that might affect the following non-exhaustive list of systems:

 - (i) air conditioning packs;
 - (ii) engine bleeds;
 - (iii) pressurisation system;
 - (iv) electrical power distribution system;
 - (v) air data system;
 - (vi) standby instruments;
 - (vii) navigation systems;
 - (viii) de-icing systems;
 - (ix) engine-driven generators;
 - (x) auxiliary power unit (APU);
 - (xi) airborne collision avoidance system (ACAS);

- (xii) terrain awareness warning system (TAWS);
 - (xiii) autoland systems;
 - (xiv) provision of crew oxygen;
 - (xv) supplemental oxygen for passengers.
- (9) Standard operating procedures
- Crew training to ensure they are familiar with normal and abnormal operating procedures and particularly any changes regarding but not limited to:
- (i) pre-flight planning;
 - (ii) in-flight monitoring of volcanic ash cloud affected areas and avoidance procedures;
 - (iii) diversion;
 - (iv) communications with ATC;
 - (v) in-flight monitoring of engine and systems potentially affected by volcanic ash cloud contamination;
 - (vi) recognition and detection of volcanic ash clouds and reporting procedures;
 - (vii) in-flight indications of a volcanic ash cloud encounter;
 - (viii) procedures to be followed if a volcanic ash cloud is encountered;
 - (ix) unreliable or erroneous airspeed;
 - (x) non-normal procedures for engines and systems potentially affected by volcanic ash cloud contamination;
 - (xi) engine-out and engine relight;
 - (xii) escape routes; and
 - (xiii) operations to/from aerodromes/operating sites contaminated with volcanic ash.
- (10) Provision for aircraft technical log
- This should ensure:
- (i) systematic entry in the aircraft technical log related to any actual or suspected volcanic ash encounter whether in-flight or at an aerodrome/operating site; and
 - (ii) checking, prior to flight, of the completion of maintenance actions related to an entry in the aircraft technical log for a volcanic ash cloud encounter on a previous flight.
- (11) Incident reporting
- Crew requirements for:
- (i) reporting an airborne volcanic ash cloud encounter (VAR);
 - (ii) post-flight volcanic ash cloud reporting (VAR);
 - (iii) reporting non-encounters in airspace forecast to be contaminated; and
 - (iv) filing a mandatory occurrence report in accordance with [ORO.GEN.160](#).

(12) Continuing airworthiness procedures

Procedures when operating in or near areas of volcanic ash cloud contamination:

- (i) enhancement of vigilance during inspections and regular maintenance and appropriate adjustments to maintenance practices;
- (ii) definition of a follow-up procedure when a volcanic ash cloud encounter has been reported or suspected;
- (iii) thorough investigation for any sign of unusual or accelerated abrasions or corrosion or of volcanic ash accumulation;
- (iv) reporting to TCHs and the relevant authorities observations and experiences from operations in areas of volcanic ash cloud contamination;
- (v) completion of any additional maintenance recommended by the TCH or by the Competent Authority.

(f) Reporting

The operator should ensure that reports are immediately submitted to the nearest ATS unit using the VAR/AIREP procedures followed up by a more detailed VAR on landing together with, as applicable, a report, as defined in Commission Regulation (EU) No 996/2010 and Regulation (EU) No 376/2014, and an aircraft technical log entry for:

- (1) any incident related to volcanic clouds;
- (2) any observation of volcanic ash activity; and
- (3) any time that volcanic ash is not encountered in an area where it was forecast to be.

(g) References

Further guidance on volcanic ash safety risk assessment is given in ICAO Doc. 9974 (Flight safety and volcanic ash — Risk management of flight operations with known or forecast volcanic ash contamination).

GM3 ORO.GEN.200(a)(3) Management system

ED Decision 2014/017/R

SAFETY RISK ASSESSMENT — RISK REGISTER

The results of the assessment of the potential adverse consequences or outcome of each hazard may be recorded by the operator in a risk register, an example of which is provided below.

Hazard		Incident Sequence Description	Existing Controls	Outcome (Pre-Mitigation)			Additional Mitigation required	Outcome (Post-Mitigation)			Actions and Owners	Monitoring and Review Requirements
No.	Description			Severity	Likelihood	Risk		Severity	Likelihood	Risk		

GM4 ORO.GEN.200(a)(3) Management system

ED Decision 2017/007/R

COMPLEX ORGANISATIONS — SAFETY RISK MANAGEMENT — INTERFACES BETWEEN ORGANISATIONS

- (a) Hazard identification and risk assessment start with an identification of all parties involved in the arrangement, including independent experts and non-approved organisations. It extends to the overall control structure, assessing, in particular, the following elements across all subcontract levels and all parties within such arrangements:
 - (1) coordination and interfaces between the different parties;
 - (2) applicable procedures;
 - (3) communication between all parties involved, including reporting and feedback channels;
 - (4) task allocation responsibilities and authorities; and
 - (5) qualifications and competency of key personnel.
- (b) Safety risk management focuses on the following aspects:
 - (1) clear assignment of accountability and allocation of responsibilities;
 - (2) only one party is responsible for a specific aspect of the arrangement — no overlapping or conflicting responsibilities, in order to eliminate coordination errors;
 - (3) existence of clear reporting lines, both for occurrence reporting and progress reporting;
 - (4) possibility for staff to directly notify the operator of any hazard suggesting an obviously unacceptable safety risk as a result of the potential consequences of this hazard.

AMC1 ORO.GEN.200(a)(4) Management system

ED Decision 2014/017/R

TRAINING AND COMMUNICATION ON SAFETY

- (a) Training
 - (1) All personnel should receive safety training as appropriate for their safety responsibilities.
 - (2) Adequate records of all safety training provided should be kept.
- (b) Communication
 - (1) The operator should establish communication about safety matters that:
 - (i) ensures that all personnel are aware of the safety management activities as appropriate for their safety responsibilities;
 - (ii) conveys safety critical information, especially relating to assessed risks and analysed hazards;
 - (iii) explains why particular actions are taken; and
 - (iv) explains why safety procedures are introduced or changed.
 - (2) Regular meetings with personnel where information, actions and procedures are discussed may be used to communicate safety matters.

GM1 ORO.GEN.200(a)(4) Management system

ED Decision 2014/017/R

TRAINING AND COMMUNICATION ON SAFETY

The safety training programme may consist of self-instruction via the media (newsletters, flight safety magazines), classroom training, e-learning or similar training provided by training service providers.

AMC1 ORO.GEN.200(a)(5) Management system

ED Decision 2014/017/R

MANAGEMENT SYSTEM DOCUMENTATION — GENERAL

- (a) The operator's management system documentation should at least include the following information:
 - (1) a statement signed by the accountable manager to confirm that the operator will continuously work in accordance with the applicable requirements and the operator's documentation, as required by this Annex;
 - (2) the operator's scope of activities;
 - (3) the titles and names of persons referred to in [ORO.GEN.210\(a\) and \(b\)](#);
 - (4) an operator chart showing the lines of responsibility between the persons referred to in [ORO.GEN.210](#);
 - (5) a general description and location of the facilities referred to in [ORO.GEN.215](#);
 - (6) procedures specifying how the operator ensures compliance with the applicable requirements;
 - (7) the amendment procedure for the operator's management system documentation.
- (b) The operator's management system documentation may be included in a separate manual or in (one of) the manual(s), as required by the applicable subpart(s). A cross-reference should be included.

AMC2 ORO.GEN.200(a)(5) Management system

ED Decision 2014/017/R

COMPLEX OPERATORS — SAFETY MANAGEMENT MANUAL

- (a) The safety management manual (SMM) should be the key instrument for communicating the approach to safety for the whole of the operator. The SMM should document all aspects of safety management, including the safety policy, objectives, procedures and individual safety responsibilities.
- (b) The contents of the safety management manual should include all of the following:
 - (1) scope of the safety management system;
 - (2) safety policy and objectives;
 - (3) safety accountability of the accountable manager;
 - (4) safety responsibilities of key safety personnel;
 - (5) documentation control procedures;
 - (6) hazard identification and risk management schemes;

- (7) safety action planning;
 - (8) safety performance monitoring;
 - (9) incident investigation and reporting;
 - (10) emergency response planning;
 - (11) management of change (including organisational changes with regard to safety responsibilities);
 - (12) safety promotion.
- (c) The SMM may be contained in (one of) the manual(s) of the operator.

GM1 ORO.GEN.200(a)(5) Management system

ED Decision 2017/007/R

MANAGEMENT SYSTEM DOCUMENTATION — GENERAL

- (a) It is not required to duplicate information in several manuals. The information may be contained in any of the operator manuals (e.g. operations manual), which may also be combined.
- (b) The operator may also choose to document some of the information required to be documented in separate documents (e.g. procedures). In this case, it should ensure that manuals contain adequate references to any document kept separately. Any such documents are then to be considered an integral part of the operator's management system documentation.

AMC1 ORO.GEN.200(a)(6) Management system

ED Decision 2019/019/R

COMPLIANCE MONITORING — GENERAL

- (a) Compliance monitoring

The implementation and use of a compliance monitoring function should enable the operator to monitor compliance with the relevant requirements of this Annex and other applicable Annexes.

 - (1) The operator should specify the basic structure of the compliance monitoring function applicable to the activities conducted.
 - (2) The compliance monitoring function should be structured according to the size of the operator and the complexity of the activities to be monitored.
- (b) Organisations should monitor compliance with the procedures they have designed to ensure safe activities. In doing so, they should as a minimum, and where appropriate, monitor compliance with the following:
 - (1) privileges of the operator;
 - (2) manuals, logs, and records;
 - (3) training standards;
 - (4) management system procedures and manuals;
 - (5) activities of the organisation carried out under the supervision of the nominated persons in accordance with [ORO.GEN.210\(b\)](#); and

-
- (6) any outsourced activities in accordance with [ORO.GEN.205](#), for compliance with the contract.
- (c) Organisational set up
- (1) To ensure that the operator continues to meet the requirements of this Part and other applicable Parts, the accountable manager should designate a compliance monitoring manager. The role of the compliance monitoring manager is to ensure that the activities of the operator are monitored for compliance with the applicable regulatory requirements, and any additional requirements as established by the operator, and that these activities are carried out properly under the supervision of the relevant head of functional area.
 - (2) The compliance monitoring manager should be responsible for ensuring that the compliance monitoring programme is properly implemented, maintained and continually reviewed and improved.
 - (3) The compliance monitoring manager should:
 - (i) have direct access to the accountable manager;
 - (ii) not be one of the other persons referred to in [ORO.GEN.210\(b\)](#);
 - (iii) be able to demonstrate relevant knowledge, background and appropriate experience related to the activities of the operator, including knowledge and experience in compliance monitoring; and
 - (iv) have access to all parts of the operator, and as necessary, any contracted operator.
 - (4) In the case of a non-complex operator, this task may be exercised by the accountable manager provided he/she has demonstrated having the related competence as defined in (c)(3)(iii).
 - (5) In the case the same person acts as compliance monitoring manager and as safety manager, the accountable manager, with regards to his/her direct accountability for safety, should ensure that sufficient resources are allocated to both functions, taking into account the size of the operator and the nature and complexity of its activities.
 - (6) The independence of the compliance monitoring function should be established by ensuring that audits and inspections are carried out by personnel not responsible for the function, procedure or products being audited.
 - (7) If more than one person is designated for the compliance monitoring function, the accountable manager should identify the person who acts as the unique focal point (i.e. the 'compliance monitoring manager').
- (d) Compliance monitoring documentation
- (1) Relevant documentation should include the relevant part(s) of the operator's management system documentation.
 - (2) In addition, relevant documentation should also include the following:
 - (i) terminology;
 - (ii) specified activity standards;
 - (iii) a description of the operator;
 - (iv) the allocation of duties and responsibilities;

- (v) procedures to ensure regulatory compliance;
 - (vi) the compliance monitoring programme, reflecting:
 - (A) schedule of the monitoring programme;
 - (B) audit procedures including an audit plan that is implemented, maintained, and continually reviewed and improved;
 - (C) reporting procedures;
 - (D) follow-up and corrective action procedures; and
 - (E) recording system.
 - (vii) the training syllabus referred to in (e)(2);
 - (viii) document control.
- (e) Training
- (1) Correct and thorough training is essential to optimise compliance in every operator. In order to achieve significant outcome of such training, the operator should ensure that all personnel understand the objectives as laid down in the operator's management system documentation.
 - (2) Those responsible for managing the compliance monitoring function should receive training on this task. Such training should cover the requirements of compliance monitoring, manuals and procedures related to the task, audit techniques, reporting and recording.
 - (3) Time should be provided to train all personnel involved in compliance management and for briefing the remainder of the personnel.
 - (4) The allocation of time and resources should be governed by the volume and complexity of the activities concerned.

GM1 ORO.GEN.200(a)(6) Management system

ED Decision 2014/017/R

COMPLIANCE MONITORING — GENERAL

- (a) The organisational set-up of the compliance monitoring function should reflect the size of the operator and the nature and complexity of its activities. The compliance monitoring manager may perform all audits and inspections himself/herself or appoint one or more auditors by choosing personnel having the related competence as defined in [AMC1 ORO.GEN.200\(a\)\(6\)](#) point (c)(3)(iii), either from, within or outside the operator.
- (b) Regardless of the option chosen it must be ensured that the independence of the audit function is not affected, in particular in cases where those performing the audit or inspection are also responsible for other functions for the operator.
- (c) In case external personnel are used to perform compliance audits or inspections:
 - (1) any such audits or inspections are performed under the responsibility of the compliance monitoring manager; and
 - (2) the operator remains responsible to ensure that the external personnel has relevant knowledge, background and experience as appropriate to the activities being audited or inspected; including knowledge and experience in compliance monitoring.

- (d) The operator retains the ultimate responsibility for the effectiveness of the compliance monitoring function, in particular for the effective implementation and follow-up of all corrective actions.

GM2 ORO.GEN.200(a)(6) Management system

ED Decision 2014/017/R

COMPLEX OPERATORS — COMPLIANCE MONITORING PROGRAMME

- (a) Typical subject areas for compliance monitoring audits and inspections for operators should be, as applicable:
- (1) actual flight operations;
 - (2) ground de-icing/anti-icing;
 - (3) flight support services;
 - (4) load control;
 - (5) technical standards.
- (b) Operators should monitor compliance with the operational procedures they have designed to ensure safe operations, airworthy aircraft and the serviceability of both operational and safety equipment. In doing so, they should, where appropriate, additionally monitor the following:
- (1) operational procedures;
 - (2) flight safety procedures;
 - (3) operational control and supervision;
 - (4) aircraft performance;
 - (5) all weather operations;
 - (6) communications and navigational equipment and practices;
 - (7) mass, balance and aircraft loading;
 - (8) instruments and safety equipment;
 - (9) ground operations;
 - (10) flight and duty time limitations, rest requirements, and scheduling;
 - (11) aircraft maintenance/operations interface;
 - (12) use of the MEL;
 - (13) flight crew;
 - (14) cabin crew;
 - (15) dangerous goods;
 - (16) security.

GM3 ORO.GEN.200(a)(6) Management system

ED Decision 2014/017/R

NON-COMPLEX OPERATORS — COMPLIANCE MONITORING

- (a) Compliance monitoring audits and inspections may be documented on a 'Compliance Monitoring Checklist', and any findings recorded in a 'Non-compliance Report'. The following documents may be used for this purpose.

COMPLIANCE MONITORING CHECKLIST			
Year:			
Subject	Date checked	Checked by	Comments/Non-compliance Report No.
Flight Operations			
Aircraft checklists checked for accuracy and validity			
Minimum five flight plans checked and verified for proper and correct information			
Flight planning facilities checked for updated manuals, documents and access to relevant flight information			
Incident reports evaluated and reported to the appropriate competent authority			
Ground Handling			
Contracts with ground handling organisations established and valid, if applicable			
Instructions regarding fuelling and de-icing issued, if applicable			
Instructions regarding dangerous goods issued and known by all relevant personnel, if applicable			
Mass & Balance			
Min. five load sheets checked and verified for proper and correct information, if applicable			
Aircraft fleet checked for valid weight check, if applicable			
Minimum one check per aircraft of correct loading and distribution, if applicable			
Training			
Training records updated and accurate			
All pilot licenses checked for currency, correct ratings and valid medical check			
All pilots received recurrent training			
Training facilities & Instructors approved			
All pilots received daily inspection (DI) training			
Documentation			
All issues of operations manual (OM) checked for correct amendment status			
AOC checked for validity and appropriate operations specifications, if applicable			

Aviation requirements applicable and updated			
Crew flight and duty time record updated, if applicable			
Flight documents record checked and updated			
Compliance monitoring records checked and updated

GM4 ORO.GEN.200(a)(6) Management system

ED Decision 2014/017/R

AUDIT AND INSPECTION

- (a) 'Audit' means a systematic, independent and documented process for obtaining evidence and evaluating it objectively to determine the extent to which requirements are complied with.
- (b) 'Inspection' means an independent documented conformity evaluation by observation and judgement accompanied as appropriate by measurement, testing or gauging, in order to verify compliance with applicable requirements.

AMC1 ORO.GEN.200(b) Management system

ED Decision 2017/004/R

SIZE, NATURE AND COMPLEXITY OF THE ACTIVITY

- (a) An operator should be considered as complex when it has a workforce of more than 20 full time equivalents (FTEs) involved in the activity subject to Regulation (EC) No 216/2008¹ and its Implementing Rules.
- (b) Operators with up to 20 FTEs involved in the activity subject to Regulation (EC) No 216/2008² and its Implementing Rules may also be considered complex based on an assessment of the following factors:
 - (1) in terms of complexity, the extent and scope of contracted activities subject to the approval;
 - (2) in terms of risk criteria, the extent of the following:
 - (i) operations requiring a specific approval;
 - (ii) high-risk commercial specialised operations;
 - (iii) operations with different types of aircraft used; and
 - (iv) operations in challenging environment (offshore, mountainous area, etc.).

ORO.GEN.205 Contracted activities

Regulation (EU) 2019/1384

- (a) When contracting or purchasing any services or products as a part of its activities, the operator shall ensure all of the following:
 - (1) that the contracted or purchased services or products comply with the applicable requirements;
 - (2) that any aviation safety hazards associated with contracted or purchased services or products are considered by the operator's management system.
- (b) When the certified operator or the SPO authorisation holder contracts any part of its activity to an organisation that is not itself certified or authorised in accordance with this Part to carry out

¹ Regulation (EC) No 216/2008 of the European Parliament and of the Council of 20 February 2008 on common rules in the field of civil aviation and establishing a European Aviation Safety Agency, and repealing Council Directive 91/670/EEC, Regulation (EC) No 1592/2002 and Directive 2004/36/EC. OJ L 79, 19.3.2008, p. 1.

² Regulation (EC) No 216/2008 of the European Parliament and of the Council of 20 February 2008 on common rules in the field of civil aviation and establishing a European Aviation Safety Agency, and repealing Council Directive 91/670/EEC, Regulation (EC) No 1592/2002 and Directive 2004/36/EC. OJ L 79, 19.3.2008, p. 1.

such activity, the contracted organisation shall work under the approval of the operator. The contracting organisation shall ensure that the competent authority is given access to the contracted organisation, to determine continued compliance with the applicable requirements.

AMC1 ORO.GEN.205 Contracted activities

ED Decision 2014/017/R

RESPONSIBILITY WHEN CONTRACTING ACTIVITIES

- (a) The operator may decide to contract certain activities to external organisations.
- (b) A written agreement should exist between the operator and the contracted organisation clearly defining the contracted activities and the applicable requirements.
- (c) The contracted safety-related activities relevant to the agreement should be included in the operator's safety management and compliance monitoring programmes.
- (d) The operator should ensure that the contracted organisation has the necessary authorisation or approval when required, and commands the resources and competence to undertake the task.

AMC2 ORO.GEN.205 Contracted activities

ED Decision 2019/019/R

THIRD-PARTY PROVIDERS

- (a) The initial audit and/or the continuous monitoring of contracted organisations may be performed by a third-party provider on behalf of the operator when it is demonstrated that:
 - (1) a documented arrangement has been established with the third-party provider;
 - (2) the audit standards applied by the third-party provider address the scope of this Regulation in sufficient detail;
 - (3) the third-party provider uses an evaluation system, designed to assess the operational, management and control systems of the contracted organisation;
 - (4) the independence of the third-party provider, its evaluation system as well as the impartiality of the auditors is ensured;
 - (5) the auditors are appropriately qualified and have sufficient knowledge, experience and training, including on-the-job training, to perform their allocated tasks;
 - (6) audits are performed on-site;
 - (7) access to the relevant data and facilities is granted to the level of detail necessary to verify compliance with the applicable requirements;
 - (8) access to the full audit report is granted;
 - (9) procedures have been established for monitoring continuous compliance of the contracted organisation with the applicable requirements; and
 - (10) procedures have been established to notify the contracted organisation of any non-compliance with the applicable requirements, the corrective actions to be taken, the follow-up of these corrective actions, and closure of findings.

- (b) The use of a third-party provider for the initial audit or the monitoring of continuous compliance of the contracted organisation does not exempt the operator from its responsibility under the applicable requirements.
- (c) The operator should maintain a list of the contracted organisations monitored by the third-party provider. This list and the full audit report prepared by the third-party provider should be made available to the competent authority upon request.

GM1 ORO.GEN.205 Contracted activities

ED Decision 2014/017/R

CONTRACTING — GENERAL

- (a) Operators may decide to contract certain activities to external organisations for the provision of services related to areas such as:
 - (1) ground de-icing/anti-icing;
 - (2) ground handling;
 - (3) flight support (including performance calculations, flight planning, navigation database and dispatch);
 - (4) training; and
 - (5) manual preparation.
- (b) Contracted activities include all activities within the operator's scope of approval that are performed by another organisation either itself certified or authorised to carry out such activity or if not certified or authorised, working under the operator's approval.
- (c) The ultimate responsibility for the product or service provided by external organisations should always remain with the operator.

GM2 ORO.GEN.205 Contracted activities

ED Decision 2014/017/R

RESPONSIBILITY WHEN CONTRACTING ACTIVITIES

- (a) Regardless of the approval status of the contracted organisation, the contracting operator is responsible for ensuring that all contracted activities are subject to hazard identification and risk management, as required by [ORO.GEN.200\(a\)\(3\)](#), and to compliance monitoring, as required by ORO.GEN.200(a)(6).
- (b) When the contracted organisation is itself certified or authorised to carry out the contracted activities, the operator's compliance monitoring should at least check that the approval effectively covers the contracted activities and that it is still valid.

ORO.GEN.210 Personnel requirements

Regulation (EU) No 965/2012

- (a) The operator shall appoint an accountable manager, who has the authority for ensuring that all activities can be financed and carried out in accordance with the applicable requirements. The accountable manager shall be responsible for establishing and maintaining an effective management system.

- (b) A person or group of persons shall be nominated by the operator, with the responsibility of ensuring that the operator remains in compliance with the applicable requirements. Such person(s) shall be ultimately responsible to the accountable manager.
- (c) The operator shall have sufficient qualified personnel for the planned tasks and activities to be performed in accordance with the applicable requirements.
- (d) The operator shall maintain appropriate experience, qualification and training records to show compliance with point (c).
- (e) The operator shall ensure that all personnel are aware of the rules and procedures relevant to the exercise of their duties.

AMC1 ORO.GEN.210(a) Application for an air operator certificate

ED Decision 2017/007/R

INFORMATION ON THE ACCOUNTABLE MANAGER

As part of being granted an air operator certificate (AOC), the operator should provide the competent authority with the following detailed information regarding the accountable manager:

- (a) name of the accountable manager;
- (b) position within the organisation;
- (c) information on means to ensure that all activities can be financed and carried out;
- (d) qualification relevant to the position; and
- (e) work experience relevant to the position.

GM1 ORO.GEN.210(a) Personnel requirements

ED Decision 2017/007/R

FUNCTION OF THE ACCOUNTABLE MANAGER

- (a) The accountable manager should have the overall responsibility for running the organisation.
- (b) When the accountable manager is not the chief executive officer, the competent authority should be assured that the accountable manager has direct access to the chief executive officer and has the necessary air operations funding allocation.

ORO.GEN.215 Facility requirements

Regulation (EU) No 965/2012

The operator shall have facilities allowing the performance and management of all planned tasks and activities in accordance with the applicable requirements.

ORO.GEN.220 Record-keeping

Regulation (EU) No 965/2012

- (a) The operator shall establish a system of record-keeping that allows adequate storage and reliable traceability of all activities developed, covering in particular all the elements indicated in [ORO.GEN.200](#).
- (b) The format of the records shall be specified in the operator's procedures.
- (c) Records shall be stored in a manner that ensures protection from damage, alteration and theft.

AMC1 ORO.GEN.220(b) Record-keeping

ED Decision 2014/017/R

GENERAL

- (a) The record-keeping system should ensure that all records are accessible whenever needed within a reasonable time. These records should be organised in a way that ensures traceability and retrievability throughout the required retention period.
- (b) Records should be kept in paper form or in electronic format or a combination of both. Records stored on microfilm or optical disc format are also acceptable. The records should remain legible throughout the required retention period. The retention period starts when the record has been created or last amended.
- (c) Paper systems should use robust material which can withstand normal handling and filing. Computer systems should have at least one backup system which should be updated within 24 hours of any new entry. Computer systems should include safeguards against the ability of unauthorised personnel to alter the data.
- (d) All computer hardware used to ensure data backup should be stored in a different location from that containing the working data and in an environment that ensures they remain in good condition. When hardware or software changes take place, special care should be taken that all necessary data continues to be accessible at least through the full period specified in the relevant subpart. In the absence of such indication, all records should be kept for a minimum period of 5 years.

GM1 ORO.GEN.220(b) Record-keeping

ED Decision 2014/017/R

RECORDS

Microfilming or optical storage of records may be carried out at any time. The records should be as legible as the original record and remain so for the required retention period.

SECTION 3 – ADDITIONAL ORGANISATIONAL REQUIREMENTS**ORO.GEN.310 Use of aircraft listed on an AOC for non-commercial operations and specialised operations**

Regulation (EU) 2019/1387

- (a) Aircraft listed on an operator's AOC may remain on the AOC if it is operated in any of the following situations:
 - (1) by the AOC holder itself, for specialised operations in accordance with Annex VIII (Part-SPO);
 - (2) by other operators, for non-commercial operations with motor-powered aircraft or for specialised operations performed in accordance with Annex VI (Part-NCC), Annex VII (Part-NCO) or Annex VIII (Part-SPO), provided that the aircraft is used for a continuous period not exceeding 30 days.
- (b) When the aircraft is used in accordance with point (a)(2), the AOC holder providing the aircraft and the operator using the aircraft shall establish a procedure:

- (1) clearly identifying which operator is responsible for the operational control of each flight and to describe how the operational control is transferred between them;
- (2) describing the handover procedure of the aircraft upon its return to the AOC holder.

That procedure shall be included in the operations manual of each operator or in a contract between the AOC holder and the operator using the aircraft in accordance with point (a)(2). The AOC holder shall establish a template of such contract. Point [ORO.GEN.220](#) shall apply to the record-keeping of those contracts.

The AOC holder and the operator using the aircraft in accordance with point (a)(2) shall ensure that the procedure is communicated to the relevant personnel.

- (c) The AOC holder shall submit to the competent authority the procedure referred to in point (b) for prior approval. The AOC holder shall agree with the competent authority on the means and on the frequency of providing it with information about transfers of operational control in accordance with point [ORO.GEN.130\(c\)](#).
- (d) The continuing airworthiness of the aircraft used in accordance with point (a) shall be managed by the organisation responsible for the continuing airworthiness of the aircraft included in the AOC, in accordance with Regulation (EU) No 1321/2014.
- (e) The AOC holder providing the aircraft in accordance with point (a) shall:
 - (1) indicate in its operations manual the registration marks of the provided aircraft and the type of operations conducted with those aircraft;
 - (2) remain informed at all times and keep record of each operator that holds the operational control of the aircraft at any given moment until the aircraft is returned to the AOC holder;
 - (3) ensure that its hazard identification, risk assessment and mitigation measures address all the operations conducted with those aircraft.
- (f) For operations under Annex VI (Part-NCC) and Annex VIII (Part-SPO), the operator using the aircraft in accordance with point (a) shall ensure all of the following:
 - (1) that every flight conducted under its operational control is recorded in the aircraft technical log system;
 - (2) that no changes to the aircraft systems or configuration are made;
 - (3) that any defect or technical malfunction occurring while the aircraft is under its operational control is reported to the organisation referred to in point (d);
 - (4) that the AOC holder receives a copy of any occurrence report related to the flights performed with the aircraft, completed in accordance with Regulation (EU) No 376/2014 and Commission Implementing Regulation (EU) 2015/1018¹.

¹ Commission Implementing Regulation (EU) 2015/1018 of 29 June 2015 laying down a list classifying occurrences in civil aviation to be mandatorily reported according to Regulation (EU) No 376/2014 of the European Parliament and of the Council (OJ L 163, 30.6.2015, p. 1).

GM1 ORO.GEN.310 Use of aircraft listed on an AOC for non-commercial operations and specialised operations

ED Decision 2019/019/R

EXAMPLES OF POSSIBLE SCENARIOS FOR THE USE OF AIRCRAFT LISTED ON AN AOC

‘Aircraft listed on an AOC’ means any aircraft included in the AOC certification process, to which the privileges of the AOC apply. The registration marks of these aircraft are indicated either in the operations specifications form or in the operations manual of the AOC holder.

The following examples provide possible scenarios with organisations and operators to which this rule applies:

- (a) The same AOC holder providing the aircraft, using the aircraft either:
 - (1) as a declared operator for SPO (commercial or non-commercial, including high-risk SPO) in accordance with Part-ORO and Part-SPO for operations with complex motor-powered aircraft. In such a case, the provisions of Part-SPO and Part-ORO apply. This implies that the operator submits a declaration for its SPO activities and applies for an authorisation if it performs high-risk SPO; or
 - (2) as a training organisation (approved training organisation (ATO) or declared training organisation (DTO)) for operations performed in accordance with Part-NCC or Part-NCO.
- (b) Another AOC holder:
 - (1) as a declared operator, using complex motor-powered aircraft for NCC operations in accordance with Part-ORO and Part-NCC or for SPO activities (commercial or non-commercial), including high-risk SPO in accordance with Part-ORO and Part-SPO;
 - (2) as a training organisation (ATO or DTO), using the aircraft for operations performed in accordance with Part-NCC or Part-NCO; or
 - (3) using other than complex motor-powered aircraft for NCO operations.
- (c) An NCC operator or a SPO operator, for operations performed in accordance with Part-ORO and Part-NCC or in accordance with Part-ORO and Part-SPO (commercial or non-commercial), including high-risk SPO.
- (d) An NCO operator or a SPO operator conducting non-commercial operations with other than complex motor-powered aircraft in accordance with Part-NCO.
- (e) A training organisation (ATO or DTO), commercial or non-commercial, conducting operations in accordance with Part-NCC or Part-NCO.

GM2 ORO.GEN.310 Use of aircraft listed on an AOC for non-commercial operations and specialised operations

ED Decision 2019/019/R

SPECIFIC APPROVALS

- (a) *Specific approvals (SPA) of the AOC holder using its aircraft for non-commercial operations and specialised operations*
 - (1) When the AOC holder performs operations in accordance with Part-NCC or Part-NCO, the SPA granted for the AOC extend over these operations, as in such cases the provisions of [ORO.AOC.125](#) apply.

- (2) When the AOC holder performs operations in accordance with Part-SPO, as a declared operator, either:
- (i) the SPA applicable to its SPO activities for the same aircraft are already granted within its AOC. In this case, the operator does not need to apply for them again; or
 - (ii) the SPA applicable to its SPO activities for the same aircraft are partially different from the SPA already granted within its AOC. In this case, the specific approval will cover all the different aspects involved in SPO operation or training of relevant personnel; or
 - (iii) the SPA are not granted within its AOC. In this case, the operator applies for the relevant SPA to its competent authority, in accordance with Part-SPA. This means that all the elements required for a SPA will be provided to the competent authority: evidence of the relevant airworthiness approval, specific equipment approval, operational procedures, and training programme specific for each of the SPA applied for.
- (b) *SPA of any other operator, regardless of whether it also holds an AOC, using the aircraft as a declared operator or as a(n) ATO/DTO*
- The declared operator performing NCC operations or SPO or the ATO/DTO has to comply with Part-SPA and apply for the SPA required for the type of operation it intends to conduct with that aircraft.

MINIMUM EQUIPMENT LIST (MEL)

The operator that uses the aircraft listed on the AOC of another operator is still responsible for obtaining the approval of the MEL for its own operations, to cover all the aircraft that it operates.

GM1 ORO.GEN.310(a)(2) Use of aircraft listed on an AOC for non-commercial operations and specialised operations

ED Decision 2019/019/R

EXCEEDING 30 DAYS OF CONTINUOUS OPERATION

When the other operator uses or intends to use the aircraft without returning it to the AOC holder for a duration that exceeds 30 days, then the provisions of [ORO.GEN.310](#) no longer apply; instead, the provisions of [ORO.AOC.110](#) apply and the AOC holder has to remove that aircraft from its AOC.

AMC1 ORO.GEN.310(b);(e) Use of aircraft listed on an AOC for non-commercial operations and specialised operations

ED Decision 2019/019/R

RESPONSIBILITIES OF THE AOC HOLDER

- (a) The AOC holder providing the aircraft should include the following information in the respective parts of its operations manual:
- (1) how the relevant personnel are informed about which of the operators is responsible for the operational control of each flight;
 - (2) when possible, which of the aircraft are used by the AOC holder itself, when conducting operations as a different operator (SPO operator, ATO or DTO), or by other operators;

- (3) when possible, the name of the other operators using the aircraft for operations performed in accordance with [ORO.GEN.310](#);
 - (4) when possible, the frequency with which the aircraft is used by the other operators;
 - (5) the means of instructing the relevant personnel on the continuing airworthiness procedure covering the use of the aircraft by other operators; and
 - (6) a customised list of occurrences that the other operators have to report to the AOC holder when using the aircraft in accordance with [ORO.GEN.310](#). This list may be adjusted to fit the aircraft used by the other operators, as well as the type of operation for which it is used. The AOC holder should communicate this list to the other operators.
- (b) The AOC holder should ensure that the operations specifications form of the respective aircraft is not carried on board when that aircraft is used by other operators for their NCC, NCO or SPO operations.

GM1 ORO.GEN.310(d) Use of aircraft listed on an AOC for non-commercial operations and specialised operations

ED Decision 2019/019/R

CONTINUING AIRWORTHINESS MANAGEMENT

In accordance with Annex I (Part-M) and Annex Vb (Part-ML) to Regulation (EU) No 1321/2014, the management of the continuing airworthiness of the aircraft by the continuing airworthiness management organisation (CAMO) or the combined airworthiness organisation (CAO) of the AOC holder means that the other operator has established a written contract as per Appendix I to Part-M or Appendix I to Part-ML with this CAMO or CAO.

AMC1 ORO.GEN.310(b);(d);(f) Use of aircraft listed on an AOC for non-commercial operations and specialised operations

ED Decision 2019/019/R

RESPONSIBILITIES OF THE OTHER OPERATOR

The other operator using the aircraft listed on an AOC for operations under [ORO.GEN.310](#) should include the following elements in its procedure:

- (a) a description of the way in which the shifting of operational control is communicated, including how, when and to whom the information is communicated;
- (b) a description of the specific responsibilities resulting from having the operational control of the flight performed with the aircraft listed on the AOC;
- (c) a description of the means to ensure that the relevant personnel are instructed to:
 - (1) contact the organisation responsible for the management of continuing airworthiness of the aircraft of the AOC holder (CAMO or CAO) for any defect or technical malfunction which occurs before or during the operation.

The information about any defect or malfunction should be transmitted to the CAMO or CAO of the AOC holder before the aircraft is used for the next flight. The same information should be confirmed by the entries in the aircraft technical log system; and
 - (2) report any occurrence in accordance with the applicable rules and the internal procedures; and

- (d) a customised list of occurrences, as developed by the AOC holder, which the other operator should use when informing the AOC holder of any safety-relevant issue or event that occurred while the aircraft was under its operational control.

SUBPART AOC: AIR OPERATOR CERTIFICATION

ORO.AOC.100 Application for an air operator certificate

Regulation (EU) 2015/1329

- (a) Without prejudice to Regulation (EC) No 1008/2008 of the European Parliament and the Council¹, prior to commencing commercial air transport operations, the operator shall apply for and obtain an air operator certificate (AOC) issued by the competent authority.
- (b) The operator shall provide the following information to the competent authority:
 - (1) the official name and business name, address, and mailing address of the applicant;
 - (2) a description of the proposed operation, including the type(s), and number of aircraft to be operated;
 - (3) a description of the management system, including organisational structure;
 - (4) the name of the accountable manager;
 - (5) the names of the nominated persons required by [ORO.AOC.135\(a\)](#) together with their qualifications and experience;
 - (6) a copy of the operations manual required by [ORO.MLR.100](#);
 - (7) a statement that all the documentation sent to the competent authority have been verified by the applicant and found in compliance with the applicable requirements.
- (c) Applicants shall demonstrate to the competent authority that:
 - (1) they comply with all the requirements of annex IV to Regulation (EC) No 216/2008, this Annex (Part-ORO), Annex IV (Part-CAT) and Annex V (Part-SPA) to this Regulation and Annex I (Part 26) to Regulation (EU) 2015/640²;
 - (2) all aircraft operated have a certificate of airworthiness (CofA) in accordance with Regulation (EU) No 748/2012 or are dry-leased in accordance with [ORO.AOC.110\(d\)](#); and
 - (3) its organisation and management are suitable and properly matched to the scale and scope of the operation.

AMC1 ORO.AOC.100 Application for an AOC

ED Decision 2014/017/R

APPLICATION TIME FRAMES

The application for the initial issue of an AOC should be submitted at least 90 days before the intended start date of operation. The operations manual may be submitted later, but in any case not later than 60 days before the intended start date of operation.

¹ OJ L 293, 31.10.2008, p. 3.

² Commission Regulation (EU) 2015/640 of 23 April 2015 on additional airworthiness specifications for a given type of operations and amending Regulation (EU) No 965/2012 (OJ L 106, 24.4.2015, p. 18).

AMC1 ORO.AOC.100(a) Application for an air operator certificate

ED Decision 2015/005/R

OPERATOR SECURITY PROGRAMME

In accordance with Regulation (EC) No 300/2008, as part of granting the AOC, the CAT operator should provide the competent authority with the operator's security programme, including security training. The security programme should be adapted to the type and area of operation, as well as to the aircraft operated.

GM1 ORO.AOC.100(c) Application for an air operator certificate

ED Decision 2017/007/R

MEANING OF CERTIFICATE OF AIRWORTHINESS

A certificate of airworthiness means either a certificate of airworthiness issued in accordance with Part-21.B.326 or a restricted certificate of airworthiness issued in accordance with Part-21.B.327.

ORO.AOC.105 Operations specifications and privileges of an AOC holder

Regulation (EU) No 965/2012

The privileges of the operator, including those granted in accordance with Annex V (Part-SPA), shall be specified in the operations specifications of the certificate.

ORO.AOC.110 Leasing agreement

Regulation (EU) 2019/1384

Any lease-in

- (a) Without prejudice to Regulation (EC) No 1008/2008, any lease agreement concerning aircraft used by an operator certified in accordance with this Part shall be subject to prior approval by the competent authority.
- (b) The operator certified in accordance with this Part shall not lease-in aircraft included in the list of operators subject to operational restrictions, registered in a State of which all operators under its oversight are subject to an operating ban or from an operator that is subject to an operating ban pursuant to Regulation (EC) No 2111/2005.

Wet lease-in

- (c) The applicant for the approval of the wet lease-in of an aircraft from a third-country operator shall demonstrate to the competent authority all of the following:
 - (1) that the third country operator holds a valid AOC issued in accordance with Annex 6 to the Convention on International Civil Aviation;
 - (2) that the safety standards of the third country operator with regard to continuing airworthiness and air operations are equivalent to the applicable requirements established by Regulation (EU) No 1321/2014 and this Regulation;
 - (3) that the aircraft has a standard CofA issued in accordance with Annex 8 to the Convention on International Civil Aviation.

Dry lease-in

- (d) An applicant for the approval of the dry lease-in of an aircraft registered in a third country shall demonstrate to the competent authority that:
- (1) an operational need has been identified that cannot be satisfied through leasing an aircraft registered in the EU;
 - (2) the duration of the dry lease-in does not exceed seven months in any 12 consecutive month period;
 - (3) compliance with the applicable requirements of Regulation (EU) No 1321/2014 is ensured; and
 - (4) the aircraft is equipped in accordance with the EU regulations for Air Operations.

Dry lease-out

- (e) The operator certified in accordance with this Part intending to dry lease-out one of its aircraft shall apply for prior approval by the competent authority. The application shall be accompanied by copies of the intended lease agreement or description of the lease provisions, except financial arrangements, and all other relevant documentation.

Wet lease-out

- (f) Prior to the wet lease-out of an aircraft, the operator certified in accordance with this Part shall notify the competent authority.

AMC1 ORO.AOC.110 Leasing agreement

ED Decision 2019/019/R

GENERAL

- (a) The operator intending to lease-in an aircraft should provide the competent authority with the following information:
- (1) the aircraft type, registration markings and serial number, as soon as available;
 - (2) the name and address of the registered owner;
 - (3) a copy of the valid certificate of airworthiness;
 - (4) a copy of the lease agreement or description of the lease provisions, except financial arrangements; and
 - (5) duration of the lease.
- (b) In case of wet lease-in, a copy of the AOC of the third-country operator and the areas of operation.
- (c) The information mentioned above should be accompanied by a statement signed by the lessee that the parties to the lease agreement fully understand their respective responsibilities under the applicable regulations.

AMC1 ORO.AOC.110(c) Leasing agreement

ED Decision 2019/019/R

WET LEASE-IN AGREEMENT WITH A THIRD-COUNTRY OPERATOR

If the operator is not intending to apply EU safety requirements for air operations and continuing airworthiness when wet leasing-in an aircraft registered in a third country, it should demonstrate to the competent authority that the standards complied with are equivalent to the following requirements:

- (a) Annex IV (Part-CAT);
- (b) Part-ORO:
 - (1) [ORO.GEN.110](#) and Section 2 of Subpart GEN;
 - (2) ORO.MLR, excluding [ORO.MLR.105](#);
 - (3) ORO.FC;
 - (4) ORO.CC, excluding [ORO.CC.200](#) and [ORO.CC.210\(a\)](#);
 - (5) ORO.TC;
 - (6) ORO.FTL, including related CS-FTL; and
 - (7) ORO.SEC;
- (c) Annex V (Part-SPA), if applicable;
- (d) for continuing airworthiness management of the third-country operator, Part-M¹ Subpart-B, Subpart-C and Subpart-G, excluding M.A.707, and M.A.710;
- (e) for the maintenance organisation used by the third-country operator during the lease period: Part-145²;
- (f) retroactive airworthiness requirements in accordance with Part-26; and
- (g) the operator should provide the competent authority with a full description of the flight time limitation scheme(s), operating procedures and safety assessment demonstrating compliance with the safety objectives set out in points (b)(1)-(6).

AMC2 ORO.AOC.110(c) Leasing agreement

ED Decision 2014/017/R

WET LEASE-IN

The lessee should maintain a record of occasions when lessors are used, for inspection by the State that issued its AOC.

¹ Commission Regulation (EC) No 2042/2003 of 20 November 2003 on the continuing airworthiness of aircraft and aeronautical products, parts and appliances, and on the approval of organisations and personnel involved in these tasks (OJ L 315, 28.11.2003, p. 1). Regulation as last amended by Commission Regulation (EU) No 1149/2011 of 21 October 2011 (OJ L 298, 16.11.2011, p. 1).

² Commission Regulation (EC) No 2042/2003 of 20 November 2003 on the continuing airworthiness of aircraft and aeronautical products, parts and appliances, and on the approval of organisations and personnel involved in these tasks (OJ L 315, 28.11.2003, p. 1). Regulation as last amended by Commission Regulation (EU) No 1149/2011 of 21 October 2011 (OJ L 298, 16.11.2011, p. 1).

GM1 ORO.AOC.110(c) Leasing agreement

ED Decision 2019/019/R

SHORT-TERM WET LEASE-IN WITH A THIRD-COUNTRY OPERATOR

In anticipation of an operational need the operator may enter into a framework agreement with more than one third-country operator provided that these operators comply with [ORO.AOC.110\(c\)](#). These third-country operators should be placed in a list maintained by the lessee.

AMC1 ORO.AOC.110(f) Leasing agreement

ED Decision 2014/017/R

WET LEASE-OUT

When notifying the competent authority, the operator intending to wet lease-out an aircraft should provide the competent authority with the following information:

- (a) the aircraft type, registration markings and serial number;
- (b) the name and address of the lessee;
- (c) a copy of the lease agreement or description of the lease provisions, except financial arrangements; and
- (d) the duration of the lease agreement.

ORO.AOC.115 Code-share agreements

Regulation (EU) No 965/2012

- (a) Without prejudice to applicable EU safety requirements for third country operators and aircraft, an operator certified in accordance with this Part shall enter into a code-share agreement with a third country operator only after:
 - (1) having verified that the third country operator complies with the applicable ICAO standards; and
 - (2) having provided the competent authority with documented information enabling such authority to comply with [ARO.OPS.105](#).
- (b) When implementing the code-share agreement the operator shall monitor and regularly assess the ongoing compliance of the third country operator with the applicable ICAO standards.
- (c) The operator certified in accordance with this Part shall not sell and issue tickets for a flight operated by a third country operator when the third country operator is subject to an operating ban pursuant to Regulation (EC) No 2111/2005 or is failing to maintain compliance with the applicable ICAO standards.

AMC1 ORO.AOC.115(a)(1) Code share agreements

ED Decision 2014/017/R

INITIAL VERIFICATION OF COMPLIANCE

- (a) In order to verify the third country operator's compliance with the applicable ICAO standards, in particular ICAO Annexes 1, 2, 6, Part I and III, as applicable, 8 and 18, the EU operator should conduct an audit of the third country operator, including interviews of personnel and inspections carried out at the third country operator's facilities.
- (b) The audit should focus on the operational, management and control systems of the operator.

AMC1 ORO.AOC.115(b) Code-share arrangements

ED Decision 2014/017/R

CODE-SHARE AUDIT PROGRAMME

- (a) Operators should establish a code-share audit programme for monitoring continuous compliance of the third country operator with the applicable ICAO standards. Such a code-share audit programme should include:
 - (1) the audit methodology (audit report + compliance statements);
 - (2) details of the specific operational areas to audit;
 - (3) criteria for defining satisfactory audit results;
 - (4) a system for reporting and correcting findings;
 - (5) a continuous monitoring system;
 - (6) auditor qualification and authorisation; and
 - (7) the frequency of audits.
- (b) The third country code-share operator should be audited at periods not exceeding 24 months. The beginning of the first 24-month oversight planning cycle is determined by the date of the first audit and should then determine the start and end dates of the recurrent 24-month planning cycle. The interval between two audits should not exceed 24 months.
- (c) The EU operator should ensure a renewal audit of each third country code-share operator prior to the audit expiry date of the previous audit. The audit expiry date for the previous audit becomes the audit effective date for the renewal audit provided the closing meeting for the renewal audit is within 150 days prior to the audit expiry date for the previous audit. If the closing meeting for the renewal audit is more than 150 days prior to the audit expiry date from the previous audit, then the audit effective date for the renewal audit is the day of the closing meeting of the renewal audit. Renewal audits are valid for 24 consecutive months beginning with the audit effective date and ending with the audit expiry date.
- (d) A code-share audit could be shared by several operators. In case of a shared audit, the report should be made available for review by all duly identified sharing operators by any means.
- (e) After closure of all findings identified during the audit, the EU operator should submit an audit compliance statement to the competent authority demonstrating that the third country operator meets all the applicable safety standards.

AMC2 ORO.AOC.115(b) Code-share agreements

ED Decision 2019/019/R

THIRD-PARTY PROVIDERS

- (a) The initial audit and/or the continuous monitoring may be performed by a third-party provider on behalf of the EU operator in accordance with [AMC2 ORO.GEN.205](#) on contracted activities.
- (b) The use of a third-party provider for the initial audit or the monitoring of continuous compliance of the third-country code-share operator does not exempt the EU operator from its responsibility under [ORO.AOC.115](#).
- (c) The EU operator should maintain a list of the third country code-share operators monitored by the third-party provider. This list and the full audit report prepared by the third-party provider should be made available to the competent authority upon request.

ORO.AOC.120 Approvals to provide cabin crew training and to issue cabin crew attestations

Regulation (EU) No 965/2012

- (a) When intending to provide the training course required in Annex V (Part-CC) to Regulation (EU) No 1178/2011, the operator shall apply for and obtain an approval issued by the competent authority. For this purpose, the applicant shall demonstrate compliance with the requirements for the conduct and content of training course established in CC.TRA.215 and CC.TRA.220 of that Annex and shall provide the competent authority with:
 - (1) the date of intended commencement of activity;
 - (2) the personal details and qualifications of the instructors as relevant to the training elements to be covered;
 - (3) the name(s) and address(es) of the training site(s) at which the training is to be conducted;
 - (4) a description of the facilities, training methods, manuals and representative devices to be used; and
 - (5) the syllabi and associated programmes for the training course.
- (b) If a Member State decides, in accordance with ARA.CC.200 of Annex VI (Part-ARA) to Regulation (EU) No 1178/2011, that operators may be approved to issue cabin crew attestations, the applicant shall, in addition to (a):
 - (1) demonstrate to the competent authority that:
 - (i) the organisation has the capability and accountability to perform this task;
 - (ii) the personnel conducting examinations are appropriately qualified and free from conflict of interest; and
 - (2) provide the procedures and the specified conditions for:
 - (i) conducting the examination required by CC.TRA.220;
 - (ii) issuing cabin crew attestations; and
 - (iii) supplying the competent authority with all relevant information and documentation related to the attestations it will issue and their holders, for the purpose of record-keeping, oversight and enforcement actions by that authority.
- (c) The approvals referred to in (a) and (b) shall be specified in the operations specifications.

ORO.AOC.125 Non-commercial operations of an AOC holder with aircraft listed on its AOC

Regulation (EU) 2019/1384

- (a) The AOC holder may conduct non-commercial operations in accordance with Annex VI (Part-NCC) or Annex VII (Part-NCO) with aircraft listed in the operations specifications of its AOC or in its operations manual, provided that the AOC holder describes such operations in detail in the operations manual, including the following:
 - (1) an identification of the applicable requirements:

- (2) a description of any differences between operating procedures used when conducting CAT operations and non-commercial operations;
- (3) means of ensuring that all personnel involved in the operations are fully familiar with the associated procedures;
- (b) An AOC holder shall comply with:
 - (1) Annex VIII (Part-SPO) when conducting maintenance check flights with complex motor-powered aircraft;
 - (2) Annex VII (Part-NCO) when conducting maintenance check flights with other than complex motor-powered aircraft.
- (c) An AOC holder conducting operations referred to in points (a) and (b) shall not be required to submit a declaration in accordance with this Annex.
- (d) The AOC holder shall specify the type of flight, as listed in its operations manual, in the flight-related documents (operational flight plan, loadsheet and other equivalent documents).

AMC1 ORO.AOC.125(a) Non-commercial operations of an AOC holder with aircraft listed on its AOC

ED Decision 2019/019/R

FLIGHT AND DUTY TIME LIMITATIONS AND REST REQUIREMENTS

When aircrew members are assigned to perform a series of flights that combine several types of operation (CAT, NCC/NCO), the operator should:

- (a) comply at any time with the provisions of [ORO.FTL.210](#) 'Flight times and duty periods' or, as applicable, the provisions of Council Regulation (EEC) No 3922/91 (EU-OPS, Subpart Q), to ensure compliance with Subpart FTL for any CAT operation; and
- (b) include any combination of types of operation in its safety risk management process to ensure that the fatigue risks arising from such operations do not affect the CAT operation.

AMC2 ORO.AOC.125(a) Non-commercial operations of an AOC holder with aircraft listed on its AOC

ED Decision 2019/019/R

APPLICABLE REQUIREMENTS

An AOC holder should apply either of the options below to its non-commercial operations:

- (a) the same operational procedures as those used for its CAT operations. In this case, the AOC holder should state this option in the operations manual and ensure that the procedures comply with Part-CAT. No further descriptions are required; or
- (b) different operational procedures from those used for its CAT operations. In this case, the procedures should comply with Part-ORO, except for Subpart-DEC, and Part-NCC for complex motor-powered aircraft or with Part-NCO for other than complex motor-powered aircraft, as appropriate.

AMC1 ORO.AOC.125(a)(2) Non-commercial operations of an AOC holder with aircraft listed on its AOC

ED Decision 2019/019/R

DIFFERENT OPERATING PROCEDURES FOR NON-COMMERCIAL OPERATIONS

When developing operating procedures for non-commercial operations that are different from the ones used for its CAT operations, the AOC holder should identify the hazards and assess and mitigate the risks associated with each specific non-commercial operation, as part of the safety risk management process in compliance with [ORO.GEN.200](#).

This process should consider at least the following elements:

- (a) Flight profile (including manoeuvres to be performed, any simulated abnormal situations in flight, duties and responsibilities of the crew members);
- (b) Continuing airworthiness, as applicable. This includes the case when the aircraft is returned to the AOC holder after having been used by another operator for operations in accordance with [ORO.GEN.310](#);
- (c) Levels of functional equipment and systems (MEL, CDL);
- (d) Operating procedures, minima, and dispatch criteria;
- (e) Operating a flight with a double purpose (e.g. a relocation flight used as a line training flight or a maintenance check flight used as a line training flight);
- (f) Specific approvals held by the AOC holder;
- (g) Flight and duty time limitations and rest requirements and cumulative fatigue;
- (h) Selection, composition, and training of flight crew and cabin crew;
- (i) Multi-pilot operation as per Part-CAT vs single-pilot operation when operating according to Part-NCC or Part-NCO;
- (j) Flights performed with aircrew that includes aircrew members of another operator, who have not completed a familiarisation training and who may not be familiar with the AOC holder's operational procedures;
- (k) Categories of passengers on board, including when non-commercial operations are performed with no cabin crew.

AMC2 ORO.AOC.125(a)(2) Non-commercial operations of an AOC holder with aircraft listed on its AOC

ED Decision 2019/019/R

PLANNING FLIGHTS WITH AN INCREASED LEVEL OF RISK

- (a) Significant aspects such as the ones below should be addressed in the risk assessment and risk mitigation process by any operator conducting such flights:
 - (1) which pilots are involved in their operation;
 - (2) what is the purpose of the flight; and
 - (3) how it is to be accomplished — what flight procedures are to be applied.
- (b) The AOC holder should prepare the non-commercial operations with an increased level of risk taking into consideration the following elements, as applicable:

- (1) pre-flight briefing;
- (2) duties and responsibilities of the flight crew members involved, task sharing;
- (3) special operating procedures;
- (4) manoeuvres to be performed in flight, minimum and maximum speeds and altitudes for all portions of the flight;
- (5) operational limitations;
- (6) potential risks and contingency plans;
- (7) adequate available airspace and coordination with the air traffic control (ATC);
- (8) selection of flight crew members; and
- (9) additional flight crew training at regular intervals to ensure recency (considering also a flight of a similar risk profile in the simulator, if needed).

GM1 ORO.AOC.125(a)(2) Non-commercial operations of an AOC holder with aircraft listed on an AOC

ED Decision 2019/019/R

EXAMPLES OF DIFFERENT OPERATING PROCEDURES APPLIED TO NON-COMMERCIAL OPERATIONS

The provisions of [ORO.AOC.125](#) enable an AOC holder to apply the most appropriate requirements when conducting non-commercial operations, based on the risk assessment and risk mitigation processes.

Below is a non-exhaustive list of elements that an AOC holder may identify and describe as being different in its non-commercial operations from those used for its CAT operation and for which the provisions of Part-ORO and Part-NCC or the provisions of Part-NCO should apply as appropriate:

- (a) Qualification, training and experience of aircrew members, including aerodrome and route competence requirements.
- (b) Flight crew and cabin crew composition requirements
 - (1) CAT operations contain more stringent requirements for aircrew members, e.g. multi-pilot vs single-pilot requirements.
 - (2) The AOC holder should specify the minimum number of flight crew and cabin crew and the applicable aircrew composition.
- (c) Fuel requirements
- (d) Performance requirements
- (e) Serviceable instruments, data and equipment and MEL considerations
- (f) Non-ETOPS/ETOPS

ETOPS are applicable to CAT operations only and thus a flight operated according to Part-NCC/Part-NCO may be performed without the ETOPS restrictions.
- (g) Non-commercial flights with no cabin crew (see [ORO.CC.100\(d\)](#) and the associated AMC).

ORO.AOC.130 Flight data monitoring – aeroplanes

Regulation (EU) 2015/1329

- (a) The operator shall establish and maintain a flight data monitoring programme, which shall be integrated in its management system, for aeroplanes with a maximum certificated take-off mass of more than 27 000 kg.
- (b) The flight data monitoring programme shall be non-punitive and contain adequate safeguards to protect the source(s) of the data.

AMC1 ORO.AOC.130 Flight data monitoring – aeroplanes

ED Decision 2021/005/R

FLIGHT DATA MONITORING (FDM) PROGRAMME

- (a) The safety manager, as defined under [AMC1-ORO.GEN.200\(a\)\(1\)](#), should be responsible for the identification and assessment of issues and their transmission to the manager(s) responsible for the process(es) concerned. The latter should be responsible for taking appropriate and practicable safety action within a reasonable period of time that reflects the severity of the issue.
- (b) An FDM programme should allow an operator to:
 - (1) identify areas of operational risk and quantify current safety margins;
 - (2) identify and quantify operational risks by highlighting occurrences of non-standard, unusual or unsafe circumstances;
 - (3) use the FDM information on the frequency of such occurrences, combined with an estimation of the level of severity, to assess the safety risks and to determine which may become unacceptable if the discovered trend continues;
 - (4) put in place appropriate procedures for remedial action once an unacceptable risk, either actually present or predicted by trending, has been identified; and
 - (5) confirm the effectiveness of any remedial action by continued monitoring.
- (c) FDM analysis techniques should comprise the following:
 - (1) Exceedance detection: searching for deviations from aircraft flight manual limits and standard operating procedures. A set of core events should be selected to cover the main areas of interest to the operator and as much as possible, the most significant risks identified by the operator. The event definitions should be continuously reviewed to reflect the operator's current operating procedures.
 - (2) All flights measurement: a system defining what is normal practice. This may be accomplished by retaining various snapshots of information from each flight.
 - (3) Statistics — a series of data collected to support the analysis process: this technique should include the number of flights flown per aircraft and sector details sufficient to generate rate and trend information.
- (d) FDM analysis, assessment and process control tools: the effective assessment of information obtained from digital flight data should be dependent on the provision of appropriate information technology tool sets.

- (e) Education and publication: sharing safety information should be a fundamental principle of aviation safety in helping to reduce accident rates. The operator should pass on the lessons learnt to all relevant personnel and, where appropriate, industry.
- (f) Accident and incident data requirements specified in [CAT.GEN.MPA.195](#) take precedence over the requirements of an FDM programme. In these cases the FDR data should be retained as part of the investigation data and may fall outside the de-identification agreements.
- (g) Every crew member should be responsible for reporting events. Significant risk-bearing incidents detected by FDM should therefore normally be the subject of mandatory occurrence reporting by the crew. If this is not the case, then they should submit a retrospective report that should be included under the normal process for reporting and analysing hazards, incidents and accidents.
- (h) The data recovery strategy should ensure a sufficiently representative capture of flight information to maintain an overview of operations. Data analysis should be performed sufficiently frequently to enable action to be taken on significant safety issues.
- (i) The data retention strategy should aim at providing the greatest safety benefits practicable from the available data. A full dataset should be retained until the action and review processes are complete; thereafter, a reduced dataset relating to closed issues should be maintained for longer-term trend analysis. Programme managers may wish to retain samples of de-identified full-flight data for various safety purposes (detailed analysis, training, benchmarking, etc.).
- (j) The data access and security policy should restrict information access to authorised persons. When data access is required for airworthiness and maintenance purposes, a procedure should be in place to prevent disclosure of crew identity.
- (k) The procedure to prevent disclosure of crew identity should be written in a document, which should be signed by all parties (airline management, flight crew member representatives nominated either by the union or the flight crew themselves). This procedure should, as a minimum, define:
 - (1) the aim of the FDM programme;
 - (2) a data access and security policy that should restrict access to information to specifically authorised persons identified by their position;
 - (3) the method to obtain de-identified crew feedback on those occasions that require specific flight follow-up for contextual information; where such crew contact is required the authorised person(s) need not necessarily be the programme manager or safety manager, but could be a third party (broker) mutually acceptable to unions or staff and management;
 - (4) the data retention policy and accountability, including the measures taken to ensure the security of the data;
 - (5) the conditions under which advisory briefing or remedial training should take place; this should always be carried out in a constructive and non-punitive manner;
 - (6) the conditions under which the confidentiality may be withdrawn for reasons of gross negligence or significant continuing safety concern;
 - (7) the participation of flight crew member representative(s) in the assessment of the data, the action and review process and the consideration of recommendations; and
 - (8) the policy for publishing the findings resulting from FDM.

- (l) Airborne systems and equipment used to obtain FDM data should range from a quick access recorder (QAR) in an aircraft with digital systems, to a crash-protected flight recorder in an older or less sophisticated aircraft. The analysis potential of the reduced data set available in the latter case may reduce the safety benefits obtainable. The operator should ensure that FDM use does not adversely affect the serviceability of equipment required for accident investigation.

GM1 ORO.AOC.130 Flight data monitoring – aeroplanes

ED Decision 2021/005/R

IMPLEMENTATION OF AN FDM PROGRAMME

Flight data monitoring is defined in Annex I to this Regulation. It should be noted that the requirement to establish a FDM programme is applicable to all individual aircraft in the scope of [ORO.AOC.130](#), not to a subset selected by the operator.

- (a) FDM analysis techniques
- (1) Exceedance detection
- (i) FDM programmes are used for detecting exceedances, such as deviations from flight manual limits, standard operating procedures (SOPs), or good airmanship. Typically, a set of core events establishes the main areas of interest that are based on a prior assessment of the most significant risks by the operator. In addition, it is advisable to consider the following risks: risk of runway excursion or abnormal runway contact at take-off or landing, risk of loss of control in flight, risk of airborne collision, and risk of collision with terrain.
- Examples: low or high lift-off rotation rate, stall warning, ground proximity warning system (GPWS) warning, flap limit speed exceedance, fast approach, high or low on glideslope, heavy landing.
- (ii) Trigger logic expressions may be simple exceedances such as redline values. The majority, however, are composites that define a certain flight mode, aircraft configuration or payload-related condition. Analysis software can also assign different sets of rules dependent on airport or geography. For example, noise sensitive airports may use higher than normal glideslopes on approach paths over populated areas. In addition, it might be valuable to define several levels of exceedance severity (such as low, medium and high).
- (iii) Exceedance detection provides useful information, which can complement that provided in crew reports.
- Examples: reduced flap landing, emergency descent, engine failure, rejected take-off, go-around, airborne collision avoidance system (ACAS) or GPWS warning, and system malfunctions.
- (iv) The operator may also modify the standard set of core events to account for unique situations they regularly experience, or the SOPs they use.
- Example: to avoid nuisance exceedance reports from a non-standard instrument departure.
- (v) The operator may also define new events to address specific problem areas.
- Example: restrictions on the use of certain flap settings to increase component life.

(2) All-flights measurements

FDM data are retained from all flights, not just the ones producing significant events. A selection of parameters is retained that is sufficient to characterise each flight and allow a comparative analysis of a wide range of operational variability. Emerging trends and tendencies may be identified and monitored before the trigger levels associated with exceedances are reached.

Examples of parameters monitored: take-off weight, flap setting, temperature, rotation and lift-off speeds versus scheduled speeds, maximum pitch rate and attitude during rotation, and gear retraction speeds, heights and times.

Examples of comparative analyses: pitch rates from high versus low take-off weights, good versus bad weather approaches, and touchdowns on short versus long runways.

(3) Statistics

Series of data are collected to support the analysis process: these usually include the numbers of flights flown per aircraft and sector details sufficient to generate rate and trend information.

(4) Investigation of incidents flight data

Recorded flight data provide valuable information for follow-up to incidents and other technical reports. They are useful in adding to the impressions and information recalled by the flight crew. They also provide an accurate indication of system status and performance, which may help in determining cause and effect relationships.

Examples of incidents where recorded data could be useful:

- high cockpit workload conditions as corroborated by such indicators as late descent, late localizer and/or glideslope interception, late landing configuration;
- unstabilised and rushed approaches, glide path excursions, etc.;
- exceedances of prescribed operating limitations (such as flap limit speeds, engine overtemperatures); and
- wake vortex encounters, turbulence encounters or other vertical accelerations.

It should be noted that recorded flight data have limitations, e.g. not all the information displayed to the flight crew is recorded, the source of recorded data may be different from the source used by a flight instrument, the sampling rate or the recording resolution of a parameter may be insufficient to capture accurate information.

(5) Continuing airworthiness

Data of all-flight measurements and exceedance detections can be utilised to assist the continuing airworthiness function. For example, engine-monitoring programmes look at measures of engine performance to determine operating efficiency and predict impending failures.

Examples of continuing airworthiness uses: engine thrust level and airframe drag measurements, avionics and other system performance monitoring, flying control performance, and brake and landing gear usage.

(b) FDM equipment

(1) General

FDM programmes generally involve systems that capture flight data, transform the data into an appropriate format for analysis, and generate reports and visualisation to assist in assessing the data. Typically, the following equipment capabilities are needed for effective FDM programmes:

- (i) an on-board device to capture and record data on a wide range of in-flight parameters;
- (ii) a means to transfer the data recorded on board the aircraft to a ground-based processing station;
- (iii) a ground-based computer system to analyse the data, identify deviations from expected performance, generate reports to assist in interpreting the read-outs, etc.; and
- (iv) optional software for a flight animation capability to integrate all data, presenting them as a simulation of in-flight conditions, thereby facilitating visualisation of actual events.

(2) Airborne equipment

- (i) The flight parameters and recording capacity required for flight data recorders (FDR) to support accident investigations may be insufficient to support an effective FDM programme. Other technical solutions are available, including the following:
 - (A) Quick access recorders (QARs). QARs are installed in the aircraft and record flight data onto a low-cost removable medium.
 - (B) Some systems automatically download the recorded information via secure wireless systems when the aircraft is in the vicinity of the gate. There are also systems that enable the recorded data to be analysed on board while the aircraft is airborne.
- (ii) Fleet composition, route structure and cost considerations will determine the most cost-effective method of removing the data from the aircraft.

(3) Ground replay and analysis equipment

- (i) Data are downloaded from the aircraft recording device into a ground-based processing station, where the data are held securely to protect this sensitive information.
- (ii) FDM programmes generate large amounts of data requiring specialised analysis software.
- (iii) The analysis software checks the downloaded flight data for abnormalities.
- (iv) The analysis software may include: annotated data trace displays, engineering unit listings, visualisation for the most significant incidents, access to interpretative material, links to other safety information and statistical presentations.

(c) FDM in practice

(1) FDM process

Typically, operators follow a closed-loop process in applying an FDM programme, for example:

- (i) Establish a baseline: initially, operators establish a baseline of operational parameters against which changes can be detected and measured.

Examples: rate of unstable approaches or hard landings.

- (ii) Highlight unusual or unsafe circumstances: the user determines when non-standard, unusual or basically unsafe circumstances occur; by comparing them to the baseline margins of safety, the changes can be quantified.

Example: increases in unstable approaches (or other unsafe events) at particular locations.

- (iii) Identify unsafe trends: based on the frequency and severity of occurrence, trends are identified. Combined with an estimation of the level of severity, the risks are assessed to determine which may become unacceptable if the trend continues.

Example: a new procedure has resulted in high rates of descent that are nearly triggering GPWS warnings.

- (iv) Mitigate risks: once an unacceptable risk has been identified, appropriate risk mitigation actions are decided on and implemented.

Example: having found high rates of descent, the SOPs are changed to improve aircraft control for optimum/maximum rates of descent.

- (v) Monitor effectiveness: once a remedial action has been put in place, its effectiveness is monitored, confirming that it has reduced the identified risk and that the risk has not been transferred elsewhere.

Example: confirm that other safety measures at the aerodrome with high rates of descent do not change for the worse after changes in approach procedures.

(2) Analysis and follow-up

- (i) FDM data are typically compiled every month or at shorter intervals. The data are then reviewed to identify specific exceedances and emerging undesirable trends and to disseminate the information to flight crews.

- (ii) If deficiencies in pilot handling technique are evident, the information is usually de-identified in order to protect the identity of the flight crew. The information on specific exceedances is passed to a person (safety manager, agreed flight crew representative, honest broker) assigned by the operator for confidential discussion with the pilot. The person assigned by the operator provides the necessary contact with the pilot in order to clarify the circumstances, obtain feedback and give advice and recommendations for appropriate action. Such appropriate action could include re-training for the pilot (carried out in a constructive and non-punitive way), revisions to manuals, changes to ATC and airport operating procedures.

- (iii) Follow-up monitoring enables the effectiveness of any corrective actions to be assessed. Flight crew feedback is essential for the identification and resolution of safety problems and could be collected through interviews, for example by asking the following:

- (A) Are the desired results being achieved soon enough?
 - (B) Have the problems really been corrected, or just relocated to another part of the system?
 - (C) Have new problems been introduced?
 - (iv) All events are usually archived in a database. The database is used to sort, validate and display the data in easy-to-understand management reports. Over time, this archived data can provide a picture of emerging trends and hazards that would otherwise go unnoticed.
 - (v) Lessons learnt from the FDM programme may warrant inclusion in the operator's safety promotion programmes. Safety promotion media may include newsletters, flight safety magazines, highlighting examples in training and simulator exercises, periodic reports to industry and the competent authority. Care is required, however, to ensure that any information acquired through FDM is de-identified before using it in any training or promotional initiative.
 - (vi) All successes and failures are recorded, comparing planned programme objectives with expected results. This provides a basis for review of the FDM programme and the foundation for future programme development.
- (d) Preconditions for an effective FDM programme
 - (1) Protection of FDM data

The integrity of FDM programmes rests upon protection of the FDM data. Any disclosure for purposes other than safety management can compromise the voluntary provision of safety data, thereby compromising flight safety.
 - (2) Essential trust

The trust established between management and flight crew is the foundation for a successful FDM programme. This trust can be facilitated by:

 - (i) early participation of the flight crew representatives in the design, implementation and operation of the FDM programme;
 - (ii) a formal agreement between management and flight crew, identifying the procedures for the use and protection of data; and
 - (iii) data security, optimised by:
 - (A) adhering to the agreement;
 - (B) the operator strictly limiting data access to selected individuals;
 - (C) maintaining tight control to ensure that identifying data is kept securely; and
 - (D) ensuring that operational problems are promptly addressed by management.
 - (3) Requisite safety culture

Indicators of an effective safety culture typically include:

 - (i) top management's demonstrated commitment to promoting a proactive safety culture;
 - (ii) a non-punitive operator policy that covers the FDM programme;

- (iii) FDM programme management by dedicated staff under the authority of the safety manager, with a high degree of specialisation and logistical support;
 - (iv) involvement of persons with appropriate expertise when identifying and assessing the risks (for example, pilots experienced on the aircraft type being analysed);
 - (v) monitoring fleet trends aggregated from numerous operations, not focusing only on specific events;
 - (vi) a well-structured system to protect the confidentiality of the data; and
 - (vii) an efficient communication system for disseminating hazard information (and subsequent risk assessments) internally and to other organisations to permit timely safety action.
- (e) Implementing an FDM programme
- (1) General considerations
 - (i) Typically, the following steps are necessary to implement an FDM programme:
 - (A) implementation of a formal agreement between management and flight crew;
 - (B) establishment and verification of operational and security procedures;
 - (C) installation of equipment;
 - (D) selection and training of dedicated and experienced staff to operate the programme; and
 - (E) commencement of data analysis and validation.
 - (ii) An operator with no FDM experience may need a year to achieve an operational FDM programme. Another year may be necessary before any safety and cost benefits appear. Improvements in the analysis software, or the use of outside specialist service providers, may shorten these time frames.
 - (2) Aims and objectives of an FDM programme
 - (i) As with any project there is a need to define the direction and objectives of the work. A phased approach is recommended so that the foundations are in place for possible subsequent expansion into other areas. Using a building block approach will allow expansion, diversification and evolution through experience.

Example: with a modular system, begin by looking at basic safety-related issues only. Add engine health monitoring, etc. in the second phase. Ensure compatibility with other systems.
 - (ii) A staged set of objectives starting from the first week's replay and moving through early production reports into regular routine analysis will contribute to a sense of achievement as milestones are met.

Examples of short-term, medium-term and long-term goals:

 - (A) Short-term goals:
 - establish data download procedures, test replay software and identify aircraft defects;
 - validate and investigate exceedance data; and

- establish a user-acceptable routine report format to highlight individual exceedances and facilitate the acquisition of relevant statistics.
- (B) Medium-term goals:
 - produce an annual report — include key performance indicators;
 - add other modules to the analysis (e.g. continuing airworthiness); and
 - plan for the next fleet to be added to programme.
- (C) Long-term goals:
 - network FDM information across all of the operator's safety information systems;
 - ensure FDM provision for any proposed alternative training and qualification programme (ATQP); and
 - use utilisation and condition monitoring to reduce spares holdings.
- (iii) Initially, focusing on a few known areas of interest will help prove the system's effectiveness. In contrast to an undisciplined 'scatter-gun' approach, a focused approach is more likely to gain early success.

Examples: rushed approaches, or rough runways at particular aerodromes. Analysis of such known problem areas may generate useful information for the analysis of other areas.

(3) The FDM team

- (i) Experience has shown that the 'team' necessary to run an FDM programme could vary in size from one person for a small fleet, to a dedicated section for large fleets. The descriptions below identify various functions to be fulfilled, not all of which need a dedicated position.
 - (A) Team leader: it is essential that the team leader earns the trust and full support of both management and flight crew. The team leader acts independently of others in line management to make recommendations that will be seen by all to have a high level of integrity and impartiality. The individual requires good analytical, presentation and management skills.
 - (B) Flight operations interpreter: this person is usually a current pilot (or perhaps a recently retired senior captain or instructor), who knows the operator's route network and aircraft. This team member's in-depth knowledge of SOPs, aircraft handling characteristics, aerodromes and routes is used to place the FDM data in a credible context.
 - (C) Technical interpreter: this person interprets FDM data with respect to the technical aspects of the aircraft operation and is familiar with the power plant, structures and systems departments' requirements for information and any other engineering monitoring programmes in use by the operator.
 - (D) Gate-keeper: this person provides the link between the fleet or training managers and flight crew involved in events highlighted by FDM. The position requires good people skills and a positive attitude towards safety education. The person is typically a representative of the flight crew association or an 'honest broker' and is the only person permitted to

connect the identifying data with the event. It is essential that this person earns the trust of both management and flight crew.

- (E) Engineering technical support: this person is usually an avionics specialist, involved in the supervision of mandatory serviceability requirements for FDR systems. This team member is knowledgeable about FDM and the associated systems needed to run the programme.
 - (F) Replay operative and administrator: this person is responsible for the day-to-day running of the system, producing reports and analysis.
- (ii) All FDM team members need appropriate training or experience for their respective area of data analysis. Each team member is allocated a realistic amount of time to regularly spend on FDM tasks.

GM2 ORO.AOC.130 Flight data monitoring — aeroplanes

ED Decision 2021/005/R

EXAMPLES OF FDM EVENTS

The following table provides examples of FDM events that may be further developed using operator and aeroplane specific limits. The table is considered illustrative and not exhaustive. Other examples may be found in the documents published by the [European Operators Flight Data Monitoring \(EOFDM\) forum](#).

Event Group	Description
Rejected take-off	High speed rejected take-off
Take-off pitch	Pitch rate low or high on take-off
	Pitch attitude high during take-off
Unstick speeds	Unstick speed high
	Unstick speed low
Height loss in climb-out	Initial climb height loss 20 ft above ground level (AGL) to 400 ft above aerodrome level (AAL)
	Initial climb height loss 400 ft to 1 500 ft AAL
Slow climb-out	Excessive time to 1 000 ft AAL after take-off
Climb-out speeds	Climb-out speed high below 400 ft AAL
	Climb-out speed high 400 ft AAL to 1 000 ft AAL
	Climb-out speed low 35 ft AGL to 400 ft AAL
	Climb-out speed low 400 ft AAL to 1 500 ft AAL
High rate of descent	High rate of descent below 2 000 ft AGL
Missed approach	Missed approach below 1 000 ft AAL
	Missed approach above 1 000 ft AAL
Low approach	Low on approach
Glideslope	Deviation under glideslope
	Deviation above glideslope (below 600 ft AGL)
Approach power	Low power on approach
Approach speeds	Approach speed high within 90 seconds of touchdown
	Approach speed high below 500 ft AAL
	Approach speed high below 50 ft AGL
	Approach speed low within 2 minutes of touchdown
Landing flap	Late land flap (not in position below 500 ft AAL)

Event Group	Description
	Reduced flap landing
	Flap load relief system operation
Landing pitch	Pitch attitude high on landing
	Pitch attitude low on landing
Bank angles	Excessive bank below 100 ft AGL
	Excessive bank 100 ft AGL to 500 ft AAL
	Excessive bank above 500 ft AGL
	Excessive bank near ground (below 20 ft AGL)
Normal acceleration	High normal acceleration on ground
	High normal acceleration in flight flaps up (+/- increment)
	High normal acceleration in flight flaps down(+/- increment)
	High normal acceleration at landing
Abnormal configuration	Take-off configuration warning
	Early configuration change after take-off (flap)
	Speed brake with flap
	Speed brake on approach below 800 ft AAL
	Speed brake not armed below 800 ft AAL
Ground proximity warning	Ground proximity warning system (GPWS) operation - hard warning
	GPWS operation — soft warning
	GPWS operation — windshear warning
	GPWS operation — false warning
Airborne collision avoidance system (ACAS II) warning	ACAS operation — Resolution Advisory
Margin to stall/buffet	Stick shake
	False stick shake
	Reduced lift margin except near ground
	Reduced lift margin at take-off
	Low buffet margin (above 20 000 ft)
Aircraft flight manual limitations	Maximum operating speed limit (V _{MO}) exceedance
	Maximum operating speed limit (M _{MO}) exceedance
	Flap placard speed exceedance
	Gear down speed exceedance
	Gear selection up/down speed exceedance
	Flap/slat altitude exceedance
	Maximum operating altitude exceedance

GM3 ORO.AOC.130 Flight data monitoring – aeroplanes

ED Decision 2021/005/R

GUIDANCE AND INDUSTRY GOOD PRACTICE

- (a) Additional guidance material for the establishment of flight data monitoring may be found in:
- (1) International Civil Aviation Organization (ICAO) Doc 10000 'Manual on Flight Data Analysis Programmes (FDAP)'; and

- (2) UK Civil Aviation Authority CAP 739 (Flight Data Monitoring), second edition dated June 2013.
- (b) Examples of industry good practice for the establishment of flight data monitoring may be found in the documents published by the [European Operators Flight Data Monitoring \(EOFDM\) forum](#).

ORO.AOC.135 Personnel requirements

Regulation (EU) 2019/1384

- (a) In accordance with point [ORO.GEN.210\(b\)](#), the operator shall nominate persons responsible for the management and supervision of the following areas:
 - (1) flight operations;
 - (2) crew member training;
 - (3) ground operations;
 - (4) continuing airworthiness or for the continuing airworthiness management contract in accordance with Regulation (EU) No 1321/2014, as the case may be.
- (b) *Adequacy and competency of personnel*
 - (1) The operator shall employ sufficient personnel for the planned ground and flight operations.
 - (2) All personnel assigned to, or directly involved in, ground and flight operations shall:
 - (i) be properly trained;
 - (ii) demonstrate their capabilities in the performance of their assigned duties; and
 - (iii) be aware of their responsibilities and the relationship of their duties to the operation as a whole.
- (c) *Supervision of personnel*
 - (1) The operator shall appoint a sufficient number of personnel supervisors, taking into account the structure of the operator's organisation and the number of personnel employed.
 - (2) The duties and responsibilities of these supervisors shall be defined, and any other necessary arrangements shall be made to ensure that they can discharge their supervisory responsibilities.
 - (3) The supervision of crew members and personnel involved in the operation shall be exercised by individuals with adequate experience and the skills to ensure the attainment of the standards specified in the operations manual.

AMC1 ORO.AOC.135(a) Personnel requirements

ED Decision 2014/017/R

NOMINATED PERSONS

- (a) The person may hold more than one of the nominated posts if such an arrangement is considered suitable and properly matched to the scale and scope of the operation.
- (b) A description of the functions and the responsibilities of the nominated persons, including their names, should be contained in the operations manual.

- (c) The holder of an AOC should make arrangements to ensure continuity of supervision in the absence of nominated persons.
- (d) The person nominated by the holder of an AOC should not be nominated by another holder of an AOC, unless agreed with the competent authorities concerned.
- (e) Persons nominated should be contracted to work sufficient hours to fulfil the management functions associated with the scale and scope of the operation.

AMC2 ORO.AOC.135(a) Personnel requirements

ED Decision 2014/017/R

COMBINATION OF NOMINATED PERSONS RESPONSIBILITIES

- (a) The acceptability of a single person holding several posts, possibly in combination with being the accountable manager, should depend upon the nature and scale of the operation. The two main areas of concern should be competence and an individual's capacity to meet his/her responsibilities.
- (b) As regards competence in different areas of responsibility, there should not be any difference from the requirements applicable to persons holding only one post.
- (c) The capacity of an individual to meet his/her responsibilities should primarily be dependent upon the scale of the operation. However, the complexity of the organisation or of the operation may prevent, or limit, combinations of posts which may be acceptable in other circumstances.
- (d) In most circumstances, the responsibilities of a nominated person should rest with a single individual. However, in the area of ground operations, it may be acceptable for responsibilities to be split, provided that the responsibilities of each individual concerned are clearly defined.

AMC1 ORO.AOC.135(a)(4) Personnel requirements

ED Decision 2022/017/R

NOMINATED PERSON RESPONSIBLE FOR THE MANAGEMENT AND SUPERVISION OF THE CONTRACT WITH A CAMO PURSUANT TO POINT M.A.201(ea)

If the operator concludes a contract with a CAMO pursuant to point M.A.201(ea) of Annex I (Part-M) to [Regulation \(EU\) No 1321/2014](#), the person nominated by the operator in accordance with point [ORO.AOC.135\(a\)\(4\)](#) is responsible for the management and supervision of the continuing airworthiness management contract that is required by Appendix I to Part-M. This person should not be employed by the contracted CAMO to avoid conflict of interest. In addition, this person should have the following:

- (a) practical experience and expertise in the application of aviation safety standards and safe operating practices;
- (b) comprehensive knowledge of:
 - (i) the relevant parts of operational requirements and procedures;
 - (ii) the air operator certificate (AOC) holder's operations specifications;
 - (iii) the relevant parts of the AOC holder's operations manual; and
 - (iv) the relevant parts of the continuing airworthiness management exposition (CAME) of the contracted CAMO;

- (c) knowledge of:
 - (i) human factors (HF) principles; and
 - (ii) safety management system (SMS) based on the EU management system requirements (including compliance monitoring) and International Civil Aviation Organization (ICAO) Annex 19;
- (d) 5 years of relevant work experience, of which at least 2 years in an appropriate position in the aeronautical industry;
- (e) a relevant engineering or technical degree, or an aircraft maintenance technician qualification with additional education that is acceptable to the competent authority; this condition may be replaced by 3 years of experience in addition to those specified in point (d); those 3 years should include an appropriate combination of experience in tasks related to aircraft maintenance and/or continuing airworthiness management and/or surveillance of such tasks;
- (f) thorough knowledge of:
 - (i) the continuing airworthiness management contract;
 - (ii) the organisation's management systems' interfaces; and
 - (iii) the way of achieving harmonisation of those management systems;
- (g) knowledge of a relevant sample of the type(s) of aircraft operated by the organisation, which is gained through a formalised training course; such a course should be at least at a level equivalent to Part-66 (Annex III to [Regulation \(EU\) No 1321/2014](#)), Appendix III, Level 1 'General Familiarisation' and may be provided by a Part-147 (Annex IV to [Regulation \(EU\) No 1321/2014](#)) organisation, by the manufacturer, by the CAMO, or by any other organisation that is accepted by the competent authority; 'relevant sample' means that the related course should cover typical aircraft and aircraft systems that are operated by the organisation; and
- (h) knowledge of [Regulation \(EU\) No 1321/2014](#).

GM1 ORO.AOC.135(a) Personnel requirements

ED Decision 2014/017/R

NOMINATED PERSONS

The smallest organisation that can be considered is the one-man organisation where all of the nominated posts are filled by the accountable manager, and audits are conducted by an independent person.

GM2 ORO.AOC.135(a) Personnel requirements

ED Decision 2022/017/R

COMPETENCE OF NOMINATED PERSONS

- (a) Nominated persons in accordance with [ORO.AOC.135](#) should be expected to possess the experience and meet the qualification provisions of (b) to (f) respectively. Exceptionally, in particular cases, where the nominated person does not meet these provisions in full, the nominee should have comparable experience and also the ability to perform effectively the functions associated with the post and with the scale of the operation.

- (b) Nominated persons for flight operations, crew training and ground operations should have:
- (1) practical experience and expertise in the application of aviation safety standards and safe operating practices;
 - (2) comprehensive knowledge of:
 - (i) the applicable EU safety regulations and any associated requirements and procedures;
 - (ii) the AOC holder's operations specifications; and
 - (iii) the need for, and content of, the relevant parts of the AOC holder's operations manual;
 - (3) familiarity with management systems preferably in the area of aviation;
 - (4) appropriate management experience, preferably in a comparable organisation; and
 - (5) 5 years of relevant work experience of which at least 2 years should be from the aeronautical industry in an appropriate position.
- (c) Flight operations. The nominated person should hold or have held a valid flight crew licence and the associated ratings appropriate to a type of operation conducted under the AOC. In case the nominated person's licence and ratings are not current, his/her deputy should hold a valid flight crew licence and the associated ratings.
- (d) Crew training. The nominated person or his/her deputy should be a current type rating instructor on a type/class operated under the AOC. The nominated person should have a thorough knowledge of the AOC holder's crew training concept for flight, cabin and when relevant other crew.
- (e) Ground operations. The nominated person should have a thorough knowledge of the AOC holder's ground operations concept.
- (f) Continuing airworthiness. The nominated person for continuing airworthiness or for the continuing airworthiness management contract, as the case may be, should have the relevant knowledge, background and experience in accordance with [Regulation \(EU\) No 1321/2014](#). If a continuing airworthiness management organisation (CAMO) is contracted by the operator pursuant to point M.A.201(ea) of Annex I (Part-M) to [Regulation \(EU\) No 1321/2014](#), please refer to [AMC1 ORO.AOC.135\(a\)\(4\)](#).

GM1 ORO.AOC.135(a)(4) Personnel requirements

ED Decision 2022/017/R

NOMINATED PERSON RESPONSIBLE FOR THE MANAGEMENT AND SUPERVISION OF THE CONTRACT WITH A CAMO PURSUANT TO POINT M.A.201(ea)

If the operator concludes a contract with a CAMO pursuant to point M.A.201(ea) of Annex I (Part-M) to [Regulation \(EU\) No 1321/2014](#), the person nominated by the operator in accordance with point [ORO.AOC.135\(a\)\(4\)](#) is responsible for ensuring that both the operator and CAMO fulfil their obligations as specified in the contract (which is established in accordance with Appendix I to Part-M). In the particular context of a single air carrier business grouping, that person is expected to apply critical thinking, to be impartial, and not complacent about the fact that the CAMO belongs to that business grouping.

ORO.AOC.140 Facility requirements

Regulation (EU) No 965/2012

In accordance with [ORO.GEN.215](#), the operator shall:

- (a) make use of appropriate ground handling facilities to ensure the safe handling of its flights;
- (b) arrange operational support facilities at the main operating base, appropriate for the area and type of operation; and
- (c) ensure that the available working space at each operating base is sufficient for personnel whose actions may affect the safety of flight operations. Consideration shall be given to the needs of ground crew, personnel concerned with operational control, the storage and display of essential records and flight planning by crews.

GM1 ORO.AOC.140(b);(c) Facility requirements

ED Decision 2014/017/R

VFR DAY OPERATIONS WITH AEROPLANES WITH A MOPSC OF LESS THAN 7 AND HELICOPTERS WITH A MOPSC OF LESS THAN 5 TAKING OFF AND LANDING AT THE SAME AERODROME OR OPERATING SITE

Taking into account the size of the operator and the type of operations, appropriate facilities may consist in arrangements for:

- (a) suitable office accommodation for the nominated person(s), as requested by [ORO.AOC.135](#), and
- (b) adequate working space for the flight preparation to be performed by the flight crew.

ORO.AOC.150 Documentation requirements

Regulation (EU) No 965/2012

- (a) The operator shall make arrangements for the production of manuals and any other documentation required and associated amendments.
- (b) The operator shall be capable of distributing operational instructions and other information without delay.

SUBPART DEC: DECLARATION

ORO.DEC.100 Declaration

Regulation (EU) No 379/2014

The operator of complex motor-powered aircraft engaged in non-commercial operations or non-commercial specialised operations, and the commercial specialised operator shall:

- (a) provide the competent authority with all relevant information prior to commencing operations, using the form contained in [Appendix I](#) to this Annex;
- (b) notify to the competent authority a list of the alternative means of compliance used;
- (c) maintain compliance with the applicable requirements and with the information given in the declaration;
- (d) notify the competent authority without delay of any changes to its declaration or the means of compliance it uses through submission of an amended declaration using the form contained in [Appendix I](#) to this Annex; and
- (e) notify the competent authority when it ceases operation.

GM1 ORO.DEC.100 Declaration

ED Decision 2014/017/R

GENERAL

The intent of the declaration is to:

- (a) have the operator acknowledge its responsibilities under the applicable safety regulations and that it holds all necessary approvals;
- (b) inform the competent authority of the existence of an operator; and
- (c) enable the competent authority to fulfil its oversight responsibilities in accordance with [ARO.GEN.300](#) and 305.

MANAGED OPERATIONS

When the non-commercial operation of a complex motor-powered aircraft is managed by a third party on behalf of the owner, that party may be the operator in the sense of Article 3(h) of Regulation (EC) No 216/2008, and therefore has to declare its capability and means to discharge the responsibilities associated with the operation of the aircraft to the competent authority.

In such a case, it should also be assessed whether the third party operator undertakes a commercial operation in the sense of Article 3(i) of Regulation (EC) 216/2008.

AMC1 ORO.DEC.100(a);(d) Declaration

ED Decision 2022/012/R

RELEVANT INFORMATION PRIOR TO COMMENCING OPERATION, AND NOTIFICATION OF ANY CHANGES TO DECLARATION — EFVS 200 OPERATIONS

Declarations involving EFVS 200 operations (under [NCC.OP.235](#) or [SPO.OP.235](#)) should be submitted at least 60 days before the new declaration or any change becomes effective, and indicate the date as of which they would apply.

GM1 ORO.DEC.100(a);(d) Declaration

ED Decision 2022/012/R

RELEVANT INFORMATION PRIOR TO COMMENCING OPERATION, AND NOTIFICATION OF ANY CHANGES TO DECLARATION — EFVS 200 OPERATIONS

- (a) When a declaration involves EFVS 200 operations in accordance with [NCC.OP.235](#) or [SPO.OP.235](#), the competent authority should be enabled to fulfil its responsibilities in accordance with [ARO.GEN.345](#) prior to starting these operations or implementing changes to such EFVS 200 operations.
- (b) In accordance with [ORO.DEC.100](#) points (a) and (d), the operator shall provide all relevant information and notify any changes. In relation to EFVS 200, this may be but is not limited to:
 - (1) AFM or additional data from the TC/STC holder;
 - (2) established relevant aerodrome operating minima;
 - (3) documented operating procedures;
 - (4) training and checking programmes;
 - (5) minimum equipment list (MEL) for the operations to be undertaken; and
 - (6) processes to ensure that only runways and instrument procedures suitable for the intended operations are used.

AMC1 ORO.DEC.100(d) Declaration

ED Decision 2014/017/R

CHANGES

The new declaration should be submitted before the change becomes effective indicating the date as of which the change would apply.

SUBPART SPO: COMMERCIAL SPECIALISED OPERATIONS

ORO.SPO.100 Common requirements for commercial specialised operators

Regulation (EU) 2019/1384

- (a) A commercial specialised operator shall in addition to [ORO.DEC.100](#) also comply with [ORO.AOC.135](#), [ORO.AOC.140](#) and [ORO.AOC.150](#).
- (b) Aircraft shall have a certificate of airworthiness (CofA) in accordance with Regulation (EU) No 748/2012 or shall be leased-in in accordance with (c).
- (c) A commercial specialised operator shall obtain prior approval of the competent authority and comply with the following conditions:
 - (1) for wet leasing-in an aircraft of a third-country operator:
 - (i) that the safety standards of a third-country operator with regard to continuing airworthiness and air operations are equivalent to the applicable requirements established by Regulation (EU) No 1321/2014¹ and this Regulation;
 - (ii) that the aircraft of a third-country operator has a standard CofA issued in accordance with Annex 8 to the Convention on International Civil Aviation;
 - (iii) that the duration of the wet lease-in does not exceed seven months in any 12 consecutive month period;
 - (2) for dry leasing-in an aircraft registered in a third country:
 - (i) that an operational need that cannot be satisfied through leasing an aircraft registered in the Union has been identified;
 - (ii) that the duration of the dry lease-in does not exceed seven months in any 12 consecutive month period;
 - (iii) that the safety standards of the third-country aircraft with regard to continuing airworthiness are equivalent to the applicable requirements established by Regulation (EU) No 1321/2014;
 - (iv) that the aircraft is equipped in accordance with Annex VIII (Part SPO).

AMC1 ORO.SPO.100(a) Personnel requirements

ED Decision 2014/017/R

NOMINATED PERSONS

- (a) The person may hold more than one of the nominated posts if such an arrangement is considered suitable and properly matched to the scale and scope of the commercial specialised operation.
- (b) A description of the functions and the responsibilities of the nominated persons, including their names, should be contained in the operations manual.

¹ Commission Regulation (EU) No 1321/2014 of 26 November 2014 on the continuing airworthiness of aircraft and aeronautical products, parts and appliances, and on the approval of organisations and personnel involved in these tasks (OJ L 362, 17.12.2014, p. 1).

- (c) A commercial specialised operator should make arrangements to ensure continuity of supervision in the absence of nominated persons.
- (d) The person nominated by a commercial specialised operator should normally not be nominated by another commercial specialised operator.
- (e) Persons nominated should be contracted to work sufficient hours to fulfil the management functions associated with the scale and scope of the commercial specialised operation.

AMC2 ORO.SPO.100(a) Personnel requirements

ED Decision 2014/017/R

COMBINATION OF NOMINATED PERSONS RESPONSIBILITIES

- (a) The acceptability of a single person holding several posts, possibly in combination with being the accountable manager, should depend upon the nature and scale of the commercial specialised operation. The two main areas of concern should be competence and an individual's capacity to meet his/her responsibilities.
- (b) As regards competence in different areas of responsibility, there should not be any difference from the requirements applicable to persons holding only one post.
- (c) The capacity of an individual to meet his/her responsibilities should primarily be dependent upon the scale of the commercial specialised operation. However, the complexity of the organisation or of the operation may prevent, or limit, combinations of posts which may be acceptable in other circumstances.
- (d) In most circumstances, the responsibilities of a nominated person should rest with a single individual. However, in the area of ground operations, it may be acceptable for responsibilities to be split, provided that the responsibilities of each individual concerned are clearly defined.

NOMINATED PERSONS

The smallest organisation that can be considered is the one-man organisation where all of the nominated posts are filled by the accountable manager, and audits are conducted by an independent person.

GM2 ORO.SPO.100(a) Personnel requirements

ED Decision 2014/017/R

COMPETENCE OF NOMINATED PERSONS

- (a) Nominated persons in accordance with [ORO.AOC.135](#) should normally be expected to possess the experience and meet the licensing provisions that are listed in (b) to (f). There may be exceptional cases where not all of the provisions can be met. In that circumstance, the nominee should have comparable experience and also the ability to perform effectively the functions associated with the post and with the scale of the specialised operation.
- (b) Nominated persons should have:
 - (1) practical experience and expertise in the application of aviation safety standards and safe operating practices;

- (2) comprehensive knowledge of:
 - (i) the applicable EU safety regulations and any associated requirements and procedures;
 - (ii) the operator's high-risk specialised operation authorisation, if applicable; and
 - (iii) the need for, and content of, the relevant parts of the commercial specialised operator's operations manual;
 - (3) familiarity with management systems preferably in the area of aviation;
 - (4) appropriate management experience, preferably in a comparable organisation; and
 - (5) 5 years of relevant work experience of which at least 2 years should be from the aeronautical industry in an appropriate position.
- (c) Flight operations. The nominated person should hold or have held a valid flight crew licence and the associated ratings appropriate to the type of commercial specialised operations conducted by the operator. In case the nominated person's licence and ratings are not current, his/her deputy should hold a valid flight crew licence and the associated ratings.
- (d) Crew training. The nominated person or his/her deputy should be a current type rating instructor on a type/class operated by the commercial specialised operator. The nominated person should have a thorough knowledge of the operator's crew training concept for flight crew and when relevant other crew.
- (e) Ground operations. The nominated person should have a thorough knowledge of the commercial specialised operator's ground operations concept.
- (f) Continuing airworthiness. The nominated person should have the relevant knowledge and appropriate experience requirements related to aircraft continuing airworthiness as detailed in Part-M¹.

AMC1 ORO.SPO.100(c) Common requirements for commercial specialised operators

ED Decision 2012/017/R

LEASING OF THIRD COUNTRY OPERATOR OR AIRCRAFT — INFORMATION TO BE PROVIDED TO THE COMPETENT AUTHORITY

The operator intending to lease-in an aircraft or operator should provide the competent authority with the following information:

- (a) the aircraft type, registration markings and serial number;
- (b) the name and address of the registered owner;
- (c) a copy of the valid certificate of airworthiness;
- (d) a copy of the lease agreement or description of the lease provisions, except financial arrangements;
- (e) duration of the lease.

¹ Commission Regulation (EC) No 2042/2003 of 20 November 2003 on the continuing airworthiness of aircraft and aeronautical products, parts and appliances, and on the approval of organisations and personnel involved in these tasks (OJ L 315, 28.11.2003, p. 1). Regulation as last amended by Commission Regulation (EU) No 1149/2011 of 21 October 2011 (OJ L 298, 16.11.2011, p. 1).

The information mentioned above should be accompanied by a statement signed by the lessee that the parties to the lease agreement fully understand their respective responsibilities under the applicable regulations.

LEASE AGREEMENTS BETWEEN OPERATORS REGISTERED IN AN EU MEMBER STATE

No approval is required for any lease agreements between operators having their principle place of business in an EU Member State.

AMC1 ORO.SPO.100(c)(1) Common requirements for commercial specialised operators

ED Decision 2014/017/R

WET LEASE-IN OF AN AIRCRAFT REGISTERED IN A THIRD COUNTRY

If the operator is not intending to apply EU safety requirements for air operations and continuing airworthiness when wet leasing-in an aircraft registered in a third country, it should demonstrate to the competent authority that the standards complied with are equivalent to the following requirements:

- (a) Annex VIII (Part-SPO);
- (b) Part-ORO:
 - (1) [ORO.GEN.110](#) and Section 2 of Subpart GEN;
 - (2) ORO.MLR, excluding [ORO.MLR.105](#);
 - (3) ORO.FC;
- (c) Annex V (Part-SPA), if applicable;
- (d) for continuing airworthiness management of the third country operator, Part-M¹ Subpart-B, Subpart-C and Subpart-G, excluding M.A.707, and M.A.710;
- (e) for the maintenance organisation used by the third country operator during the lease period: Part-145²; and
- (f) the operator should provide the competent authority with a full description of the operating procedures and safety assessment demonstrating compliance with the requirements safety objectives set out in points (b) (1)-(3).

¹ Commission Regulation (EC) No 2042/2003 of 20 November 2003 on the continuing airworthiness of aircraft and aeronautical products, parts and appliances, and on the approval of organisations and personnel involved in these tasks (OJ L 315, 28.11.2003, p. 1). Regulation as last amended by Commission Regulation (EU) No 1149/2011 of 21 October 2011 (OJ L 298, 16.11.2011, p. 1).

² Commission Regulation (EC) No 2042/2003 of 20 November 2003 on the continuing airworthiness of aircraft and aeronautical products, parts and appliances, and on the approval of organisations and personnel involved in these tasks (OJ L 315, 28.11.2003, p. 1). Regulation as last amended by Commission Regulation (EU) No 1149/2011 of 21 October 2011 (OJ L 298, 16.11.2011, p. 1).

AMC2 ORO.SPO.100(c)(1) Common requirements for commercial specialised operators

ED Decision 2014/017/R

WET LEASE-IN

The lessee should maintain a record of occasions when lessors are used, for inspection by the competent authority.

GM1 ORO.SPO.100(c)(1) Common requirements for commercial specialised operators

ED Decision 2014/017/R

SHORT-TERM WET LEASE-IN

In anticipation of an operational need the operator may enter into a framework agreement with more than one third country operator provided that these operators comply with [ORO.SPO.110\(c\)](#). These third country operators should be placed in a list maintained by the lessee.

ORO.SPO.110 Authorisation of high risk commercial specialised operations

Regulation (EU) No 379/2014

- (a) A commercial specialised operator shall apply for and obtain an authorisation issued by the competent authority of the operator prior to commencing a high risk commercial specialised operation:
 - (1) that is carried out over an area where the safety of third parties on the ground is likely to be endangered in the event of an emergency, or
 - (2) that, as determined by the competent authority of the place where the operation is conducted, due to its specific nature and the local environment in which it is conducted, poses a high risk, in particular to third parties on the ground.
- (b) The operator shall provide the following information to the competent authority:
 - (1) the official name and business name, address, and mailing address of the applicant;
 - (2) a description of the management system, including organisational structure;
 - (3) a description of the proposed operation, including the type(s), and number of aircraft to be operated;
 - (4) the risk assessment documentation and related standard operating procedures, required by [SPO.OP.230](#);
 - (5) a statement that all the documentation sent to the competent authority has been verified by the operator and found in compliance with the applicable requirements.
- (c) The application for an authorisation or its amendment shall be made in a form and manner established by the competent authority, taking into account the applicable requirements of Regulation (EC) No 216/2008 and its Implementing Rules.

GM1 ORO.SPO.110(a) Authorisation of high-risk commercial specialised operations

ED Decision 2014/017/R

DECLARATION/AUTHORISATION

Any commercial specialised operator should declare its activity to its competent authority, as required by [ORO.DEC.100](#).

GM2 ORO.SPO.110(a) Authorisation of high-risk commercial specialised operations

ED Decision 2014/017/R

VALIDITY OF THE AUTHORISATION

The operator may submit an application to its competent authority for a single event, a defined series of flights or for an unlimited duration, depending on the type of operations foreseen.

ORO.SPO.115 Changes

Regulation (EU) No 379/2014

- (a) Any change affecting the scope of the authorisation or the authorised operations shall require prior approval of the competent authority. Any change not covered by the initial risk assessment, shall require the submission of an amended risk assessment and SOP to the competent authority.
- (b) The application for approval of a change shall be submitted before any such change takes place, in order to enable the competent authority to determine continued compliance with Regulation (EC) No 216/2008 and its Implementing Rules and to amend, if necessary, the authorisation. The operator shall provide the competent authority with any relevant documentation.
- (c) The change shall only be implemented upon receipt of formal approval by the competent authority in accordance with [ARO.OPS.150](#).
- (d) The operator shall operate under the conditions prescribed by the competent authority during such changes, as applicable.

GM1 ORO.SPO.115(a) Changes

ED Decision 2014/017/R

GENERAL

Any change to information contained in the authorisation, but not leading to an amendment of the SOPs or the operator's risk assessment should be notified by the commercial specialised operator to its competent authority which should amend the authorisation.

ORO.SPO.120 Continued validity

Regulation (EU) No 379/2014

- (a) An operator holding a specialised operation authorisation shall comply with the scope and privileges defined in the authorisation.

- (b) The operator's authorisation shall remain valid subject to:
- (1) the operator remaining in compliance with the relevant requirements of Regulation (EC) No 216/2008 and its Implementing Rules, taking into account the provisions related to the handling of findings as specified under [ORO.GEN.150](#);
 - (2) the competent authority being granted access to the operator as defined in [ORO.GEN.140](#) to determine continued compliance with the relevant requirements of Regulation (EC) No 216/2008 and its Implementing Rules; and
 - (3) the authorisation not being surrendered or revoked.
- (c) Upon revocation or surrender the authorisation shall be returned to the competent authority without delay.

SUBPART MLR: MANUALS, LOGS AND RECORDS

ORO.MLR.100 Operations manual – general

Regulation (EU) No 379/2014

- (a) The operator shall establish an operations manual (OM) as specified under 8.b of Annex IV to Regulation (EC) No 216/2008.
- (b) The content of the OM shall reflect the requirements set out in this Annex, Annex IV (Part-CAT), Annex V (Part-SPA), Annex VI (Part-NCC) and Annex VIII (Part-SPO), as applicable, and shall not contravene the conditions contained in the operations specifications to the air operator certificate (AOC), the SPO authorisation or the declaration and the list of specific approvals, as applicable.
- (c) The OM may be issued in separate parts.
- (d) All operations personnel shall have easy access to the portions of the OM that are relevant to their duties.
- (e) The OM shall be kept up to date. All personnel shall be made aware of the changes that are relevant to their duties.
- (f) Each crew member shall be provided with a personal copy of the relevant sections of the OM pertaining to their duties. Each holder of an OM, or appropriate parts of it, shall be responsible for keeping their copy up to date with the amendments or revisions supplied by the operator.
- (g) For AOC holders:
 - (1) for amendments required to be notified in accordance with [ORO.GEN.115\(b\)](#) and [ORO.GEN.130\(c\)](#), the operator shall supply the competent authority with intended amendments in advance of the effective date; and
 - (2) for amendments to procedures associated with prior approval items in accordance with [ORO.GEN.130](#), approval shall be obtained before the amendment becomes effective.
- (g1) For SPO authorisation holders, any amendment associated with the authorised standard operating procedures, prior approval shall be obtained before the amendment becomes effective.
- (h) Notwithstanding (g) and (g1), when immediate amendments or revisions are required in the interest of safety, they may be published and applied immediately, provided that any approval required has been applied for.
- (i) The operator shall incorporate all amendments and revisions required by the competent authority.
- (j) The operator shall ensure that information taken from approved documents, and any amendment thereof, is correctly reflected in the OM. This does not prevent the operator from publishing more conservative data and procedures in the OM.
- (k) The operator shall ensure that all personnel are able to understand the language in which those parts of the OM which pertain to their duties and responsibilities are written. The content of the OM shall be presented in a form that can be used without difficulty and observes human factors principles.

AMC1 ORO.MLR.100 Operations manual – general

ED Decision 2014/017/R

GENERAL

- (a) The operations manual (OM) may vary in detail according to the complexity of the operation and of the type and number of aircraft operated.
- (b) The OM or parts thereof may be presented in any form, including electronic form. In all cases, the accessibility, usability and reliability should be assured.
- (c) The OM should be such that:
 - (1) all parts of the manual are consistent and compatible in form and content;
 - (2) the manual can be readily amended; and
 - (3) the content and amendment status of the manual is controlled and clearly indicated.
- (d) The OM should include a description of its amendment and revision process specifying:
 - (1) the person(s) who may approve amendments or revisions;
 - (2) the conditions for temporary revisions and/or immediate amendments or revision required in the interest of safety; and
 - (3) the methods by which operator personnel are advised of the changes.
- (e) The OM content may be based on, or may refer to, industry codes of practice.
- (f) When compiling an OM, the operator may take advantage of the contents of other relevant documents. Material produced by the operator for the type-related part of the OM may be supplemented with, or substituted by, applicable parts of the aircraft flight manual (AFM) or, where such a document exists, by an aircraft operating manual produced by the manufacturer of the aircraft.
- (g) In the case of commercial operations with other-than-complex motor-powered aircraft or non-commercial operations, a 'pilot operating handbook' (POH), or equivalent document, may be used as the type-related part of the OM, provided that the POH covers the normal and abnormal/emergency operating procedures.
- (h) For the route and aerodrome part of the OM, material produced by the operator may be supplemented with or substituted by applicable route guide material produced by a specialist company.
- (i) If the operator chooses to use material from another source in the OM, either the applicable material should be copied and included directly in the relevant part of the OM, or the OM should contain a reference to the appropriate section of that applicable material.
- (j) If the operator chooses to make use of material from another source (e.g. a route manual producer, an aircraft manufacturer or a training organisation), this does not absolve the operator from the responsibility of verifying the applicability and suitability of this material. Any material received from an external source should be given its status by a statement in the OM.

AMC2 ORO.MLR.100 Operations manual – General

ED Decision 2017/007/R

CONTENTS OF THE OPERATIONS MANUAL FOR CERTAIN TYPES OF OPERATION

For non-commercial operations with complex motor-powered aircraft, or CAT operations with either single-engined propeller-driven aeroplanes with an MOPSC of 5 or less, or single-engined non-complex helicopters with an MOPSC of 5 or less, taking off and landing at the same aerodrome or operating site, under VFR by day, the OM should contain at least the following information, where applicable:

- (a) Table of contents;
- (b) Amendment control status and list of effective pages or paragraphs, unless the entire manual is re-issued and the manual has an effective date on it;
- (c) Duties, responsibilities and succession of management and operating personnel;
- (d) Description of the management system;
- (e) Operational control system;
- (f) Flight time limitations;
- (g) Standard operating procedures (SOPs);
- (h) Weather limitations;
- (i) Emergency procedures;
- (j) Accidents/incidents considerations;
- (k) Security procedures;
- (l) Minimum equipment list (MEL);
- (m) Personnel qualifications and training;
- (n) Record-keeping;
- (o) Normal flight operations;
- (p) Performance operating limitations;
- (q) Procedures for the preservation of recordings of the flight recorders in order to prevent inadvertent reactivation, repair or reinstallation of the flight recorders following an accident or a serious incident or when this preservation is directed by the investigating authority;
- (r) Handling of dangerous goods.

AMC3 ORO.MLR.100 Operations manual – general

ED Decision 2022/005/R

CONTENTS — CAT OPERATIONS

- (a) The OM should contain at least the following information, where applicable, as relevant for the area and type of operation:

A GENERAL/BASIC**0 ADMINISTRATION AND CONTROL OF THE OPERATIONS MANUAL****0.1 Introduction:**

- (a) A statement that the manual complies with all applicable regulations and with the terms and conditions of the applicable AOC.
- (b) A statement that the manual contains operational instructions that are to be complied with by the relevant personnel.
- (c) A list and brief description of the various parts, their contents, applicability and use.
- (d) Explanations and definitions of terms and words needed for the use of the manual.

0.2 System of amendment and revision:

- (a) Details of the person(s) responsible for the issuance and insertion of amendments and revisions.
- (b) A record of amendments and revisions with insertion dates and effective dates.
- (c) A statement that handwritten amendments and revisions are not permitted, except in situations requiring immediate amendment or revision in the interest of safety.
- (d) A description of the system for the annotation of pages or paragraphs and their effective dates.
- (e) A list of effective pages or paragraphs.
- (f) Annotation of changes (in the text and, as far as practicable, on charts and diagrams).
- (g) Temporary revisions.
- (h) A description of the distribution system for the manuals, amendments and revisions.

1 ORGANISATION AND RESPONSIBILITIES

- 1.1 Organisational structure. A description of the organisational structure, including the general organogram and operations departments' organograms. The organogram should depict the relationship between the operations departments and the other departments of the operator. In particular, the subordination and reporting lines of all divisions, departments, etc., which pertain to the safety of flight operations, should be shown.
- 1.2 Nominated persons. The name of each nominated person responsible for flight operations, crew training and ground operations, as prescribed in [ORO.AOC.135](#). A description of their function and responsibilities should be included.
- 1.3 Responsibilities and duties of operations management personnel. A description of the duties, responsibilities and authority of operations

management personnel pertaining to the safety of flight operations and the compliance with the applicable regulations.

- 1.4 Authority, duties and responsibilities of the pilot-in-command/commander. A statement defining the authority, duties and responsibilities of the pilot-in-command/commander.
- 1.5 Duties and responsibilities of crew members other than the pilot-in-command/commander.

2 OPERATIONAL CONTROL AND SUPERVISION

- 2.1 Supervision of the operation by the operator. A description of the system for supervision of the operation by the operator (see [ORO.GEN.110\(c\)](#)). This should show how the safety of flight operations and the qualifications of personnel are supervised. In particular, the procedures related to the following items should be described:
 - (a) licence and qualification validity,
 - (b) competence of operations personnel,
 - (c) control, analysis and storage of the required records.
- 2.2 System and responsibility for promulgation of additional operational instructions and information. A description of any system for promulgating information which may be of an operational nature, but which is supplementary to that in the OM. The applicability of this information and the responsibilities for its promulgation should be included.
- 2.3 Operational control. A description of the procedures and responsibilities necessary to exercise operational control with respect to flight safety.
- 2.4 Powers of the authority. A description of the powers of the competent authority and guidance to staff on how to facilitate inspections by authority personnel.

3 MANAGEMENT SYSTEM

A description of the management system, including at least the following:

- (a) safety policy;
- (b) the process for identifying safety hazards and for evaluating and managing the associated risks;
- (c) compliance monitoring system;
- (d) allocation of duties and responsibilities;
- (e) documentation of all key management system processes.

4 CREW COMPOSITION

- 4.1 Crew composition. An explanation of the method for determining crew compositions, taking account of the following:
 - (a) the type of aircraft being used;
 - (b) the area and type of operation being undertaken;
 - (c) the phase of the flight;

- (d) the minimum crew requirement and flight duty period planned;
 - (e) experience (total and on type), recency and qualification of the crew members;
 - (f) the designation of the pilot-in-command/commander and, if necessitated by the duration of the flight, the procedures for the relief of the pilot-in-command/commander or other members of the flight crew (see [ORO.FC.105](#));
 - (g) the designation of the senior cabin crew member and, if necessitated by the duration of the flight, the procedures for the relief of the senior cabin crew member and any other member of the cabin crew.
- 4.2 Designation of the pilot-in-command/commander. The rules applicable to the designation of the pilot-in-command/commander.
- 4.3 Flight crew incapacitation. Instructions on the succession of command in the event of flight crew incapacitation.
- 4.4 Operation on more than one type. A statement indicating which aircraft are considered as one type for the purpose of:
 - (a) flight crew scheduling; and
 - (b) cabin crew scheduling.
- 5 QUALIFICATION REQUIREMENTS
 - 5.1 A description of the required licence, rating(s), qualification/competency (e.g. for routes and aerodromes), experience, training, checking and recency for operations personnel to conduct their duties. Consideration should be given to the aircraft type, kind of operation and composition of the crew.
 - 5.2 Flight crew:
 - (a) pilot-in-command/commander,
 - (b) pilot relieving the pilot-in-command/commander,
 - (c) co-pilot,
 - (d) pilot relieving the co-pilot,
 - (e) pilot under supervision,
 - (f) system panel operator,
 - (g) operation on more than one type or variant.
 - 5.3 Cabin crew:
 - (a) senior cabin crew member,
 - (b) cabin crew member:
 - (i) required cabin crew member,
 - (ii) additional cabin crew member and cabin crew member during familiarisation flights,
 - (c) operation on more than one type or variant.

-
- 5.4 Training, checking and supervision personnel:
- (a) for flight crew; and
 - (b) for cabin crew.
- 5.5 Other operations personnel (including technical crew and crew members other than flight, cabin and technical crew).
- 6 CREW HEALTH PRECAUTIONS
- 6.1 Crew health precautions. The relevant regulations and guidance to crew members concerning health, including the following:
- (a) alcohol and other intoxicating liquids,
 - (b) narcotics,
 - (c) drugs,
 - (d) sleeping tablets,
 - (e) anti-depressants,
 - (f) pharmaceutical preparations,
 - (g) immunisation,
 - (h) deep-sea diving,
 - (i) blood/bone marrow donation,
 - (j) meal precautions prior to and during flight,
 - (k) sleep and rest,
 - (l) surgical operations.
- 7 FLIGHT TIME LIMITATIONS
- 7.1 Flight and duty time limitations and rest requirements.
- 7.2 Exceedance of flight and duty time limitations and/or reductions of rest periods. Conditions under which flight and duty time may be exceeded or rest periods may be reduced, and the procedures used to report these modifications.
- 7.3 A description of the fatigue risk management, including at least the following:
- (a) the philosophy and principles;
 - (b) documentation of processes;
 - (c) scientific principles and knowledge;
 - (d) hazard identification and risk assessment processes;
 - (e) risk mitigation process;
 - (f) FRM safety assurance processes; and
 - (g) FRM promotion processes.

8 OPERATING PROCEDURES

8.1 Flight preparation instructions. As applicable to the operation:

8.1.1 Minimum flight altitudes. A description of the method of determination and application of minimum altitudes including:

- (a) a procedure to establish the minimum altitudes/flight levels for visual flight rules (VFR) flights; and
- (b) a procedure to establish the minimum altitudes/flight levels for instrument flight rules (IFR) flights.

8.1.2 Criteria and responsibilities for determining the adequacy of aerodromes to be used.

8.1.3 Methods and responsibilities for establishing aerodrome operating minima. Reference should be made to procedures for the determination of the visibility and/or runway visual range (RVR) and for the applicability of the actual visibility observed by the pilots, the reported visibility and the reported RVR.

8.1.4 En-route operating minima for VFR flights or VFR portions of a flight and, where single-engined aircraft are used, instructions for route selection with respect to the availability of surfaces that permit a safe forced landing.

8.1.5 Presentation and application of aerodrome and en-route operating minima.

8.1.6 Interpretation of meteorological information. Explanatory material on the decoding of meteorological (MET) forecasts and MET reports relevant to the area of operations, including the interpretation of conditional expressions.

8.1.7 Determination of the quantities of fuel, oil and water methanol carried. The methods by which the quantities of fuel, oil and water methanol to be carried are determined and monitored in-flight. This section should also include instructions on the measurement and distribution of the fluid carried on board. Such instructions should take account of all circumstances likely to be encountered on the flight, including the possibility of in-flight re-planning and of failure of one or more of the aircraft's power plants. The system for maintaining fuel and oil records should also be described.

8.1.8 Mass and centre of gravity. The general principles of mass and centre of gravity including the following:

- (a) definitions;
- (b) methods, procedures and responsibilities for preparation and acceptance of mass and centre of gravity calculations;
- (c) the policy for using standard and/or actual masses;
- (d) the method for determining the applicable passenger, baggage and cargo mass;

- (e) the applicable passenger and baggage masses for various types of operations and aircraft type;
- (f) general instructions and information necessary for verification of the various types of mass and balance documentation in use;
- (g) last-minute changes procedures;
- (h) specific gravity of fuel, oil and water methanol;
- (i) seating policy/procedures;
- (j) for helicopter operations, standard load plans.

8.1.9 Air traffic services (ATS) flight plan. Procedures and responsibilities for the preparation and submission of the ATS flight plan. Factors to be considered include the means of submission for both individual and repetitive flight plans.

8.1.10 Operational flight plan. Procedures and responsibilities for the preparation and acceptance of the operational flight plan. The use of the operational flight plan should be described, including samples of the operational flight plan formats in use.

8.1.11 Operator's aircraft technical log. The responsibilities and the use of the operator's aircraft technical log should be described, including samples of the format used.

8.1.12 List of documents, forms and additional information to be carried.

8.1.13 For commercial air transport operations with single-engined turbine aeroplanes in instrument meteorological conditions or at night (CAT SET-IMC) approved in accordance with Subpart L (SET-IMC) of Annex V (Part-SPA) to Regulation (EU) No 965/2012:

- (a) the procedure for route selection with respect to the availability of surfaces, which permits a safe forced landing;
- (b) the instructions for the assessment of landing sites (elevation, landing direction, and obstacles in the area); and
- (c) the instructions for the assessment of the weather conditions at those landing sites.

8.2 Ground handling instructions. As applicable to the operation:

8.2.1 Fuelling procedures. A description of fuelling procedures, including:

- (a) safety precautions during refuelling and defuelling including when an aircraft auxiliary power unit is in operation or, for helicopters, when rotors are turning or, for aeroplanes, when an engine is running;
- (b) refuelling and defuelling when passengers are embarking, on board or disembarking; and
- (c) precautions to be taken to avoid mixing fuels.

8.2.2 Aircraft, passengers and cargo handling procedures related to safety. A description of the handling procedures to be used when allocating seats, embarking and disembarking passengers and when loading and unloading the aircraft. Further procedures, aimed at achieving safety whilst the aircraft is on the ramp, should also be given. Handling procedures should include:

- (a) special categories of passengers, including children/infants, persons with reduced mobility, inadmissible passengers, deportees and persons in custody;
- (b) permissible size and weight of hand baggage;
- (c) loading and securing of items in the aircraft;
- (d) positioning of ground equipment;
- (e) operation of aircraft doors;
- (f) safety on the aerodrome/operating site, including fire prevention and safety in blast and suction areas;
- (g) start-up, ramp departure and arrival procedures, including, for aeroplanes, push-back and towing operations;
- (h) servicing of aircraft;
- (i) documents and forms for aircraft handling;
- (j) special loads and classification of load compartments; and
- (k) multiple occupancy of aircraft seats.

8.2.3 Procedures for the refusal of embarkation. Procedures to ensure that persons who appear to be intoxicated, or who demonstrate by manner or physical indications that they are under the influence of drugs, are refused embarkation. This does not apply to medical patients under proper care.

8.2.4 De-icing and anti-icing on the ground. A description of the de-icing and anti-icing policy and procedures for aircraft on the ground. These should include descriptions of the types and effects of icing and other contaminants on aircraft whilst stationary, during ground movements and during take-off. In addition, a description of the fluid types used should be given, including the following:

- (a) proprietary or commercial names,
- (b) characteristics,
- (c) effects on aircraft performance,
- (d) hold-over times,
- (e) precautions during usage.

8.3 Flight Procedures:

8.3.1 VFR/IFR Policy. A description of the policy for allowing flights to be made under VFR, or for requiring flights to be made under IFR, or for changing from one to the other.

8.3.2 Navigation Procedures. A description of all navigation procedures, relevant to the type(s) and area(s) of operation. Special consideration should be given to:

- (a) standard navigational procedures, including policy for carrying out independent cross-checks of keyboard entries where these affect the flight path to be followed by the aircraft; and
- (b) required navigation performance (RNP), minimum navigation performance specification (MNPS) and polar navigation and navigation in other designated areas;
- (c) in-flight re-planning;
- (d) procedures in the event of system degradation; and
- (e) reduced vertical separation minima (RVSM), for aeroplanes.

8.3.3 Altimeter setting procedures, including, where appropriate, use of:

- (a) metric altimetry and conversion tables; and
- (b) QFE operating procedures.

8.3.4 Altitude alerting system procedures for aeroplanes or audio voice alerting devices for helicopters.

8.3.5 Ground proximity warning system (GPWS)/terrain avoidance warning system (TAWS), for aeroplanes. Procedures and instructions required for the avoidance of controlled flight into terrain, including limitations on high rate of descent near the surface (the related training requirements are covered in OM-D 2.1).

8.3.6 Policy and procedures for the use of traffic collision avoidance system (TCAS)/airborne collision avoidance system (ACAS) for aeroplanes and, when applicable, for helicopters.

8.3.7 Policy and procedures for in-flight fuel management.

8.3.8 Adverse and potentially hazardous atmospheric conditions. Procedures for operating in, and/or avoiding, adverse and potentially hazardous atmospheric conditions, including the following:

- (a) thunderstorms,
- (b) icing conditions,
- (c) turbulence,
- (d) windshear,
- (e) jet stream,
- (f) volcanic ash clouds,
- (g) heavy precipitation,
- (h) sand storms,
- (i) mountain waves,
- (j) significant temperature inversions.

- 8.3.9 Wake turbulence. Wake turbulence separation criteria, taking into account aircraft types, wind conditions and runway/final approach and take-off area (FATO) location. For helicopters, consideration should also be given to rotor downwash.
- 8.3.10 Crew members at their stations. The requirements for crew members to occupy their assigned stations or seats during the different phases of flight or whenever deemed necessary in the interest of safety and, for aeroplane operations, including procedures for controlled rest in the flight crew compartment.
- 8.3.11 Use of restraint devices for crew and passengers. The requirements for crew members and passengers to use safety belts and/or restraint systems during the different phases of flight or whenever deemed necessary in the interest of safety.
- 8.3.12 Admission to flight crew compartment. The conditions for the admission to the flight crew compartment of persons other than the flight crew. The policy regarding the admission of inspectors from an authority should also be included.
- 8.3.13 Use of vacant crew seats. The conditions and procedures for the use of vacant crew seats.
- 8.3.14 Incapacitation of crew members. Procedures to be followed in the event of incapacitation of crew members in-flight. Examples of the types of incapacitation and the means for recognising them should be included.
- 8.3.15 Cabin safety requirements. Procedures:
- (a) covering cabin preparation for flight, in-flight requirements and preparation for landing, including procedures for securing the cabin and galleys;
 - (b) to ensure that passengers are seated where, in the event that an emergency evacuation is required, they may best assist and not hinder evacuation from the aircraft;
 - (c) to be followed during passenger embarkation and disembarkation;
 - (d) when refuelling/defuelling with passengers embarking, on board or disembarking;
 - (e) covering the carriage of special categories of passengers;
 - (f) covering smoking on board;
 - (g) covering the handling of suspected infectious diseases.
- 8.3.16 Passenger briefing procedures. The contents, means and timing of passenger briefing in accordance with Annex IV (Part-CAT).
- 8.3.17 Procedures for aircraft operated whenever required cosmic or solar radiation detection equipment is carried.
- 8.3.18 Policy on the use of autopilot and autothrottle for aircraft fitted with these systems.

- 8.4 Low visibility operations (LVO). A description of the operational procedures associated with LVO.
- 8.5 Extended-range operations with two-engined aeroplanes (ETOPS). A description of the ETOPS operational procedures. (Refer to EASA AMC 20-6)
- 8.6 Use of the minimum equipment and configuration deviation list(s).
- 8.7 Non-commercial operations. Information as required by [ORO.AOC.125](#) for each type of non-commercial flight performed by the AOC holder. A description of the differences from CAT operations. Procedures and limitations, for example, for the following:
 - (a) training flights,
 - (b) flights at the end of lease or upon transfer of ownership,
 - (c) delivery flights,
 - (d) ferry flights,
 - (e) demonstration flights,
 - (f) positioning flights,
 - (g) other non-commercial flights.
- 8.8 Oxygen requirements:
 - 8.8.1 An explanation of the conditions under which oxygen should be provided and used.
 - 8.8.2 The oxygen requirements specified for the following persons:
 - (a) flight crew;
 - (b) cabin crew;
 - (c) passengers.
- 8.9 Procedures related to the use of type B EFB applications.

9 DANGEROUS GOODS AND WEAPONS

- 9.1 Information, instructions and general guidance on the transport of dangerous goods, in accordance with Subpart G of Annex V (SPA.DG), including:
 - (a) operator's policy on the transport of dangerous goods;
 - (b) guidance on the requirements for acceptance, labelling, handling, stowage and segregation of dangerous goods;
 - (c) special notification requirements in the event of an accident or occurrence when dangerous goods are being carried;
 - (d) procedures for responding to emergency situations involving dangerous goods;
 - (e) duties of all personnel involved; and
 - (f) instructions on the carriage of the operator's personnel on cargo aircraft when dangerous goods are being carried.

- 9.2 The conditions under which weapons, munitions of war and sporting weapons may be carried.

10 SECURITY

Security instructions, guidance, procedures, training and responsibilities, taking into account Regulation (EC) No 300/2008¹. Some parts of the security instructions and guidance may be kept confidential.

11 HANDLING, NOTIFYING AND REPORTING ACCIDENTS, INCIDENTS AND OCCURRENCES AND USING THE CVR RECORDING

Procedures for handling, notifying and reporting accidents, incidents and occurrences. This section should include the following:

- (a) definition of accident, incident and occurrence and of the relevant responsibilities of all persons involved;
- (b) illustrations of forms to be used for reporting all types of accident, incident and occurrence (or copies of the forms themselves), instructions on how they are to be completed, the addresses to which they should be sent and the time allowed for this to be done;
- (c) in the event of an accident, descriptions of which departments, authorities and other organisations have to be notified, how this will be done and in what sequence;
- (d) procedures for verbal notification to air traffic service units of incidents involving ACAS resolution advisories (RAs), bird hazards, dangerous goods and hazardous conditions;
- (e) procedures for submitting written reports on air traffic incidents, ACAS RAs, bird strikes, dangerous goods incidents or accidents, and unlawful interference;
- (f) reporting procedures. These procedures should include internal safety-related reporting procedures to be followed by crew members, designed to ensure that the pilot-in-command/commander is informed immediately of any incident that has endangered, or may have endangered, safety during the flight, and that the pilot-in-command/commander is provided with all relevant information.
- (g) Procedures for the preservation of recordings of the flight recorders following an accident or a serious incident or when so directed by the investigating authority. These procedures should include:
 - (1) a full quotation of point (a) of [CAT.GEN.MPA.195](#); and
 - (2) instructions and means to prevent inadvertent reactivation, repair or reinstallation of the flight recorders by personnel of the operator or of third parties, and to ensure that flight recorder recordings are preserved for the needs of the investigating authority.

¹ OJ L 97, 11.3.2008, p. 72.

- (h) Procedures required by [CAT.GEN.MPA.195](#) for using the CVR recording or its transcript without prejudice to Regulation (EU) No 996/210, when applicable.

12 RULES OF THE AIR

- (a) Visual and instrument flight rules,
- (b) Territorial application of the rules of the air,
- (c) Communication procedures, including communication-failure procedures,
- (d) Information and instructions relating to the interception of civil aircraft,
- (e) The circumstances in which a radio listening watch is to be maintained,
- (f) Signals,
- (g) Time system used in operation,
- (h) ATC clearances, adherence to flight plan and position reports,
- (i) Visual signals used to warn an unauthorised aircraft flying in or about to enter a restricted, prohibited or danger area,
- (j) Procedures for flight crew observing an accident or receiving a distress transmission,
- (k) The ground/air visual codes for use by survivors, and description and use of signal aids,
- (l) Distress and urgency signals.

13 LEASING/CODE-SHARE

A description of the operational arrangements for leasing and code-share, associated procedures and management responsibilities.

B AIRCRAFT OPERATING MATTERS — TYPE RELATED

Taking account of the differences between types/classes, and variants of types, under the following headings:

0 GENERAL INFORMATION AND UNITS OF MEASUREMENT

- 0.1 General information (e.g. aircraft dimensions), including a description of the units of measurement used for the operation of the aircraft type concerned and conversion tables.

1 LIMITATIONS

- 1.1 A description of the certified limitations and the applicable operational limitations should include the following:
 - (a) certification status (e.g. EASA (supplemental) type certificate, environmental certification, etc.);
 - (b) passenger seating configuration for each aircraft type, including a pictorial presentation;
 - (c) types of operation that are approved (e.g. VFR/IFR, CAT II/III, RNP, flights in known icing conditions, etc.);
 - (d) crew composition;

- (e) mass and centre of gravity;
- (f) speed limitations;
- (g) flight envelope(s);
- (h) wind limits, including operations on contaminated runways;
- (i) performance limitations for applicable configurations;
- (j) (runway) slope;
- (k) for aeroplanes, limitations on wet or contaminated runways;
- (l) airframe contamination;
- (m) system limitations.

2 NORMAL PROCEDURES

The normal procedures and duties assigned to the crew, the appropriate checklists, the system for their use and a statement covering the necessary coordination procedures between flight and cabin/other crew members. The normal procedures and duties should include the following:

- (a) pre-flight,
- (b) pre-departure,
- (c) altimeter setting and checking,
- (d) taxi, take-off and climb,
- (e) noise abatement,
- (f) cruise and descent,
- (g) approach, landing preparation and briefing,
- (h) VFR approach,
- (i) IFR approach,
- (j) visual approach and circling,
- (k) missed approach,
- (l) normal landing,
- (m) post-landing,
- (n) for aeroplanes, operations on wet and contaminated runways.

3 ABNORMAL AND/OR EMERGENCY PROCEDURES

The abnormal and/or emergency procedures and duties assigned to the crew, the appropriate checklists, the system for their use and a statement covering the necessary coordination procedures between flight and cabin/other crew members. The abnormal and/or emergency procedures and duties should include the following:

- (a) crew incapacitation,
- (b) fire and smoke drills,
- (c) for aeroplanes, un-pressurised and partially pressurised flight,

- (d) for aeroplanes, exceeding structural limits such as overweight landing,
- (e) lightning strikes,
- (f) distress communications and alerting ATC to emergencies,
- (g) engine/burner failure,
- (h) system failures,
- (i) guidance for diversion in case of serious technical failure,
- (j) ground proximity warning, including for helicopters audio voice alerting device (AVAD) warning,
- (k) ACAS/TCAS warning for aeroplanes/audio voice alerting device (AVAD) warning for helicopters,
- (l) windshear,
- (m) emergency landing/ditching,
- (n) for aeroplanes, departure contingency procedures.

4 PERFORMANCE

4.0 Performance data should be provided in a form that can be used without difficulty.

4.1 Performance data. Performance material that provides the necessary data for compliance with the performance requirements prescribed in Annex IV (Part-CAT). For aeroplanes, this performance data should be included to allow the determination of the following:

- (a) take-off climb limits — mass, altitude, temperature;
- (b) take-off field length (for dry, wet and contaminated runway conditions);
- (c) net flight path data for obstacle clearance calculation or, where applicable, take-off flight path;
- (d) the gradient losses for banked climb-outs;
- (e) en-route climb limits;
- (f) approach climb limits;
- (g) landing climb limits;
- (h) landing field length (for dry, wet and contaminated runway conditions) including the effects of an in-flight failure of a system or device, if it affects the landing distance;
- (i) brake energy limits;
- (j) speeds applicable for the various flight stages (also considering dry, wet and contaminated runway conditions).

4.1.1 Supplementary data covering flights in icing conditions. Any certified performance related to an allowable configuration, or configuration deviation, such as anti-skid inoperative.

4.1.2 If performance data, as required for the appropriate performance class, are not available in the AFM, then other data should be included. The OM may contain cross-reference to the data contained in the AFM where such data are not likely to be used often or in an emergency.

4.2 Additional performance data for aeroplanes. Additional performance data, where applicable, including the following:

- (a) all engine climb gradients,
- (b) drift-down data,
- (c) effect of de-icing/anti-icing fluids,
- (d) flight with landing gear down,
- (e) for aircraft with 3 or more engines, one-engine-inoperative ferry flights,
- (f) flights conducted under the provisions of the configuration deviation list (CDL).

5 FLIGHT PLANNING

5.1 Data and instructions necessary for pre-flight and in-flight planning including, for aeroplanes, factors such as speed schedules and power settings. Where applicable, procedures for engine(s)-out operations, ETOPS (particularly the one-engine-inoperative cruise speed and maximum distance to an adequate aerodrome determined in accordance with Annex IV (Part-CAT)) and flights to isolated aerodromes should be included.

5.2 The method for calculating fuel needed for the various stages of flight.

5.3 When applicable, for aeroplanes, performance data for ETOPS critical fuel reserve and area of operation, including sufficient data to support the critical fuel reserve and area of operation calculation based on approved aircraft performance data. The following data should be included:

- (a) detailed engine(s)-inoperative performance data, including fuel flow for standard and non-standard atmospheric conditions and as a function of airspeed and power setting, where appropriate, covering:
 - (i) drift down (includes net performance), where applicable;
 - (ii) cruise altitude coverage including 10 000 ft;
 - (iii) holding;
 - (iv) altitude capability (includes net performance); and
 - (v) missed approach;
- (b) detailed all-engine-operating performance data, including nominal fuel flow data, for standard and non-standard atmospheric conditions and as a function of airspeed and power setting, where appropriate, covering:
 - (i) cruise (altitude coverage including 10 000 ft); and
 - (ii) holding;

- (c) details of any other conditions relevant to ETOPS operations which can cause significant deterioration of performance, such as ice accumulation on the unprotected surfaces of the aircraft, ram air turbine (RAT) deployment, thrust-reverser deployment, etc.; and
- (d) the altitudes, airspeeds, thrust settings, and fuel flow used in establishing the ETOPS area of operations for each airframe-engine combination should be used in showing the corresponding terrain and obstruction clearances in accordance with Annex IV (Part-CAT).

6 MASS AND BALANCE

Instructions and data for the calculation of the mass and balance, including the following:

- (a) calculation system (e.g. index system);
- (b) information and instructions for completion of mass and balance documentation, including manual and computer generated types;
- (c) limiting masses and centre of gravity for the types, variants or individual aircraft used by the operator;
- (d) dry operating mass and corresponding centre of gravity or index.

7 LOADING

Procedures and provisions for loading and unloading and securing the load in the aircraft.

8 CONFIGURATION DEVIATION LIST

The CDL(s), if provided by the manufacturer, taking account of the aircraft types and variants operated, including procedures to be followed when an aircraft is being dispatched under the terms of its CDL.

9 MINIMUM EQUIPMENT LIST (MEL)

The MEL for each aircraft type or variant operated and the type(s)/area(s) of operation. The MEL should also include the dispatch conditions associated with operations required for a specific approval (e.g. RNAV, RNP, RVSM, ETOPS). Consideration should be given to using the ATA number system when allocating chapters and numbers.

10 SURVIVAL AND EMERGENCY EQUIPMENT INCLUDING OXYGEN

- 10.1 A list of the survival equipment to be carried for the routes to be flown and the procedures for checking the serviceability of this equipment prior to take-off. Instructions regarding the location, accessibility and use of survival and emergency equipment and its associated checklist(s) should also be included.
- 10.2 The procedure for determining the amount of oxygen required and the quantity that is available. The flight profile, number of occupants and possible cabin decompression should be considered.

11 EMERGENCY EVACUATION PROCEDURES

11.1 Instructions for preparation for emergency evacuation, including crew coordination and emergency station assignment.

11.2 Emergency evacuation procedures. A description of the duties of all members of the crew for the rapid evacuation of an aircraft and the handling of the passengers in the event of a forced landing, ditching or other emergency.

12 AIRCRAFT SYSTEMS

A description of the aircraft systems, related controls and indications and operating instructions. Consideration should be given to use the ATA number system when allocating chapters and numbers.

C ROUTE/ROLE/AREA AND AERODROME/OPERATING SITE INSTRUCTIONS AND INFORMATION

1 Instructions and information relating to communications, navigation and aerodromes/operating sites, including minimum flight levels and altitudes for each route to be flown and operating minima for each aerodrome/operating site planned to be used, including the following:

- (a) minimum flight level/altitude;
- (b) operating minima for departure, destination and alternate aerodromes;
- (c) communication facilities and navigation aids;
- (d) runway/final approach and take-off area (FATO) data and aerodrome/operating site facilities;
- (e) approach, missed approach and departure procedures including noise abatement procedures;
- (f) communication-failure procedures;
- (g) search and rescue facilities in the area over which the aircraft is to be flown;
- (h) a description of the aeronautical charts that should be carried on board in relation to the type of flight and the route to be flown, including the method to check their validity;
- (i) availability of aeronautical information and MET services;
- (j) en-route communication/navigation procedures;
- (k) aerodrome/operating site categorisation for flight crew competence qualification;
- (l) special aerodrome/operating site limitations (performance limitations and operating procedures, etc.).

(2) Information related to landing sites available for operations approved in accordance with Subpart L (SET-IMC) of Annex V (Part-SPA) to Regulation (EU) No 965/2012, including:

- (a) a description of the landing site (position, surface, slope, elevation, etc.);
- (b) the preferred landing direction; and

- (c) obstacles in the area.

D TRAINING

- 1 Description of scope: Training syllabi and checking programmes for all operations personnel assigned to operational duties in connection with the preparation and/or conduct of a flight.
 - 2 Content: Training syllabi and checking programmes should include the following:
 - 2.1 for flight crew, all relevant items prescribed in Annex IV (Part-CAT), Annex V (Part-SPA) and ORO.FC;
 - 2.2 for cabin crew, all relevant items prescribed in Annex IV (Part-CAT), Annex V (Part-CC) of Commission Regulation (EU) 1178/2011 and ORO.CC;
 - 2.3 for technical crew, all relevant items prescribed in Annex IV (Part-CAT), Annex V (Part-SPA) and ORO.TC;
 - 2.4 for operations personnel concerned, including crew members:
 - (a) all relevant items prescribed in SPA.DG Subpart G of Annex IV (SPA.DG); and
 - (b) all relevant items prescribed in Annex IV (Part-CAT) and ORO.SEC; and
 - 2.5 for operations personnel other than crew members (e.g. dispatcher, handling personnel, etc.), all other relevant items prescribed in Annex IV (Part-CAT) and in this Annex pertaining to their duties.
 - 3 Procedures:
 - 3.1 Procedures for training and checking.
 - 3.2 Procedures to be applied in the event that personnel do not achieve or maintain the required standards.
 - 3.3 Procedures to ensure that abnormal or emergency situations requiring the application of part or all of the abnormal or emergency procedures, and simulation of instrument meteorological conditions (IMC) by artificial means are not simulated during CAT operations.
 - 4 Description of documentation to be stored and storage periods.
- (b) Notwithstanding (a), an OM that is compiled in accordance with JAR-OPS 3 amendment 5 may be considered to be compliant.
- (c) If there are sections that, because of the nature of the operation, do not apply, it is recommended that operators maintain the numbering system described in [ORO.MLR.101](#) and above and insert 'Not applicable' or 'Intentionally blank' where appropriate.

AMC4 ORO.MLR.100 Operations manual – General

ED Decision 2015/030/R

CONTENTS – NON-COMMERCIAL SPECIALISED OPERATIONS WITH COMPLEX MOTOR-POWERED AIRCRAFT AND COMMERCIAL SPECIALISED OPERATIONS

- (a) The OM should contain at least the following information, where applicable, as relevant to the area and type of operation:

A GENERAL/BASIC

For chapters 0-7 refer to [AMC3 ORO.MLR.100](#).

In addition:

- 6.2 The relevant regulations and guidance to crew members concerning dangerous goods used for specialised tasks (pesticides and chemicals, etc.).

8 OPERATING PROCEDURES**8.1 Flight preparation instructions. As applicable to the operation:**

- 8.1.1 General procedures;
- 8.1.2 Minimum flight altitudes. A description of the method of determination and application of minimum altitudes, including a procedure to establish the minimum altitudes/flight levels;
- 8.1.3 Criteria and responsibilities for determining the adequacy of aerodromes/operating sites to be used;
- 8.1.4 Interpretation of meteorological information. Explanatory material on the decoding of MET forecasts and MET reports relevant to the area of operations, including the interpretation of conditional expressions;
- 8.1.5 Determination of the quantities of fuel, oil and water methanol carried. The methods by which the quantities of fuel, oil and water methanol to be carried are determined and monitored in-flight. The system for maintaining fuel and oil records should also be described;
- 8.1.6 Procedure for the determination of the mass of loads, the calculation of performance margins and the centre of gravity;
- 8.1.7 Emergency procedures, e.g. load, fuel or chemical jettison (to include the actions of all personnel);
- 8.1.8 System for supply of NOTAMS, meteorological and other safety-critical information both at base and in field locations;
- 8.1.9 Mandatory equipment for specific tasks (mirror, cargo sling, load cell, special radio equipment, radar altimeters, etc.);
- 8.1.10 Guidance on the CDL and MEL;
- 8.1.11 Policy on completion and carriage of documents including operator's aircraft technical log and journey log, or equivalent;
- 8.1.12 Any task-specific standard operating procedures not covered above.

8.2 Ground handling instructions. As applicable to the operation:

- 8.2.1 Briefing requirements for in-flight and ground task specialists;
- 8.2.2 Decontamination procedures;
- 8.2.3 Fuelling procedures, including safety precautions during refuelling and defuelling including quality checks required in the field location, precautions against spillage and environmental damage;
- 8.2.4 De-icing and anti-icing on the ground. A description of the de-icing and anti-icing policy and procedures for aircraft on the ground.

-
- 8.3 Flight procedures. As applicable to the operation:
 - 8.3.1 Procedures relevant to the aircraft type, specific task and area;
 - 8.3.2 Altimeter setting procedures;
 - 8.3.3 Actions following alerts from audio warning devices;
 - 8.3.4 GPWS/TAWS for aeroplanes. Procedures and instructions required for the avoidance of controlled flight into terrain, including limitations on high rate of descent near the surface (the related training requirements are covered in OM-D 2.1);
 - 8.3.5 Policy and procedures for the use of TCAS/ACAS for aeroplanes and, when applicable, for helicopters;
 - 8.3.6 Policy and procedures for in-flight fuel management;
 - 8.3.7 Procedures for operating in adverse and potentially hazardous atmospheric conditions;
 - 8.3.8 Wake turbulence and rotor downwash for helicopters;
 - 8.3.9 Use of restraint devices;
 - 8.3.10 Policy on use of vacant seats;
 - 8.3.11 Cabin safety requirements including smoking.
 - 8.4 Task-specific weather limitations.
 - 8.5 Use of the minimum equipment and configuration deviation list(s).
 - 8.6 Oxygen requirements. An explanation of the conditions under which oxygen should be provided and used (altitude, exposure times, night etc.).
- 9 DANGEROUS GOODS AND WEAPONS
- 9.1 Information, instruction and general guidance on the transport of dangerous goods as internal or external loads, including:
 - 9.1.1 The operator's policy on the transport of dangerous goods;
 - 9.1.2 Guidance on the requirements for acceptance, labelling, handling, stowage, and segregation of dangerous goods;
 - 9.1.3 Procedures for responding to emergency situations involving dangerous goods;
 - 9.1.4 Duties of all personnel involved; and
 - 9.1.5 Instructions on carriage of the operator's personnel on cargo aircraft when dangerous goods are being carried.
 - 9.2 The conditions under which weapons, munitions of war and sporting weapons may be carried.
- 10 SECURITY
- Security instructions, guidance, procedures, training and responsibilities, taking into account Regulation (EC) No 300/2008. Some parts of the security instructions and guidance may be kept confidential.

11 HANDLING, NOTIFYING AND REPORTING ACCIDENTS, INCIDENTS AND OCCURRENCES, AND USING THE CVR RECORDINGS

Procedures for handling, notifying and reporting accidents, incidents and occurrences. This section should include:

- 11.1 Definitions of accidents and occurrences and responsibilities of all persons involved;
- 11.2 Reporting procedures (including any mandatory forms);
- 11.3 Special notification when dangerous goods are carried; and
- 11.4 Procedures for the preservation of recordings of the flight recorders in order to prevent inadvertent reactivation, repair or reinstallation of the flight recorders following an accident or a serious incident or when this preservation is directed by the investigating authority.

12 RULES OF THE AIR

In addition to the items referred to in [AMC3 ORO.MLR.100](#), territorial procedures for obtaining permissions and exemptions, e.g. for underslung loads and lowflying clearances.

13 LEASING

Refer to [AMC3 ORO.MLR.100](#).

B AIRCRAFT OPERATING MATTERS — TYPE RELATED

For chapters 0-1 refer to [AMC3 ORO.MLR.100](#).

2 NORMAL PROCEDURES

The normal procedures and duties assigned to the crew, the appropriate checklists and the system for their use, including any task or specific role equipment procedures not contained in the AFM.

3 ABNORMAL AND/OR EMERGENCY PROCEDURES

The abnormal and/or emergency procedures and duties assigned to the crew, the appropriate checklists and the system for their use, including any task or specific role equipment emergency procedures not contained in the AFM.

4 PERFORMANCE

- 4.1 Performance data should be provided in a form in which it can be used without difficulty.
- 4.2 Performance data. Performance material which provides the necessary data for compliance with the performance requirements prescribed in Part-SPO.

5 FLIGHT PLANNING

- 5.1 Data and instructions necessary for pre-flight and in-flight planning.
- 5.2 Procedures for specialised tasks.

6 MASS AND BALANCE

Instructions and data for the calculation of the mass and balance, including:

- 6.1 Calculation system (e.g. index system);

-
- 6.2 Information and instructions for completion of mass and balance documentation; and
 - 6.3 Limitations.
 - 7 LOADING

Refer to [AMC3 ORO.MLR.100](#).
 - 8 CONFIGURATION DEVIATION LIST (CDL)

Refer to [AMC3 ORO.MLR.100](#).
 - 9 MINIMUM EQUIPMENT LIST (MEL)

The MEL for each aircraft type or variant operated and the type(s)/area(s) of operation. It should also contain procedures to be followed when an aircraft is being dispatched with one or more inoperative items, in accordance with the MEL.
 - 10 SURVIVAL AND EMERGENCY EQUIPMENT INCLUDING OXYGEN
 - 10.1 A list of the survival equipment to be carried, taking into account the nature of the area of operation, such as a hostile or a non-hostile environment.
 - 10.2 A checklist for assessing the serviceability of the equipment and instructions for its use prior to take-off.
 - 10.3 The procedure for determining the amount of oxygen required and the quantity that is available.
 - 11 EMERGENCY EVACUATION PROCEDURES
 - 11.1 Emergency evacuation procedures, crew coordination and occupant handling in the event of a forced landing, ditching or other emergency.
 - 12 AIRCRAFT SYSTEMS

A description of the aircraft systems and all equipment specific to the tasks. Additional equipment, systems or fitting, related special procedures including any supplements to the AFM.
 - C TASKS AND OPERATING AREAS INSTRUCTIONS AND INFORMATION

Specific instructions related to the specialised tasks and operating areas in accordance with [AMC3 ORO.MLR.100](#).
 - D TRAINING
 - 1 Training syllabi and checking programmes for all operations personnel assigned to operational duties in connection with the preparation and/or conduct of a flight.
 - 2 Training syllabi and checking programmes should include:
 - 2.1 For flight crew, all relevant items prescribed in Part-SPO, Part-SPA and this Part;
 - 2.2 For other crew members, all relevant items prescribed in Part-SPO and this Part, as applicable;
 - 2.3 For in-flight and ground task specialists concerned, including crew members:
 - a. All relevant items prescribed in SPA.DG; and
 - b. All relevant items prescribed in Part-SPO and ORO.SEC; and

- 2.4 For operations personnel other than crew members, all other relevant items pertaining to their duties prescribed in Part-SPO and this Part.
 - 3 Procedures:
 - 3.1 Procedures for training and checking.
 - 3.2 Procedures to be applied in the event that personnel do not achieve or maintain the required standards.
 - 3.3 A system for tracking expiry dates for qualifications, checks, tests, recency and licences.
 - 4 Description of documentation to be stored and storage periods.
- (b) If there are sections that, because of the nature of the operation, do not apply, it is recommended that operators maintain the numbering system described in [ORO.MLR.101](#) and above and insert 'Not applicable' or 'Intentionally blank' where appropriate.

AMC5 ORO.MLR.100 Operations manual — general

ED Decision 2021/005/R

CROSSWIND LIMITATIONS IN THE OPERATIONS MANUAL (OM)

When publishing operational crosswind limitations in Part B of the OM in accordance with [AMC3 ORO.MLR.100](#), operators should consider:

- (a) the following manufacturer's information:
 - (1) values published in the 'Limitations' Section of the AFM;
 - (2) maximum demonstrated crosswind values, when more limiting values are not published in the 'Limitations' Section of the AFM;
 - (3) gust values; and
 - (4) additional guidance or recommendations;
- (b) operational experience; and
- (c) operating-environment factors such as:
 - (1) runway width;
 - (2) runway surface condition; and
 - (3) prevailing weather conditions.

GM1 ORO.MLR.100(k) Operations manual – general

ED Decision 2014/017/R

HUMAN FACTORS PRINCIPLES

Guidance material on the application of human factors principles can be found in the ICAO Human Factors Training Manual (Doc 9683).

ORO.MLR.101 Operations manual – structure for commercial air transport

Regulation (EU) 2018/1975

Except for operations with single-engined propeller-driven aeroplanes with an MOPSC of 5 or less or single-engined non-complex helicopters with an MOPSC of 5 or less, taking off and landing at the same aerodrome or operating site, under VFR by day, the main structure of the OM shall be as follows:

- (a) Part A: General/Basic, comprising all non-type-related operational policies, instructions and procedures;
- (b) Part B: Aircraft operating matters, comprising all type-related instructions and procedures, taking into account differences between types/classes, variants or individual aircraft used by the operator;
- (c) Part C: Commercial air transport operations, comprising route/role/area and aerodrome/operating site instructions and information;
- (d) Part D: Training, comprising all training instructions for personnel required for a safe operation.

ORO.MLR.105 Minimum equipment list

Regulation (EU) 2015/140

- (a) A minimum equipment list (MEL) shall be established as specified under point 8.a.3 of Annex IV to Regulation (EC) No 216/2008, based on the relevant master minimum equipment list (MMEL) as defined in the data established in accordance with Regulation (EU) No 748/2012. If an MMEL has not been established as part of the operational suitability data, the MEL may be based on the relevant MMEL accepted by the State of Operator or Registry as applicable.
- (b) The MEL and any amendment thereto shall be approved by the competent authority.
- (c) The operator shall amend the MEL after any applicable change to the MMEL within the acceptable timescales.
- (d) In addition to the list of items, the MEL shall contain:
 - (1) a preamble, including guidance and definitions for flight crews and maintenance personnel using the MEL;
 - (2) the revision status of the MMEL upon which the MEL is based and the revision status of the MEL;
 - (3) the scope, extent and purpose of the MEL.
- (e) The operator shall:
 - (1) establish rectification intervals for each inoperative instrument, item of equipment or function listed in the MEL. The rectification interval in the MEL shall not be less restrictive than the corresponding rectification interval in the MMEL;
 - (2) establish an effective rectification programme;
 - (3) only operate the aircraft after expiry of the rectification interval specified in the MEL when:
 - (i) the defect has been rectified; or
 - (ii) the rectification interval has been extended in accordance with (f).

-
- (f) Subject to approval of the competent authority, the operator may use a procedure for the one time extension of category B, C and D rectification intervals, provided that:
- (1) the extension of the rectification interval is within the scope of the MMEL for the aircraft type;
 - (2) the extension of the rectification interval is, as a maximum, of the same duration as the rectification interval specified in the MEL;
 - (3) the rectification interval extension is not used as a normal means of conducting MEL item rectification and is used only when events beyond the control of the operator have precluded rectification;
 - (4) a description of specific duties and responsibilities for controlling extensions is established by the operator;
 - (5) the competent authority is notified of any extension of the applicable rectification interval; and
 - (6) a plan to accomplish the rectification at the earliest opportunity is established.
- (g) The operator shall establish the operational and maintenance procedures referenced in the MEL taking into account the operational and maintenance procedures referenced in the MMEL. These procedures shall be part of the operator's manuals or the MEL.
- (h) The operator shall amend the operational and maintenance procedures referenced in the MEL after any applicable change to the operational and maintenance procedures referenced in the MMEL.
- (i) Unless otherwise specified in the MEL, the operator shall complete:
- (1) the operational procedures referenced in the MEL when planning for and/or operating with the listed item inoperative; and
 - (2) the maintenance procedures referenced in the MEL prior to operating with the listed item inoperative.
- (j) Subject to a specific case-by-case approval by the competent authority, the operator may operate an aircraft with inoperative instruments, items of equipment or functions outside the constraints of the MEL but within the constraints of the MMEL, provided that:
- (1) the concerned instruments, items of equipment or functions are within the scope of the MMEL as defined in point (a);
 - (2) the approval is not used as a normal means of conducting operations outside the constraints of the approved MEL and is used only when events beyond the control of the operator have precluded the MEL compliance;
 - (3) a description of specific duties and responsibilities for controlling the operation of the aircraft under such approval is established by the operator; and
 - (4) a plan to rectify the inoperative instruments, items of equipment or functions or to return operating the aircraft under the MEL constraints at the earliest opportunity is established.

GM1 ORO.MLR.105(a) Minimum equipment list

ED Decision 2014/017/R

GENERAL

- (a) The Minimum Equipment List (MEL) is a document that lists the equipment that may be temporarily inoperative, subject to certain conditions, at the commencement of flight. This document is prepared by the operator for their own particular aircraft taking account of their aircraft configuration and all those individual variables that cannot be addressed at MMEL level, such as operating environment, route structure, geographic location, aerodromes where spare parts and maintenance capabilities are available, etc., in accordance with a procedure approved by the competent authority.
- (b) The MMEL, as defined in the mandatory part of the operational suitability data established in accordance with Commission Regulation (EU) No 748/2012, is developed in compliance with CS-MMEL or CS-GEN-MMEL. These Certification Specifications contain, among other, guidance intended to standardise the level of relief granted in MMELs, in particular for items that are subject to operational requirements. If a MMEL established as part of the operational suitability data is not available and items subject to operational requirements are listed in the available MMEL without specific relief or dispatch conditions but only with a reference to the operational requirements, the operator may refer to CS-MMEL or CS-GEN-MMEL guidance material, as applicable, to develop the relevant MEL content for such items.

NON-SAFETY-RELATED EQUIPMENT

- (a) Most aircraft are designed and certified with a significant amount of equipment redundancy, such that the airworthiness requirements are satisfied by a substantial margin. In addition, aircraft are generally fitted with equipment that is not required for safe operation under all operating conditions, e.g. instrument lighting in day VMC.
- (b) All items related to the airworthiness, or required for the safe operation, of the aircraft and not included in the list are automatically required to be operative.
- (c) Equipment, such as entertainment systems or galley equipment, may be installed for passenger convenience. If this non-safety-related equipment does not affect the airworthiness or operation of the aircraft when inoperative, it does not require a rectification interval, and need not be listed in the operator's MEL, if it is not addressed in the MMEL. The exceptions to this are as follows:
 - (1) Where non-safety-related equipment serves a second function, such as movie equipment being used for cabin safety briefings, operators should develop and include operational contingency procedures in the MEL in case of an equipment malfunction.
 - (2) Where non-safety-related equipment is part of another aircraft system, for example the electrical system, procedures should be developed and included in the MEL for deactivating and securing in case of malfunction. In these cases, the item should be listed in the MEL, with compensating provisions and deactivation instructions if applicable. The rectification interval will be dependent on the secondary function of the item and the extent of its effect on other systems.
- (d) If the operator chooses to list non-safety-related equipment in the MEL, not listed in the MMEL, they should include a rectification interval category. These items may be given a 'D' category rectification interval provided any applicable (M) procedure (in the case of electrically supplied items) is applied.

- (e) Operators should establish an effective decision making process for failures that are not listed to determine if they are related to airworthiness and required for safe operation. In order for inoperative installed equipment to be considered non-safety-related, the following criteria should be considered:
- (1) the operation of the aircraft is not adversely affected such that standard operating procedures related to ground personnel, and crew members are impeded;
 - (2) the condition of the aircraft is not adversely affected such that the safety of passengers and/or personnel is jeopardised;
 - (3) the condition of the aircraft is configured to minimise the probability of a subsequent failure that may cause injury to passengers/personnel and/or cause damage to the aircraft;
 - (4) the condition does not include the use of required emergency equipment and does not impact emergency procedures such that personnel could not perform them.

AMC1 ORO.MLR.105(c) Minimum equipment list

ED Decision 2014/017/R

AMENDMENTS TO THE MEL FOLLOWING CHANGES TO THE MMEL — APPLICABLE CHANGES AND ACCEPTABLE TIMESCALES

- (a) The following are applicable changes to the MMEL that require amendment of the MEL:
- (1) a reduction of the rectification interval;
 - (2) change of an item, only when the change is applicable to the aircraft or type of operations and is more restrictive.
- (b) An acceptable timescale for submitting the amended MEL to the competent authority is 90 days from the effective date specified in the approved change to the MMEL.
- (c) Reduced timescales for the implementation of safety-related amendments may be required if the Agency and/or the competent authority consider it necessary.

AMC1 ORO.MLR.105(d) Minimum equipment list

ED Decision 2014/017/R

MEL FORMAT

- (a) The MEL format and the presentation of items and dispatch conditions should reflect those of the MMEL.
- (b) The ATA 100/2200 Specification numbering system for MEL items is preferred.
- (c) Other formats and item numbering systems may be used provided they are clear and unambiguous.

AMC1 ORO.MLR.105(d)(1) Minimum equipment list

ED Decision 2014/017/R

MEL PREAMBLE

The MEL preamble should:

- (a) reflect the content of the MMEL preamble as applicable to the MEL scope and extent;

- (b) contain terms and definitions used in the MEL;
- (c) contain any other relevant specific information for the MEL scope and use that is not originally provided in the MMEL;
- (d) provide guidance on how to identify the origin of a failure or malfunction to the extent necessary for appropriate application of the MEL;
- (e) contain guidance on the management of multiple unserviceabilities, based on the guidance given in the MMEL; and
- (f) contain guidance on placarding of inoperative items to inform crew members of equipment condition, as appropriate. In particular, when such items are accessible to the crew during flight, the control(s) and indicator(s) related to inoperative unit(s) should be clearly placarded.

AMC1 ORO.MLR.105(d)(3) Minimum equipment list

ED Decision 2019/019/R

SCOPE OF THE MEL

The MEL should include:

- (a) The dispatch conditions associated with flights conducted in accordance with specific approvals held by the operator in accordance with Part-SPA.
- (b) Specific provision for particular types of operations carried out by the operator in accordance with [ORO.GEN.310](#) and with [ORO.AOC.125](#).

AMC2 ORO.MLR.105(d)(3) Minimum equipment list

ED Decision 2014/017/R

EXTENT OF THE MEL

The operator should include guidance in the MEL on how to deal with any failures that occur between the commencement of the flight and the start of the take-off. If a failure occurs between the commencement of the flight and the start of the take-off, any decision to continue the flight should be subject to pilot judgement and good airmanship. The pilot-in-command/commander may refer to the MEL before any decision to continue the flight is taken.

GM1 ORO.MLR.105(d)(3) Minimum equipment list

ED Decision 2019/019/R

SCOPE OF THE MEL

- (a) Examples of special approvals in accordance with Part-SPA may be:
 - (1) RVSM,
 - (2) ETOPS,
 - (3) LVO.
- (b) Different types of operations carried out by the operator in accordance with [ORO.GEN.310](#) and with [ORO.AOC.125](#):
 - (1) crew training,
 - (2) positioning flights,

- (3) demonstration flights.
- (c) When an aircraft has installed equipment which is not required for the operations conducted, the operator may wish to delay rectification of such items for an indefinite period. Such cases are considered to be out of the scope of the MEL, therefore modification of the aircraft is appropriate and deactivation, inhibition or removal of the item should be accomplished by an appropriate approved modification procedure.

GM2 ORO.MLR.105(d)(3) Minimum equipment list

ED Decision 2014/017/R

PURPOSE OF THE MEL

The MEL is an alleviating document having the purpose to identify the minimum equipment and conditions to operate safely an aircraft having inoperative equipment. Its purpose is not, however, to encourage the operation of aircraft with inoperative equipment. It is undesirable for aircraft to be dispatched with inoperative equipment and such operations are permitted only as a result of careful analysis of each item to ensure that the acceptable level of safety, as intended in the applicable airworthiness and operational requirements is maintained. The continued operation of an aircraft in this condition should be minimised.

GM1 ORO.MLR.105(e);(f) Minimum equipment list

ED Decision 2014/017/R

RECTIFICATION INTERVAL (RI)

The definitions and categories of rectification intervals are provided in CS-MMEL.

AMC1 ORO.MLR.105(f) Minimum equipment list

ED Decision 2014/017/R

RECTIFICATION INTERVAL EXTENSION (RIE) — OPERATOR PROCEDURES FOR THE APPROVAL BY THE COMPETENT AUTHORITY AND NOTIFICATION TO THE COMPETENT AUTHORITY

- (a) The operator's procedures to address the extension of rectification intervals and ongoing surveillance to ensure compliance should provide the competent authority with details of the name and position of the nominated personnel responsible for the control of the operator's rectification interval extension (RIE) procedures and details of the specific duties and responsibilities established to control the use of RIEs.
- (b) Personnel authorising RIEs should be adequately trained in technical and/or operational disciplines to accomplish their duties. They should have necessary operational knowledge in terms of operational use of the MEL as alleviating documents by flight crew and maintenance personnel and engineering competence. The authorising personnel should be listed by appointment and name.
- (c) The operator should notify the competent authority within 1 month of the extension of the applicable rectification interval or within the appropriated timescales specified by the approved procedure for the RIE.
- (d) The notification should be made in a form determined by the competent authority and should specify the original defect, all such uses, the reason for the RIE and the reasons why rectification was not carried out within the original rectification interval.

GM1 ORO.MLR.105(f) Minimum equipment list

ED Decision 2014/017/R

RECTIFICATION INTERVAL EXTENSION (RIE)

Procedures for the extension of rectification intervals should only be applied under certain conditions, such as a shortage of parts from manufacturers or other unforeseen situations (e.g. inability to obtain equipment necessary for proper troubleshooting and repair), in which case the operator may be unable to comply with the specified rectification intervals.

AMC1 ORO.MLR.105(g) Minimum equipment list

ED Decision 2017/007/R

OPERATIONAL AND MAINTENANCE PROCEDURES

- (a) The operational and maintenance procedures referenced in the MEL should be based on the operational and maintenance procedures referenced in the MMEL. Modified procedures may, however, be developed by the operator when they provide the same level of safety, as required by the MMEL. Modified maintenance procedures should be developed in accordance with Commission Regulation (EU) No 1321/2014.
- (b) Providing appropriate operational and maintenance procedures referenced in the MEL, regardless of who developed them, is the responsibility of the operator.
- (c) Any item in the MEL requiring an operational or maintenance procedure to ensure an acceptable level of safety should be so identified in the 'remarks' or 'exceptions' column/part/section of the MEL. This will normally be '(O)' for an operational procedure, or '(M)' for a maintenance procedure. '(O)(M)' means both operational and maintenance procedures are required.
- (d) The satisfactory accomplishment of all procedures, regardless of who performs them, is the responsibility of the operator.

GM1 ORO.MLR.105(g) Minimum equipment list

ED Decision 2017/007/R

OPERATIONAL AND MAINTENANCE PROCEDURES

- (a) Operational and maintenance procedures are an integral part of the compensating conditions needed to maintain an acceptable level of safety, enabling the competent authority to approve the MEL. The competent authority may request presentation of fully developed (O) and/or (M) procedures in the course of the MEL approval process.
- (b) Normally, operational procedures are accomplished by the flight crew; however, other personnel may be qualified and authorised to perform certain functions.
- (c) Normally, maintenance procedures are accomplished by the maintenance personnel; however, other personnel may be qualified and authorised to perform certain functions in accordance with Commission Regulation (EU) No 1321/2014.
- (d) Operator's manuals may include the OM, the continued airworthiness management organisation manual (CAME) or other documents. Operational and maintenance procedures, regardless of the document where they are contained, should be readily available for use when needed for the application of the MEL.

- (e) Unless specifically permitted by a maintenance procedure, an inoperative item may not be removed from the aircraft.

AMC1 ORO.MLR.105(h) Minimum equipment list

ED Decision 2015/005/R

OPERATIONAL AND MAINTENANCE PROCEDURES — APPLICABLE CHANGES

- (a) Changes to the operational and maintenance procedures referenced in the MMEL are considered applicable and require the amendment of the maintenance and operating procedures referenced in the MEL when:
- (1) the modified procedure is applicable to the operator's MEL; and
 - (2) the purpose of this change is to improve compliance with the intent of the associated MMEL dispatch condition.
- (b) An acceptable timescale for the amendments of maintenance and operating procedures, as defined in (a), should be 90 days from the date when the amended procedures referenced in the MMEL are made available. Reduced timescales for the implementation of safety related amendments may be required if the competent authority considers it necessary.

AMC1 ORO.MLR.105(j) Minimum equipment list

ED Decision 2014/017/R

OPERATION OF AN AIRCRAFT WITHIN THE CONSTRAINTS OF THE MMEL — OPERATOR'S PROCEDURES FOR THE APPROVAL BY THE COMPETENT AUTHORITY

- (a) The operator's procedures to address the operation of an aircraft outside the constraints of the MEL but within the constraints of the MMEL and ongoing surveillance to ensure compliance should provide the competent authority with details of the name and position of the nominated personnel responsible for the control of the operations under such conditions and details of the specific duties and responsibilities established to control the use of the approval.
- (b) Personnel authorising operations under such approval should be adequately trained in technical and operational disciplines to accomplish their duties. They should have the necessary operational knowledge in terms of operational use of the MEL as alleviating documents by flight crew and maintenance personnel and engineering competence. The authorising personnel should be listed by appointment and name.

GM1 ORO.MLR.105(j) Minimum equipment list

ED Decision 2014/017/R

OPERATION OF AN AIRCRAFT WITHIN THE CONSTRAINTS OF THE MMEL — OPERATOR'S PROCEDURES FOR THE APPROVAL BY THE COMPETENT AUTHORITY

Procedures for the operation of an aircraft outside the constraints of the MEL but within the constraints of the MMEL should only be applied under certain conditions, such as a shortage of parts from manufacturers or other unforeseen situations (e.g. inability to obtain equipment necessary for proper troubleshooting and repair), in which case the operator may be unable to comply with the constraints specified in the MEL.

ORO.MLR.110 Journey log

Regulation (EU) No 379/2014

Particulars of the aircraft, its crew and each journey shall be retained for each flight, or series of flights, in the form of a journey log, or equivalent.

AMC1 ORO.MLR.110 Journey log

ED Decision 2014/017/R

GENERAL

- (a) The aircraft journey log, or equivalent, should include the following items, where applicable:
- (1) aircraft nationality and registration,
 - (2) date,
 - (3) name(s) of crew member(s),
 - (4) duty assignments of crew member(s),
 - (5) place of departure,
 - (6) place of arrival,
 - (7) time of departure,
 - (8) time of arrival,
 - (9) hours of flight,
 - (10) nature of flight (scheduled or non-scheduled),
 - (11) incidents, observations, if any,
 - (12) signature of person in charge.
- (b) The information, or parts thereof, may be recorded in a form other than on printed paper. Accessibility, usability and reliability should be assured.
- (c) 'Journey log, or equivalent' means that the required information may be recorded in documentation other than a log book, such as the operational flight plan or the aircraft technical log.
- (d) 'Series of flights' means consecutive flights, which begin and end:
- (1) within a 24-hour period;
 - (2) at the same aerodrome or operating site or remain within a local area specified in the operations manual; and
 - (3) with the same pilot-in-command/commander of the aircraft.

GM1 ORO.MLR.110 Journey log

ED Decision 2014/017/R

SERIES OF FLIGHTS

The term 'series of flights' is used to facilitate a single set of documentation.

ORO.MLR.115 Record-keeping

Regulation (EU) No 379/2014

- (a) The following records shall be stored for at least 5 years.
- (1) for CAT operators, records of the activities referred to in [ORO.GEN.200](#);
 - (2) for declared operators, a copy of the operator's declaration, details of approvals held and operations manual;
 - (3) for SPO authorisation holders, in addition to (a)(2), records related to the risk assessment conducted in accordance with [SPO.OP.230](#) and related standard operating procedures.
- (b) The following information used for the preparation and execution of a flight, and associated reports, shall be stored for three months:
- (1) the operational flight plan, if applicable;
 - (2) route-specific notice(s) to airmen (NOTAM) and aeronautical information services (AIS) briefing documentation, if edited by the operator;
 - (3) mass and balance documentation;
 - (4) notification of special loads, including written information to the commander/pilot-in-command about dangerous goods, if applicable;
 - (5) the journey log, or equivalent; and
 - (6) flight report(s) for recording details of any occurrence, or any event that the commander/pilot-in-command deems necessary to report or record;

- (c) Personnel records shall be stored for the periods indicated below:

Flight crew licence and cabin crew attestation	As long as the crew member is exercising the privileges of the licence or attestation for the aircraft operator
Crew member training, checking and qualifications	3 years
Records on crew member recent experience	15 months
Crew member route and aerodrome/task and area competence, as appropriate	3 years
Dangerous goods training, as appropriate	3 years
Training/qualification records of other personnel for whom a training programme is required	Last 2 training records

- (d) The operator shall:
- (1) maintain records of all training, checking and qualifications of each crew member, as prescribed in Part-ORO; and
 - (2) make such records available, on request, to the crew member concerned.
- (e) The operator shall preserve the information used for the preparation and execution of a flight and personnel training records, even if the operator ceases to be the operator of that aircraft or the employer of that crew member, provided this is within the timescales prescribed in (c).
- (f) If a crew member becomes a crew member for another operator, the operator shall make the crew member's records available to the new operator, provided this is within the timescales prescribed in (c).

AMC1 ORO.MLR.115 Record-keeping

ED Decision 2014/017/R

TRAINING RECORDS

A summary of training should be maintained by the operator to show every crew member's completion of each stage of training and checking.

GM1 ORO.MLR.115(c) Record-keeping

ED Decision 2017/007/R

PERSONNEL RECORDS

'Personnel records' in [ORO.MLR.115\(c\)](#) means detailed crew member training, checking and qualification records. These records include detailed examination records.

GM1 ORO.MLR.115(d) Record-keeping

ED Decision 2017/007/R

TRAINING, CHECKING AND QUALIFICATION RECORDS

Training, checking and qualification records include records of all training, checking and qualifications of each crew member, as prescribed in Part-ORO.

SUBPART SEC: SECURITY

ORO.SEC.100 Flight crew compartment security – aeroplanes

Regulation (EU) 2019/1387

- (a) In an aeroplane which is equipped with a secure flight crew compartment door, that door shall be capable of being locked, and means shall be provided by which the cabin crew can notify the flight crew in the event of suspicious activity or security breaches in the cabin.
- (b) All passenger-carrying aeroplanes that are engaged in the commercial transportation of passengers shall be equipped with an approved secure flight crew compartment door that is capable of being locked and unlocked from either pilot's station and designed to meet the applicable airworthiness requirements, where such airplanes fall within any of the following categories:
 - (1) aeroplanes with an MCTOM that exceeds 54 500 kg;
 - (2) aeroplanes with an MCTOM that exceeds 45 500 kg and have an MOPSC of more than 19; or
 - (3) aeroplanes with an MOPSC of more than 60.
- (c) In all aeroplanes which are equipped with a secure flight crew compartment door in accordance with point (b):
 - (1) that door shall be closed prior to engine start for take-off and shall be locked when required so by security procedures or by the pilot-in-command until engine shutdown after landing, except when deemed to be necessary for authorised persons to access or egress in compliance with national civil aviation security programmes;
 - (2) means shall be provided for monitoring from either pilot's station the entire door area outside the flight crew compartment to identify persons that request to enter and to detect suspicious behaviour or potential threat.

ORO.SEC.105 Flight crew compartment security – helicopters

Regulation (EU) No 379/2014

If installed, the flight crew compartment door on a helicopter operated for the purpose of carrying passengers shall be capable of being locked from within the flight crew compartment in order to prevent unauthorised access.

SUBPART FC: FLIGHT CREW

ORO.FC.005 Scope

Regulation (EU) 2018/1975

This Subpart establishes requirements to be met by the operator related to flight crew training, experience and qualification and comprises:

- (a) SECTION 1 specifying common requirements applicable to both non-commercial operations of complex motor-powered aircraft and any commercial operation;
- (b) SECTION 2 specifying additional requirements applicable to commercial air transport operations, with the exception of commercial air transport operations of passengers conducted under VFR by day, starting and ending at the same aerodrome or operating site and within a local area specified by the competent authority, with:
 - (1) single-engined propeller-driven aeroplanes having an MCTOM of 5 700 kg or less and an MOPSC of 5 or less; or
 - (2) other-than-complex motor-powered helicopters, single-engined, with an MOPSC of 5 or less.
- (c) SECTION 3 specifying additional requirements for commercial specialised operations and for those referred to in b(1) and (2).

SECTION 1 – COMMON REQUIREMENTS

ORO.FC.100 Composition of flight crew

Regulation (EU) 2021/2237

- (a) The composition of the flight crew and the number of flight crew members at designated crew stations shall be not less than the minimum specified in the aircraft flight manual or operating limitations prescribed for the aircraft.
- (b) The flight crew shall include additional flight crew members when required by the type of operation and shall not be reduced below the number specified in the operations manual.
- (c) All flight crew members shall hold a licence and ratings issued or accepted in accordance with [Commission Regulation \(EU\) No 1178/2011](#)¹ and appropriate to the duties assigned to them.
- (d) The flight crew member may be relieved in flight of his or her duties at the controls by another suitably qualified flight crew member.
- (e) When engaging the services of flight crew members who are working on a freelance or part-time basis, the operator shall verify that all applicable requirements of this Subpart and the relevant elements of Annex I (Part-FCL) to [Regulation \(EU\) No 1178/2011](#), including the requirements on recent experience, are complied with, taking into account all services rendered by the flight crew member to other operator(s) to determine in particular:
 - (1) the total number of aircraft types or variants operated; and
 - (2) the applicable flight and duty time limitations and rest requirements.

¹ OJ L 311, 25.11.2011, p. 1.

(f) Specific requirements for helicopter operations

If the helicopter is operated with a crew of two pilots, each pilot shall either:

- (1) hold a certificate of satisfactory completion of a multi-crew cooperation (MCC) course in helicopters in accordance with [Regulation \(EU\) No 1178/2011](#); or
- (2) have at least 500 hours of flight time as a pilot in multi-pilot operations.

GM1 ORO.FC.100(c) Composition of flight crew

ED Decision 2022/014/R

LICENCE AND RATINGS IN ACCORDANCE WITH COMMISSION REGULATION (EU) No 1178/2011

When determining the composition of the crew, and monitoring whether the flight crew holds the appropriate licence and ratings, the operator needs to take into account any limitations prescribed in [Regulation \(EU\) No 1178/2011](#) applicable to the flight crew members such as, but not limited to, recent experience and operational multi-pilot limitation.

ORO.FC.105 Designation as pilot-in-command/commander

Regulation (EU) 2021/2237

- (a) In accordance with point 8.6 of Annex V to [Regulation \(EU\) 2018/1139](#), one pilot amongst the flight crew, qualified as pilot-in-command in accordance with Annex I (Part-FCL) to [Regulation \(EU\) No 1178/2011](#), shall be designated by the operator as pilot-in-command or, for commercial air transport operations, as commander.
- (b) The operator shall only designate a flight crew member to act as pilot-in-command/commander if all of the following apply:
 - (1) the flight crew member has the minimum level of experience specified in the operations manual;
 - (2) the flight crew member has adequate knowledge of the route or area to be flown and of the aerodromes, including alternate aerodromes, facilities and procedures to be used;
 - (3) in the case of multi-crew operations, the flight crew member has completed an operator's command course if upgrading from co-pilot to pilot-in-command/commander.
- (c) In the case of commercial operations of aeroplanes and helicopters, the pilot-in-command/commander or the pilot to whom the conduct of the flight may be delegated shall have had initial familiarisation training on the route or area to be flown and on the aerodromes, facilities and procedures to be used and shall maintain this knowledge as follows:
 - (1) The validity of the aerodrome knowledge shall be maintained by operating at least once on the aerodrome within a 12 calendar months' period.
 - (2) The route or area knowledge shall be maintained by operating at least once to the route or area within a 36 months' period. In addition, refresher training is required regarding route or area knowledge if not operating on a route or area for 12 months within the 36-month period.
- (d) Notwithstanding point (c), in the case of operations under VFR by day with performance class B and C aeroplanes and helicopters, familiarisation training on the route and aerodromes may be replaced by area familiarisation training.

**AMC1 ORO.FC.105(b)(2);(c)
pilot-in-command/commander****Designation****as**

ED Decision 2022/014/R

GENERAL

The operator should comply with the national training and checking requirements published in the aeronautical information publication (AIP).

ROUTE, AREA AND AERODROME KNOWLEDGE FOR COMMERCIAL OPERATIONS

The experience of the route or area to be flown and of the aerodrome facilities and procedures to be used should include the following:

(a) Area and route knowledge

- (1) An objective of the area and route training should be to ensure that the pilot has knowledge of:
 - (i) terrain and minimum safe altitudes;
 - (ii) seasonal meteorological conditions;
 - (iii) meteorological, communication and air traffic facilities, services and procedures;
 - (iv) search and rescue procedures where available; and
 - (v) navigational facilities associated with the area or route along which the flight is to take place.
- (2) Another objective of the area and route training should be to ensure that the pilots are aware of the most significant underlying risks and threats of a route or an area that could affect their operations following the 'threat and error management model' or an alternative risk model agreed with the authority.
- (3) The area and route familiarisation training should:
 - (i) be based on an assessment by the operator of the underlying risks and threats of a route or an area using:
 - (A) internal evidence;
 - (B) external evidence;
 - (ii) be conducted:
 - (A) as an initial training before operating to a route and area;
 - (B) as a refresher training after not operating to a route and area for 12 months.
- (4) The area and route familiarisation training should be delivered using different methods and tools.
 - (i) The selection of the method and tools should result from a combination of the learning objectives and the type of risk or threat that needs to be trained.
 - (ii) The selection of the appropriate method and tool should be driven by the desired outcome in terms of adequate knowledge and awareness.
 - (iii) The methods and tools employed should include one or more of the following: Training in a flight simulation training device (FSTD), computer-based training, familiarisation flight as a pilot in-command/commander or co-pilot under

supervision or an observer, video training, virtual reality training, familiarisation by self-briefing with route documentation and audio training.

(b) Aerodrome knowledge

- (1) Aerodrome familiarisation training should include knowledge of obstructions, physical layout, lighting, approach aids and arrival, departure, holding and instrument approach procedures, applicable operating minima and ground movement considerations.
- (2) The operations manual should describe the method of categorisation of aerodromes and, in the case of CAT operations, provide a list of those aerodromes categorised as B or C.
- (3) All aerodromes to which an operator operates should be categorised in one of these three categories:
 - (i) category A — an aerodrome that meets all the following conditions:
 - (A) a straight-in 3D instrument approach procedure with a glide path angle of not more than 3.5 degrees to each runway expected to be used for landing;
 - (B) at least one runway with no performance-limited procedure for take-off and/or landing, such as no requirement to follow a contingency procedure for obstacle clearance in the event of an engine failure on take-off from any runway expected to be used for departure; and
 - (C) night operations capability.
 - (ii) category B — an aerodrome that does not meet the category A conditions or which requires extra considerations due to:
 - (A) non-standard approach aids and/or approach patterns, such as restrictions on the availability of straight-in instrument approach procedures;
 - (B) unusual local weather conditions, such as environmental features that can give rise to turbulence, windshear or unusual wind conditions;
 - (C) unusual characteristics or performance limitations, such as unusual runway characteristics in length, width, slope, markings or lighting that present an atypical visual perspective on approach;
 - (D) any other relevant considerations, including obstructions, physical layout, lighting, etc., such as restrictions on circling in certain sectors due to obstacles in the circling area;
 - (E) training or flight crew experience requirements stipulated by the competent authority responsible for the aerodrome that do not include instruction in an FSTD or visiting the aerodrome.
 - (iii) category C — an aerodrome:
 - (A) that requires additional considerations to those of a category B aerodrome; or
 - (B) for which flight crew experience or qualification requirements stipulated by the competent authority responsible for the aerodrome include instruction in an FSTD or visiting the aerodrome.

Offshore installations may be categorised as category B or C aerodromes, taking into account the limitations determined in accordance with [AMC1 SPA.HOFO.115](#) 'Use of offshore locations'.

- (c) Prior to operating to a category B aerodrome (planned destination or required alternate), the pilot-in-command/commander should:
 - (1) comply with any requirements stipulated by the competent authority responsible for the aerodrome; and
 - (2) be briefed, or self-brief by means of programmed instruction, about the additional considerations applicable to operations to that category B aerodrome. The completion of the briefing should be recorded. This recording may be accomplished after completion or confirmed by the pilot-in-command/commander before departure on a flight involving category B aerodrome(s) as destination or alternate aerodromes.
- (d) Prior to operating to a category C aerodrome (planned destination or required alternate), the pilot-in-command/commander should:
 - (1) comply with any requirements stipulated by the competent authority responsible for the aerodrome; and
 - (2) be briefed or self-brief by means of programmed instruction, about the additional considerations applicable to operations to that category C aerodrome; and
 - (3) visit the aerodrome as an observer and/or undertake instruction in a suitable FSTD. The observer should occupy an observer's seat where installed. If an observer's seat is not available and cannot be installed, the pilot-in-command/commander may occupy a pilot seat to conduct the aerodrome visit with a suitably qualified commander nominated by the category C aerodrome operator.

The completion of the briefing, visit and/or instruction should be recorded.

AMC2 ORO.FC.105(b)(2);(c) Designation as pilot-in-command/commander

ED Decision 2022/014/R

GENERAL

The operator should comply with the national training and checking requirements published in the AIP.

ROUTE, AREA AND AERODROME KNOWLEDGE FOR NON-COMMERCIAL OPERATIONS

The knowledge of the route and area to be flown and of the aerodrome facilities and procedures to be used should include the following:

- (a) Area and route knowledge
 - (1) The objective of the area and route familiarisation should be to ensure that the pilot has knowledge of:
 - (i) terrain and minimum safe altitudes;
 - (ii) seasonal meteorological conditions;
 - (iii) meteorological, communication and air traffic facilities, services and procedures;
 - (iv) search and rescue procedures where available; and
 - (v) navigational facilities associated with the area or route along which the flight is to take place.

- (2) The operations manual should describe appropriate methods of familiarisation depending on the complexity of the area or route and the experience of the pilot-in-command.
- (b) Aerodrome knowledge
- (1) Aerodrome familiarisation should include knowledge of obstructions, physical layout, lighting, approach aids and arrival, departure, holding and instrument approach procedures, applicable operating minima and ground movement considerations.
- (2) The operator's manual should describe appropriate methods of familiarisation depending on the complexity of the aerodrome.
- (3) If the competent authority of the aerodrome or area requires specific training or familiarisation, the operator should maintain all records of this training or familiarisation in accordance with [ORO.GEN.220](#).
- (4) For offshore installations, the limitations determined in accordance with [AMC1 SPA.HOFO.115](#) should be taken into account.

[applicable from 26 March 2023]

GM1 ORO.FC.105(b)(2) Route and aerodrome knowledge

ED Decision 2015/012/R

ENVIRONMENTAL KNOWLEDGE RELATED TO THE PREVENTION OF AEROPLANE UPSETS

The knowledge should include understanding of:

- (a) the relevant environmental hazards, such as:
- Clear Air Turbulence (CAT),
 - Intertropical Convergence Zone (ITCZ),
 - thunderstorms,
 - microbursts,
 - wind shear,
 - icing,
 - mountain waves,
 - wake turbulence, and
 - temperature changes at high altitude;
- (b) the evaluation and management of the associated risks of the relevant hazards in (a); and
- (c) the available mitigating procedures for the relevant hazards in (a) related to the specific route, route area, or aerodrome used by the operator.

GM2 ORO.FC.105(b)(2) Designation as pilot-in-command/commander

ED Decision 2022/014/R

AERODROME KNOWLEDGE FOR NON-COMMERCIAL OPERATIONS

The operator may, based on complexity, categorise all aerodromes in one of the following three categories:

- (a) category A — an aerodrome that meets all the following conditions:
 - (1) an approved instrument approach procedure;
 - (2) at least one runway with no performance-limited procedure for take-off and/or landing;
 - (3) published circling minima not higher than 1 000 ft above aerodrome level; and
 - (4) night operations capability.
- (b) category B — an aerodrome that does not meet the category A conditions or which requires extra considerations due to:
 - (1) non-standard approach aids and/or approach patterns;
 - (2) unusual local weather conditions;
 - (3) unusual characteristics or performance limitations;
 - (4) any other relevant considerations, including obstacles, physical layout, lighting, etc.
- (c) category C — an aerodrome that requires additional considerations to those of a category B aerodrome.

Offshore installations may be categorised as category B or C aerodromes, taking into account the limitations determined in accordance with [AMC1 SPA.HOFO.115](#) 'Use of offshore locations'.

[applicable from 26 March 2023]

AMC1 ORO.FC.105(b)(3) Designation as pilot-in-command/commander

ED Decision 2022/014/R

OPERATOR'S COMMAND COURSE FOR NON-COMMERCIAL OPERATIONS WITH COMPLEX MOTOR-POWERED AIRCRAFT (NCC)

- (a) For aeroplane and helicopter operations, when upgrading from co-pilot to pilot-in-command, the flight crew member should be trained at least on the following elements, as part of the command course:
 - (1) command responsibilities training;
 - (2) demonstration of competence operating as pilot-in-command.
- (b) Demonstration of competence operating as pilot-in-command may be achieved by:
 - (1) completing a proficiency check in the role of pilot-in-command; or
 - (2) operating at least one flight under the supervision and to the satisfaction of a suitably qualified pilot-in-command nominated by the operator.

[applicable from 26 March 2023]

AMC1 ORO.FC.105(c) Designation as pilot-in-command/commander

ED Decision 2022/014/R

ROUTE/AREA AND AERODROME RECENTRY

- (a) The 12-month period should be counted from the last day of the month:
 - (1) when the familiarisation training was undertaken; or
 - (2) of the latest operation on the route or area to be flown and of the aerodromes, facilities and procedures to be used.
- (b) The 36-month period should be counted from the last day of the month:
 - (1) when the familiarisation training was undertaken; or
 - (2) when the latest operation on the route or area was flown.

AMC2 ORO.FC.105(c) Designation as pilot-in-command/commander

ED Decision 2014/017/R

ROUTE/AREA AND AERODROME RECENTRY — PERFORMANCE CLASS B AEROPLANES OPERATED UNDER VFR BY NIGHT OR IFR IN CAT OPERATIONS AND COMMERCIAL OPERATIONS OTHER THAN CAT

In the case of CAT operations with performance class B aeroplanes operating under visual flight rules (VFR) by night or instrument flight rules (IFR), or commercial operations other than CAT, the knowledge should be maintained as follows:

- (a) except for operations to the most demanding aerodromes, by completion of at least 10 flight sectors within the area of operation during the preceding 12 months in addition to any required self-briefing;
- (b) operations to the most demanding aerodromes may be performed only if:
 - (1) the pilot-in-command/commander has been qualified at the aerodrome within the preceding 36 months by a visit as an operating flight crew member or as an observer;
 - (2) the approach is performed in visual meteorological conditions (VMC) from the applicable minimum sector altitude; and
 - (3) an adequate self-briefing has been made prior to the flight.

GM1 ORO.FC.105(c) Designation as pilot-in-command/commander

ED Decision 2022/014/R

AREA AND ROUTE FAMILIARISATION TRAINING DELIVERY

When developing the area and route familiarisation training, the operator may apply the following methodology:

- (a) Internal evidence
 - (1) Operator assessment by conducting an operational risk evaluation according to the following criteria:
 - (i) terrain and minimum safe altitudes;
 - (ii) seasonal meteorological conditions;
 - (iii) meteorological, communication and air traffic facilities, services and procedures;
 - (iv) search and rescue procedures where available; and

- (v) navigational facilities associated with the area or route along which the flight is to take place.
- (2) Operator-specific evidence gathered through the safety management process in accordance with ORO.GEN.200.
- (b) External evidence
 - (1) notices to airmen (NOTAMs);
 - (2) AIP.
- (c) When selecting the method and tool, operators should be driven by the objective of reaching the optimum in terms of the desired outcome, which is the maximum possible knowledge increase. This methodology intends that such selection is based on the type of the underlying risks of a route / area as determined in accordance with (a) and (b) and the learning objectives. For example: for the less complex areas or routes, familiarisation by self-briefing with route documentation, or by means of programmed instruction; and for the more complex areas or routes, in-flight familiarisation as a pilot-in-command/commander or co-pilot under supervision or an observer, or familiarisation in a flight simulation training device (FSTD) using a database appropriate to the route concerned.

AMC1 ORO.FC.105(d) Designation as pilot-in-command/commander

ED Decision 2022/014/R

AREA FAMILIARISATION TRAINING THAT INCLUDES ROUTE /AERODROME FAMILIARISATION — HELICOPTERS

- (a) The area familiarisation training for day VFR should ensure that a pilot is capable of selecting aerodromes and operating sites from the ground and from the air, and of establishing a safe flight path for landing and take-off.

AREA FAMILIARISATION TRAINING

- (b) The following areas and conditions should require specific area familiarisation training:
 - (1) mountain environment;
 - (2) offshore environment;
 - (3) complex airspace;
 - (4) areas that are regularly covered by snow and are prone to white-out phenomena during the cruise or landing phase; and
 - (5) other challenging areas or conditions.

GM1 ORO.FC.105(d) Designation as pilot-in-command/commander

ED Decision 2014/017/R

PERFORMANCE CLASS B AEROPLANES OPERATED UNDER VFR BY DAY IN CAT OPERATIONS

For CAT operations under VFR by day with performance class B aeroplanes, the operator should take account of any requirement that might be stipulated in specific cases by the State of the aerodrome.

ORO.FC.110 Flight engineer

Regulation (EU) No 965/2012

When a separate flight engineer station is incorporated in the design of an aeroplane, the flight crew shall include one crew member who is suitably qualified in accordance with applicable national rules.

ORO.FC.115 Crew resource management (CRM) training

Regulation (EU) No 965/2012

- (a) Before operating, the flight crew member shall have received CRM training, appropriate to his/her role, as specified in the operations manual.
- (b) Elements of CRM training shall be included in the aircraft type or class training and recurrent training as well as in the command course.

AMC1 ORO.FC.115 Crew resource management (CRM) training

ED Decision 2021/002/R

CRM TRAINING — MULTI-PILOT OPERATIONS

(a) General

(1) Training environment

CRM training should be conducted in the non-operational environment (classroom and computer-based) and in the operational environment (flight simulation training device (FSTD) including other training solutions described in CS-FSTD when available and aircraft. Tools such as group discussions, team task analysis, team task simulation and feedback should be used.

(2) Classroom training

Whenever possible, classroom training should be conducted in a group session away from the pressures of the usual working environment, so that the opportunity is provided for flight crew members to interact and communicate in an environment conducive to learning.

(3) Computer-based training (CBT)

Computer-based training should not be conducted as a stand-alone training method but may be conducted as a complementary training method.

Complementary training method in the context of EBT: advanced CBT following the aviation blended learning environment, such as virtual reality, chatbots, interactive scenario trainers, etc. may serve as the principal method to deliver training in the non-operational environment. In such case, the classroom training may be the complementary method.

(4) Flight simulation training devices (FSTDs)

Whenever practicable, parts of the CRM training should be conducted in FSTDs that reproduce a realistic operational environment and permit interaction. This includes but is not limited to line-oriented flight training (LOFT) scenarios.

[applicable until 25 March 2023 — ED Decision 2022/014/R]

(4) Flight simulation training devices (FSTDs)

- (i) Whenever practicable, parts of the CRM training should be conducted in FSTDs that reproduce a realistic operational environment and permit interaction. This includes but is not limited to line-oriented flight training (LOFT) scenarios.
- (ii) If the operator proficiency check is conducted in a FSTD, it should include a line-oriented flight during which a complementary CRM assessment should take place, in conditions that reproduce a realistic operational environment.

[applicable from 26 March 2023 — ED Decision 2022/014/R]

(5) Integration into flight crew training

CRM principles should be integrated into relevant parts of flight crew training and operations including checklists, briefings, abnormal and emergency procedures.

(6) Combined CRM training for flight crew, cabin crew and technical crew

- (i) Operators should provide combined training for flight crew, cabin crew and technical crew during recurrent CRM training.
- (ii) The combined training should address at least:
 - (A) effective communication, coordination of tasks and functions of flight crew, cabin crew and technical crew; and
 - (B) mixed multinational and cross-cultural flight crew, cabin crew and technical crew, and their interaction, if applicable.
- (iii) The combined training should be expanded to include medical passengers, if applicable to the operation.
- (iv) Combined CRM training should be conducted by flight crew CRM trainer or cabin crew CRM trainer.
- (v) There should be an effective liaison between flight crew, cabin crew and technical crew training departments. Provision should be made for transfer of relevant knowledge and skills between flight crew, cabin crew and technical crew CRM trainers.

(7) Management system

CRM training should address hazards and risks identified by the operator's management system described in [ORO.GEN.200](#).

(8) Competency-based CRM training

- (i) Whenever practicable, the compliance-based approach concerning CRM training may be substituted by a competency-based approach such as evidence-based training. In this context, CRM training should be characterised by a performance orientation, with emphasis on standards of performance and their measurement, and the development of training to the specified performance standards.
- (ii) CRM training should be an essential element of the alternative training and qualification programme (ATQP) described in [ORO.FC.A.245](#), when the operator applies ATQP.

(9) Contracted CRM training

If the operator chooses not to establish its own CRM training, another operator, a third party or a training organisation may be contracted to provide the training in accordance with [ORO.GEN.205](#). In case of contracted CRM training, the operator should ensure that the content of the course covers the specific culture, the type of operations and the associated procedures of the operator. When crew members from different operators attend the same course, the CRM training should be specific to the relevant flight operations and to the trainees concerned.

(b) Initial operator's CRM training

(1) The flight crew member should complete the initial operator's CRM training once. When the type of operation of a new operator is not different, the new operator should not be required to provide the initial operator's CRM training to this flight crew member a second time.

(2) The initial training should cover all elements specified in Table 1 of (g).

(c) Operator conversion course — CRM training

When the flight crew member undertakes a conversion course with a change of aircraft type or change of operator, elements of CRM training should be integrated into all appropriate phases of the operator's conversion course, as specified in Table 1 of (g).

[applicable until 25 March 2023 — ED Decision 2022/014/R]

When the flight crew member undertakes a conversion course with a change of aircraft type or when joining an operator, elements of CRM training should be integrated into all appropriate phases of the operator's conversion course, as specified in Table 1 of (g).

[applicable from 26 March 2023 — ED Decision 2022/014/R]

(d) Annual recurrent CRM training

(1) Annual recurrent CRM training should be provided in such a way that all CRM training elements specified for the annual recurrent training in Table 1 of (g) are covered over a period not exceeding 3 years.

(2) Operators should update their CRM recurrent training programme over a period not exceeding 3 years. The revision of the programme should take into account information from the operator's management system including the results of the CRM assessment.

(e) Command course — CRM training

The operator should ensure that elements of CRM training are integrated into the command course, as specified in Table 1 of (g).

(f) Training elements

The CRM training elements to be covered are specified in Table 1 of (g). The operator should ensure that the following aspects are addressed:

(1) Automation and philosophy on the use of automation

(i) The CRM training should include training in the use and knowledge of automation, and in the recognition of systems and human limitations associated with the use of automation. The operator should, therefore, ensure that the flight crew member receives training on:

- (A) the application of the operations policy concerning the use of automation as stated in the operations manual; and
 - (B) system and human limitations associated with the use of automation, giving special attention to issues of mode awareness, automation surprises and over-reliance including false sense of security and complacency.
 - (ii) The objective of this training should be to provide appropriate knowledge, skills and attitudes for managing and operating automated systems. Special attention should be given to how automation increases the need for crews to have a common understanding of the way in which the system performs, and any features of automation that make this understanding difficult.
 - (iii) If conducted in an FSTD, the training should include automation surprises of different origin (system- and pilot-induced).
- (2) Monitoring and intervention
- Flight crew should be trained in CRM-related aspects of operation monitoring before, during and after flight, together with any associated priorities. This CRM training should include guidance to the pilot monitoring on when it would be appropriate to intervene, if felt necessary, and how this should be done in a timely manner. Reference should be made to the operator procedures for structured intervention as specified in the operations manual.
- (3) Resilience development
- CRM training should address the main aspects of resilience development. The training should cover:
- (i) Mental flexibility

Flight crew should be trained to:

 - (A) understand that mental flexibility is necessary to recognise critical changes;
 - (B) reflect on their judgement and adjust it to the unique situation;
 - (C) avoid fixed prejudices and over-reliance on standard solutions; and
 - (D) remain open to changing assumptions and perceptions.
 - (ii) Performance adaptation

Flight crew should be trained to:

 - (A) mitigate frozen behaviours, overreactions and inappropriate hesitation; and
 - (B) adjust actions to current conditions.
- (4) Surprise and startle effect
- CRM training should address unexpected, unusual and stressful situations. The training should cover:
- (i) surprises and startle effects; and
 - (ii) management of abnormal and emergency situations, including:
 - (A) the development and maintenance of the capacity to manage crew resources;

- (B) the acquisition and maintenance of adequate automatic behavioural responses; and
 - (C) recognising the loss and re-building situation awareness and control.
- (5) Cultural differences

CRM training should cover cultural differences of multinational and cross-cultural crews. This includes recognising that:

 - (i) different cultures may have different communication specifics, ways of understanding and approaches to the same situation or problem;
 - (ii) difficulties may arise when crew members with different mother tongue communicate in a common language which is not their mother tongue; and
 - (iii) cultural differences may lead to different methods for identifying a situation and solving a problem.
- (6) Operator's safety culture and company culture

CRM training should cover the operator's safety culture, its company culture, the type of operations and the associated procedures of the operator. This should include areas of operations that may lead to particular difficulties or involve unusual hazards.
- (7) Case studies
 - (i) CRM training should cover aircraft type-specific case studies, based on the information available within the operator's management system, including:
 - (A) accident and serious incident reviews to analyse and identify any associated non-technical causal and contributory factors, and instances or examples of lack of CRM; and
 - (B) analysis of occurrences that were well managed.
 - (ii) If relevant aircraft type-specific or operator-specific case studies are not available, the operator should consider other case studies relevant to the scale and scope of its operations.
- (g) CRM training syllabus

Table 1 below specifies which CRM training elements should be covered in each type of training. The levels of training in Table 1 can be described as follows:

 - (1) 'Required' means training that should be instructional or interactive in style to meet the objectives specified in the CRM training programme or to refresh and strengthen knowledge gained in a previous training.
 - (2) 'In-depth' means training that should be instructional or interactive in style taking full advantage of group discussions, team task analysis, team task simulation, etc., for the acquisition or consolidation of knowledge, skills and attitudes. The CRM training elements should be tailored to the specific needs of the training phase being undertaken.

Table 1: Flight crew CRM training

CRM training elements	Initial operator's CRM training	Operator conversion course when changing aircraft type	Operator conversion course when changing operator	Annual recurrent training	Command course
General principles					
Human factors in aviation; General instructions on CRM principles and objectives; Human performance and limitations; Threat and error management.	In-depth	Required	Required	Required	Required
Relevant to the individual flight crew member					
Personality awareness, human error and reliability, attitudes and behaviours, self-assessment and self-critique; Stress and stress management; Fatigue and vigilance; Assertiveness, situation awareness, information acquisition and processing.	In-depth	Not required	Not required	Required	In-depth
Relevant to the flight crew					
Automation and philosophy on the use of automation	Required	In-depth	In-depth	In-depth	In-depth
Specific type-related differences	Required	In-depth	Not required	Required	Required

[Table 1 applicable from 26 March 2023 — ED Decision 2022/014/R]

(h) Assessment of CRM skills

- (1) Assessment of CRM skills is the process of observing, recording, interpreting and debriefing crews and crew member's performance using an accepted methodology in the context of the overall performance.
- (2) The flight crew member's CRM skills should be assessed in the operational environment, but not during CRM training in the non-operational environment. Nevertheless, during training in the non-operational environment, feedback from the flight crew CRM trainer or from trainees on individual and crew performance may be given to the crew members concerned.
- (3) The assessment of CRM skills should:
 - (i) include debriefing the crew and the individual crew member;
 - (ii) serve to identify additional training, where needed, for the crew or the individual crew member; and
 - (iii) be used to improve the CRM training system by evaluating de-identified summaries of all CRM assessments.
- (4) Prior to the introduction of CRM skills assessment, a detailed description of the CRM methodology, including the required CRM standards and the terminology used for the assessment, should be published in the operations manual.
- (5) Methodology of CRM skills assessment

The assessment should be based on the following principles:

 - (i) only observable behaviours are assessed;
 - (ii) the assessment should positively reflect any CRM skills that result in enhanced safety; and
 - (iii) assessments should include behaviour that results in an unacceptable reduction in safety margin.
- (6) Operators should establish procedures, including additional training, to be applied in the event that flight crew members do not achieve or maintain the required CRM standards.

AMC2 ORO.FC.115 Crew resource management (CRM) training

ED Decision 2022/014/R

CRM TRAINING — SINGLE-PILOT OPERATIONS

- (a) For single-pilot helicopter operations with technical crew, [AMC1 ORO.FC.115](#) should be applied.
- (b) For single-pilot operations other than those specified in (a), [AMC1 ORO.FC.115](#) should be applied with the following differences:
 - (1) Relevant training

Training should cover the relevant CRM training, i.e. initial operator's training, the operator conversion course and recurrent training.
 - (2) Relevant training elements

CRM training should focus on the elements specified in Table 1 of (g) of [AMC1 ORO.FC.115](#) which are relevant to single-pilot operations. Therefore, single-pilot CRM training should include, among others:

- (i) situation awareness;
 - (ii) workload management;
 - (iii) decision-making;
 - (iv) resilience development;
 - (v) surprise and startle effect; and
 - (vi) effective communication and coordination with other operational personnel and ground services.
- (3) Virtual classroom training
- Notwithstanding (a)(2) of [AMC1 ORO.FC.115](#), classroom training may take place remotely, using a videoconferencing tool. The tool should permit real-time interaction between the trainees and the trainer, including speech and elements of body language. It should also be capable of transmitting any document to the trainee that the trainer wishes to present. The CRM trainer should establish the list of trainees in advance. Their numbers should be limited to 6 to ensure a sufficient level of interaction during the training session.
- (4) Operation with ELA2 aircraft.
- Notwithstanding (1) and (2), for operations with ELA2 aircraft the relevant CRM training and its duration should be determined by the operator, based on the aircraft type and the complexity of the operation.

AMC3 ORO.FC.115 Crew resource management (CRM) training

ED Decision 2015/022/R

FLIGHT CREW CRM TRAINER

(a) Applicability

The provisions described herein:

- (1) should be fulfilled by flight crew CRM trainers responsible for classroom CRM training; and
- (2) are not applicable to:
 - (i) instructors, holding a certificate in accordance with Commission Regulation (EU) No 1178/2011, who conduct CRM training in the operational environment; and
 - (ii) trainers or instructors conducting training other than CRM training, but integrating CRM elements into this training.

(b) Qualification of flight crew CRM trainer

- (1) A training and standardisation programme for flight crew CRM trainers should be established.
- (2) A flight crew CRM trainer, in order to be suitably qualified, should:
 - (i) have adequate knowledge of the relevant flight operations;
 - (ii) have adequate knowledge of human performance and limitations (HPL), whilst:
 - (A) having obtained a commercial pilot licence in accordance with Commission Regulation (EU) No 1178/2011; or

- (B) having followed a theoretical HPL course covering the whole syllabus of the HPL examination;
 - (iii) have completed flight crew initial operator's CRM training;
 - (iv) have received training in group facilitation skills;
 - (v) have received additional training in the fields of group management, group dynamics and personal awareness; and
 - (vi) have demonstrated the knowledge, skills and credibility required to train the CRM training elements in the non-operational environment, as specified in Table 1 of [AMC1 ORO.FC.115](#).
- (3) The following qualifications and experiences are also acceptable for a flight crew CRM trainer in order to be suitably qualified:
 - (i) A flight crew member holding a recent qualification as a flight crew CRM trainer may continue to be a flight crew CRM trainer after the cessation of active flying duties if he/she maintains adequate knowledge of the relevant flight operations.
 - (ii) A former flight crew member may become a flight crew CRM trainer if he/she maintains adequate knowledge of the relevant flight operations and fulfils the provisions of (2)(ii) to (2)(vi).
 - (iii) An experienced CRM trainer may become a flight crew CRM trainer if he/she demonstrates adequate knowledge of the relevant flight operations and fulfils the provisions of (2)(ii) to (2)(vi).
- (c) Training of flight crew CRM trainer
 - (1) Training of flight crew CRM trainers should be both theoretical and practical. Practical elements should include the development of specific trainer skills, particularly the integration of CRM into line operations.
 - (2) The basic training of flight crew CRM trainers should include the training elements for flight crew, as specified in Table 1 of [AMC1 ORO.FC.115](#). In addition, the basic training should include the following:
 - (i) introduction to CRM training;
 - (ii) operator's management system;
 - (iii) characteristics, as applicable:
 - (A) of the different types of CRM trainings (initial, recurrent, etc.);
 - (B) of combined training; and
 - (C) related to the type of aircraft or operation; and
 - (iv) assessment.
 - (3) The refresher training of flight crew CRM trainers should include new methodologies, procedures and lessons learned.
 - (4) Instructors, holding a certificate in accordance with Commission Regulation (EU) No 1178/2011, who are also CRM trainers, may combine the CRM trainer refresher training with instructor refresher training.

- (5) Instructors for other-than complex motor-powered aircraft should be qualified as flight crew CRM trainers for this aircraft category with no additional training, as specified in (2) and (3) when:
 - (i) holding a certificate in accordance with Commission Regulation (EU) No 1178/2011; and
 - (ii) fulfilling the provisions of (b)(2) or (b)(3).
 - (6) The training of flight crew CRM trainers should be conducted by flight crew CRM trainers with a minimum of 3 years' experience. Assistance may be provided by experts in order to address specific areas.
- (d) Assessment of flight crew CRM trainer
- (1) A flight crew CRM trainer should be assessed by the operator when conducting the first CRM training course. This first assessment should be valid for a period of 3 years.
 - (2) The operator should ensure that the process for the assessment is included in the operations manual describing methods for observing, recording, interpreting and debriefing the flight crew CRM trainer. All personnel involved in the assessment must be credible and competent in their role.
- (e) Recency and renewal of qualification as flight crew CRM trainer
- (1) For recency of the 3-year validity period, the flight crew CRM trainer should:
 - (i) conduct at least 2 CRM training events in any 12-month period;
 - (ii) be assessed within the last 12 months of the 3-year validity period by the operator; and
 - (iii) complete CRM trainer refresher training within the 3-year validity period.
 - (2) The next 3-year validity period should start at the end of the previous period.
 - (3) For renewal, i.e. when a flight crew CRM trainer does not fulfil the provisions of (1), he/she should, before resuming as flight crew CRM trainer:
 - (i) comply with the qualification provisions of (b) and (d); and
 - (ii) complete CRM trainer refresher training.

[applicable until 25 March 2023 — ED Decision 2022/014/R]

GM1 ORO.FC.115 Crew resource management (CRM) training

ED Decision 2015/022/R

GENERAL

- (a) CRM is the effective utilisation of all available resources (e.g. crew members, aircraft systems, supporting facilities and persons) to achieve safe and efficient operation.
- (b) The objective of CRM is to enhance the communication and management skills of the flight crew member concerned. Emphasis is placed on the non-technical knowledge, skills and attitudes of flight crew performance.

GM2 ORO.FC.115 Crew resource management (CRM) training

ED Decision 2015/022/R

TRAINING ENVIRONMENT, TRAINERS AND INSTRUCTORS

- (a) Flight crew CRM training can be separated as follows:
 - (1) training in the non-operational environment:
 - (i) classroom; and
 - (ii) computer-based;
 - (2) training in the operational environment:
 - (i) flight simulation training device (FSTD); and
 - (ii) aircraft.
- (b) In general, CRM training is provided as follows:
 - (1) classroom training by a flight crew CRM trainer;
 - (2) training in the operational environment by an instructor holding a certificate in accordance with Commission Regulation (EU) No 1178/2011;
 - (3) computer-based training as a self-study training method. If needed, directions concerning CRM-related issues are provided by a flight crew CRM trainer or by an instructor holding a certificate in accordance with Commission Regulation (EU) No 1178/2011.

GM3 ORO.FC.115 Crew resource management (CRM) training

ED Decision 2022/014/R

MINIMUM TRAINING TIMES

- (a) The following minimum training times are appropriate:
 - (1) multi-pilot operations:
 - (i) combined CRM training: 6 training hours over a period of 3 years, or, for EBT operators, a minimum of 3 training hours within 3 years; and
 - (ii) initial operator's CRM training: 18 training hours with a minimum of 12 training hours in classroom training;
 - (2) initial operator's CRM training for single-pilot operations: 6 training hours; and
 - (3) flight crew CRM trainer:
 - (i) basic training:
 - (A) 18 training hours for trainees holding an instructor certificate for complex motor-powered aircraft, as specified in Commission Regulation (EU) No 1178/2011, which includes 25-hour training in teaching and learning; or
 - (B) 30 training hours for trainees who do not hold an instructor certificate as specified in (A); and
 - (ii) refresher training: 6 training hours.

- (b) ‘Training hours’ means actual training time excluding breaks and assessment.

GM4 ORO.FC.115 Crew resource management (CRM) training

ED Decision 2015/022/R

DESIGN, IMPLEMENTATION AND EVALUATION OF CRM TRAINING

The checklist in Table 1 provides guidance on the design, implementation and evaluation of CRM training, and on their incorporation into the operator’s safety culture. Elements of the operator’s management systems and the competency-based approach are incorporated in the checklist.

Table 1 — Checklist for design, implementation, evaluation and incorporation of CRM training

Step No	Description	Element
1	Needs analysis	Determine the necessary CRM competencies
		Develop CRM training goals
		Ensure the organisation is ready for CRM training
2	Design	Develop CRM training objectives
		Determine what to measure and how to measure it
3	Development	Describe the CRM learning environment
		Develop full-scale prototype of training
		Validate and modify CRM training
4	Implementation	Prepare trainees and environment
		Set a climate for learning (e.g. practice and feedback)
		Implement the CRM training programme
5	Evaluation	Determine training effectiveness
		Evaluate CRM training at multiple levels
		Revise the CRM training programme to improve effectiveness
6	Incorporation	Establish an environment where CRM training is positively recognised
		Reinforce CRM behaviours in daily work
		Provide recurrent CRM training

GM5 ORO.FC.115 Crew resource management (CRM) training

ED Decision 2015/022/R

RESILIENCE DEVELOPMENT

- (a) The main aspects of resilience development can be described as the ability to:
- (1) learn (‘knowing what has happened’);
 - (2) monitor (‘knowing what to look for’);
 - (3) anticipate (‘finding out and knowing what to expect’); and
 - (4) respond (‘knowing what to do and being capable of doing it’).
- (b) Operational safety is a continuous process of evaluation of and adjustment to existing and future conditions. In this context, and following the description in (a), resilience development involves an ongoing and adaptable process including situation assessment, self-review, decision and action. Training in resilience development enables crew members to draw the right conclusions from both positive and negative experiences. Based on those experiences, crew

members are better prepared to maintain or create safety margins by adapting to dynamic complex situations.

- (c) The training topics in (f)(3) of [AMC1 ORO.FC.115](#) are to be understood as follows:
- (1) Mental flexibility
 - (i) The phrase 'understand that mental flexibility is necessary to recognise critical changes' means that crew members are prepared to respond to situations for which there is no set procedure.
 - (ii) The phrase 'reflect on their judgement and adjust it to the unique situation' means that crew members learn to review their judgement based on the unique characteristics of the given circumstances.
 - (iii) The phrase 'avoid fixed prejudices and over-reliance on standard solutions' means that crew members learn to update solutions and standard response sets, which have been formed on prior knowledge.
 - (iv) The phrase 'remain open to changing assumptions and perceptions' means that crew members constantly monitor the situation, and are prepared to adjust their understanding of the evolving conditions.
 - (2) Performance adaptation
 - (i) The phrase 'mitigate frozen behaviours, overreactions and inappropriate hesitation' means that crew members correct improper actions with a balanced response.
 - (ii) The phrase 'adjust actions to current conditions' means that crew members' responses are in accordance with the actual situation.

GM6 ORO.FC.115 Crew resource management (CRM) training

ED Decision 2015/022/R

NON-TECHNICAL SKILLS ASSESSMENT

- (a) NOTECHS (non-technical skills) is a validated method for assessing flight crew CRM skills.

The NOTECHS framework consists of four main categories:

- (1) Cooperation: Cooperation is the ability to work effectively in a crew.
 - (2) Leadership and managerial skills: Effective leadership and managerial skills help to achieve joint task completion within a motivated, fully functioning team through coordination and persuasiveness.
 - (3) Situation awareness: Situation awareness relates to one's ability to accurately perceive what is in the flight crew compartment and outside the aircraft. It is also one's ability to comprehend the meaning of different elements in the environment and the projection of their status in the near future.
 - (4) Decision-making: Decision-making is the process of reaching a judgement or choosing an option.
- (b) Each of the four categories is subdivided into elements and behavioural markers. The elements are specified in Table 1 with examples of behavioural markers (effective behaviour). The behavioural markers are assessed by a rating scale to be established by the operator.

Table 1 — Categories, elements and behavioural markers of NOTESHS

Category	Element	Behavioural marker (examples)
Cooperation	Team building and maintaining	Establishes atmosphere for open communication and participation
	Considering others	Takes condition of other crew members into account
	Supporting others	Helps other crew members in demanding situations
	Conflict solving	Concentrates on what is right rather than who is right
Leadership and managerial skills	Use of authority and assertiveness	Takes initiative to ensure crew involvement and task completion
	Maintaining standards	Intervenes if task completion deviates from standards
	Planning and coordination	Clearly states intentions and goals
	Workload management	Allocates adequate time to complete tasks
Situation awareness	Awareness of aircraft systems	Monitors and reports changes in systems' states
	Awareness of external environment	Collects information about environment (position, weather and traffic)
	Anticipation	Identifies possible future problems
Decision-making	Problem definition and diagnosis	Reviews causal factors with other crew members
	Option generation	States alternative courses of action
		Asks other crew members for options
	Risk assessment and option selection	Considers and shares estimated risk of alternative courses of action
	Outcome review	Checks outcome against plan

GM7 ORO.FC.115 Crew resource management (CRM) training

ED Decision 2015/022/R

FLIGHT CREW CRM TRAINER ASSESSMENT

- For assessing flight crew CRM trainers, the operator may nominate experienced flight crew CRM trainers who have demonstrated continued compliance with the provisions for a flight crew CRM trainer and capability in that role for at least 3 years.
- An operator that does not have the resources to conduct the assessment may employ a contractor. The standard as regards the assessment is confirmed on a 3-year basis by the operator.
- The checklist in Table 1 provides guidance on the assessment of a flight crew CRM trainer. If a flight crew CRM trainer is competent in his/her role, the response to the questions in Table 1 should be 'yes'. When answering the questions in Table 1, justifications and examples related to the responses given should be provided.

Table 1 — Flight crew CRM trainer assessment checklist

Questions to assess a flight crew CRM trainer	Response yes/no
Did the CRM trainer demonstrate the knowledge required for the role?	
Did the CRM trainer support CRM concepts?	
Did the CRM trainer encourage trainees to participate, share their experiences and self-analyse?	

Did the CRM trainer identify and respond to the trainees' needs relative to expertise/experience?	
Did the CRM trainer show how CRM is integrated in technical training and line operations?	
Did the CRM trainer incorporate company CRM standards when appropriate?	
Did the CRM trainer identify and discuss the non-technical reasons involved in accidents, incidents and events included in case studies?	
Did the CRM trainer regularly check for understanding and resolve ambiguities?	
Did the CRM trainer demonstrate effective instruction and facilitation skills?	

GM8 ORO.FC.115 Crew resource management (CRM) training

ED Decision 2022/014/R

VIRTUAL CLASSROOM TRAINING — SINGLE-PILOT OPERATIONS

- (a) A successful virtual classroom training relies on the ability of the trainer to make best use of the associated technologies in the context of CRM training. The flight crew CRM trainer may need to receive appropriate training covering the following:
 - (1) learning style;
 - (2) teaching method associated with virtual classroom instruction, such as videoconferencing, and a familiarisation with the virtual classroom instruction system in use, including management of time, training media and equipment and tools.
- (b) The assessment of CRM skills may be used by the operator to improve the CRM training system by evaluating de-identified summaries of all CRM assessments.
- (c) The requirement of [ORO.GEN.140](#) for the operator to grant access to the competent authority also applies to the virtual classroom training.
- (d) More information on virtual classroom training is provided in the EASA Guidance for allowing virtual classroom instruction and distance learning.

ORO.FC.120 Operator conversion training

Regulation (EU) No 965/2012

- (a) In the case of aeroplane or helicopter operations, the flight crew member shall complete the operator conversion training course before commencing unsupervised line flying:
 - (1) when changing to an aircraft for which a new type or class rating is required;
 - (2) when joining an operator.
- (b) The operator conversion training course shall include training on the equipment installed on the aircraft as relevant to flight crew members' roles.

AMC1 ORO.FC.120 Operator conversion training

ED Decision 2022/014/R

OPERATOR CONVERSION TRAINING FOR NON-COMMERCIAL OPERATIONS WITH COMPLEX MOTOR-POWERED AIRCRAFT (NCC)

- (a) General
 - (1) The operator conversion training should include:

- (i) ground training, including the following:
 - (A) aircraft systems;
 - (B) normal procedures, which include flight planning, ground-handling and flight operations, including performance, mass and balance, fuel schemes, selection of alternates, and ground de-icing/anti-icing;
 - (C) abnormal and emergency procedures, which include pilot incapacitation, as applicable;
 - (D) a review of relevant samples of accidents/incidents and occurrences to increase awareness of the occurrences that may be relevant for the intended operation;
 - (ii) emergency and safety equipment training and checking, including survival equipment training (completed before operating on any passenger-carrying flight);
 - (iii) passenger handling for operations where no cabin crew is carried; and
 - (iv) a minimum number of sectors and/or flight hours operated under the supervision of a flight crew member nominated by the operator, to demonstrate the standard of qualification specified in the operator's manual.
- (2) The operator conversion course may be combined with a new type rating course, as required by [Commission Regulation \(EU\) No 1178/2011](#).
- (3) The conversion training should ensure that each flight crew member:
- (i) has been trained to competency on the emergency and safety equipment installed on the aircraft they are to operate; and
 - (ii) is competent in the operating procedures and the use of checklists used by the operator.
- (b) Emergency and safety equipment training should:
- (1) take place in conjunction with cabin crew and technical crew as far as practicable. Emphasis should be placed on the importance of effective coordination and two-way communication between crew members in various emergency situations;
 - (2) address the operational procedures of rescue and emergency services; and
 - (3) cover the items of point (a)(2) of [AMC1 ORO.FC.130](#).

[applicable from 26 March 2023 — ED Decision 2022/014/R]

AMC2 ORO.FC.120 Operator conversion training

ED Decision 2022/014/R

FORM OF OPERATIONS — SINGLE-PILOT HELICOPTERS

The training for conversion from single-pilot operations to multi-pilot operations and vice versa on a given helicopter type, as specified in point FCL.725(d)(2) of Annex I (Part-FCL) to [Regulation \(EU\) No 1178/2011](#), should take into account all of the following:

- (a) the SOPs of the operator;
- (b) the flight crew member's previous trainings and experience.

AMC3 ORO.FC.120 Operator conversion training

ED Decision 2022/014/R

SPO OPERATOR CONVERSION COURSE — GROUND TRAINING

(a) General

The operator conversion training should include ground training and checking, including all of the following:

- (1) aircraft systems,
- (2) normal procedures, which include flight planning ground-handling and flight operations, including performance, mass and balance, fuel schemes selection of alternates, and ground de-icing/anti-icing;
- (3) abnormal and emergency procedures, which include pilot incapacitation as applicable;
- (4) a review of relevant samples of accident/incident and occurrences to increase awareness of the occurrences that may be relevant for the intended operation.

SPECIALISED OPERATIONS

If a flight crew member undergoes training with regard to SOPs related to a specialised operation, either as part of an equipment and procedure training or a conversion training, the following should apply:

(b) Initial training for a given specialised operation

- (1) In-depth training should achieve competence in carrying out normal, abnormal and emergency procedures, covering the SOPs associated with the specialised task.
- (2) The training should include ground training associated with the specialised task, completed before any flight training in an aircraft commences.
- (3) If one or more task specialists are on board, the training should include emergency and safety equipment training, completed before any flight training in an aircraft commences. The training should ensure that all emergency equipment can be used timely and efficiently, that an emergency evacuation and first aid can be conducted, taking into account the training and operating procedures of the task specialist(s).
- (4) Unless the flight crew member has significant experience in similar specialised operations as defined in the operations manual, the training should include aircraft/FSTD training associated with the specialised task.

(c) Initial training and experience for any level of HEC and HESLO operations: [AMC1 SPO.SPEC.HEC.100](#) and [AMC1 SPO.SPEC.HESLO.100](#) should apply in combination with point (b) above.

(d) Training when changing operators

- (1) The training should focus on the elements of the SOPs that are specific to the operator.
- (2) The operator should determine the amount of training required in the operator's conversion course in accordance with the standards of qualification and experience specified in the operations manual, taking into account the flight crew member's previous training and experience in the given specialised operation and in similar operations.

(e) Training when changing specialised operations within the same operator, with previous experience of the specialised operation: point (d) above should apply.

- (f) Training when changing types or variants: The training should focus on the elements of the SOPs that are specific to the type or variant. The operator should assess whether the flight crew should require ground training, aircraft/FSTD training or both, when changing type or variants within the framework of the same specialised operations. The assessment should take the following into account:
- (1) the validity of the flight crew type rating;
 - (2) the experience and recency of the flight crew on the type or variant;
 - (3) whether any type or variant specific procedures exist;
 - (4) differences in equipment related to the specialised operations;
 - (5) differences in limitations or procedures related to the specialised operations.

[applicable from 26 March 2023 — ED Decision 2022/014/R]

GM1 ORO.FC.120 Operator conversion training

ED Decision 2022/014/R

STANDARD OPERATING PROCEDURES FOR MULTI-PILOT OPERATIONS — SINGLE-PILOT HELICOPTERS

MCC training is generic to all types. A pilot holding a certificate of completion of MCC training requires additional training to implement the multi-pilot SOPs of a given helicopter type.

AMC1 ORO.FC.120&130 Operator conversion training and checking & recurrent training and checking

ED Decision 2019/005/R

FLIGHT PATH MANAGEMENT (MANUAL OR AUTOMATIC, AS APPROPRIATE) DURING UNRELIABLE AIRSPEED INDICATION AND OTHER FAILURES AT HIGH ALTITUDE IN AEROPLANES WITH A MAXIMUM CRUISING ALTITUDE ABOVE FL300

For the operation of aeroplanes with a maximum cruising altitude above FL300, training elements from the following table should be integrated into:

- (a) operator conversion training; and
- (b) recurrent training at least every 12 calendar months, such that all elements are covered over a period not exceeding 3 years:

Element	Theoretical Knowledge	Practical training
Basic flight physics principles concerning flight at high altitude, with a particular emphasis on the relative proximity of the critical Mach number and the stall, pitch behaviour, and an understanding of the reduced stall angle of attack when compared with low-altitude flight.	•	•
Interaction of the automation (autopilot, flight director, auto-throttle/auto-thrust) and the consequences of failures inducing disconnection of the automation.	•	•
Consequences of an unreliable airspeed indication and other failures at high altitude and the need for the flight crew to promptly identify the failure and react with appropriate (minimal) control inputs to keep the aircraft in a safe envelope.	•	•

Degradation of fly-by-wire (FBW) flight control laws/modes and its consequence on aircraft stability and flight envelope protections, including stall warnings.	•	•
Practical training, using appropriate simulators, on manual handling at high altitude in normal and non-normal flight control laws/modes, with particular emphasis on pre-stall buffet, the reduced stall angle of attack when compared with low-altitude flight and the effect of pitch inputs on the aircraft trajectory and energy state.		•
The requirement to promptly and accurately apply the stall recovery procedure, as provided by the aircraft manufacturer, at the first indication of an impending stall. Differences between high-altitude and low-altitude stalls must be addressed.	•	•
Procedures for taking over and transferring manual control of the aircraft, especially for FBW aeroplanes with independent side-sticks.	•	•
Task sharing and crew coordination in high workload/stress conditions with appropriate call-out and acknowledgement to confirm changes to the aircraft flight control law/mode.	•	•

ORO.FC.125 Differences training, familiarisation, equipment and procedure training

Regulation (EU) 2021/2237

- (a) Flight crew members shall complete differences training or familiarisation when required by Annex I (Part- FCL) to [Regulation \(EU\) No 1178/2011](#).
- (b) Flight crew members shall complete equipment and procedure training when changing equipment or changing procedures requiring additional knowledge on types or variants currently operated.
- (c) The operations manual shall specify when such differences training or familiarisation or equipment and procedure training is required.

AMC1 ORO.FC.125 Differences training, familiarisation, equipment and procedure training

ED Decision 2022/014/R

GENERAL

- (a) Differences training requires additional knowledge and training on the aircraft or an appropriate training device. It should be carried out:
 - (1) in the case of aeroplanes, when operating another variant of an aeroplane of the same type or another type of the same class currently operated; or
 - (2) in the case of helicopters, when operating a variant of a helicopter currently operated.
- (b) Familiarisation requires only the acquisition of additional knowledge. It should be carried out when operating another helicopter or aeroplane of the same type.

AMC2 ORO.FC.125 Differences training, familiarisation, equipment and procedure training

ED Decision 2022/014/R

OPERATOR DIFFERENCE REQUIREMENTS (ODRs)

When defining the needs for differences training, familiarisation or equipment training, the operator should make use of the concept of ODRs and of the methodology described in [AMC1 ORO.FC.140\(a\)](#), including the ODRs tables.

FORM OF OPERATIONS — SINGLE-PILOT HELICOPTERS

If the differences training, familiarisation, equipment or procedure training includes the conversion from single-pilot operations to multi-pilot operations and vice versa, it should take into account all elements described in [AMC2 ORO.FC.120](#).

GM1 ORO.FC.125 Differences training, familiarisation, equipment and procedure training

ED Decision 2022/014/R

OPERATOR DIFFERENCE REQUIREMENTS (ODRs)

The ODRs tables may result in different training programmes, depending on the training needs, regardless of the 'base aircraft' used to establish the table (e.g. the trainee may know the 'other aircraft' and be trained towards the 'base aircraft').

AMC1 ORO.FC.125(b) Differences training, familiarisation, equipment and procedure training

ED Decision 2022/014/R

SPECIALISED OPERATIONS

If the differences training, familiarisation, equipment and procedure training includes training for SOPs related to a specialised operation, points (b) to (f) of [AMC3 ORO.FC.120](#) should apply.

[applicable from 26 March 2023]

GM1 ORO.FC.125(b) Differences training, familiarisation, equipment and procedure training

ED Decision 2022/014/R

GENERAL

Introducing a change of equipment and/or procedures on types or variants currently operated may require additional knowledge or additional training on the aircraft, or an appropriate training device, or both.

GM2 ORO.FC.125(b) Differences training, familiarisation, equipment and procedure training

ED Decision 2022/014/R

PROCEDURE TRAINING — STANDARD OPERATING PROCEDURES FOR MULTI-PILOT OPERATIONS — SINGLE-PILOT HELICOPTERS

MCC training is generic to all types. A pilot holding a certificate of completion of MCC training requires additional procedures training to implement the multi-pilot SOPs of a given single-pilot helicopter type.

ORO.FC.130 Recurrent training and checking

Regulation (EU) 2021/2237

- (a) Each flight crew member shall complete annual recurrent flight and ground training relevant to the type or variant, and associated equipment of aircraft on which he or she operates, including training on the location and use of all emergency and safety equipment carried on board the aircraft.
- (b) Each flight crew member shall be periodically checked to demonstrate competence in carrying out normal, abnormal and emergency procedures.

AMC1 ORO.FC.130 Recurrent training and checking

ED Decision 2022/014/R

RECURRENT TRAINING AND CHECKING TO DEMONSTRATE COMPETENCE FOR NON-COMMERCIAL OPERATIONS WITH COMPLEX MOTOR-POWERED AIRCRAFT (NCC)

- (a) Recurrent training

Recurrent training should comprise the following:

- (1) Ground training

The ground training programme should include:

- (i) aircraft systems;
- (ii) normal procedures, which include flight planning, ground-handling and flight operations, including performance, mass and balance, fuel schemes, selection of alternates, and ground de-icing/anti-icing;
- (iii) abnormal and emergency procedures, which include pilot incapacitation as applicable;
- (iv) a review of relevant samples of accidents/incidents and occurrences to increase awareness of the occurrences that may be relevant for the intended operation;

- (2) Emergency and safety equipment training

- (i) Emergency and safety equipment training may be combined with emergency and safety equipment checking and should be conducted in an aircraft or a suitable alternative training device.
- (ii) Every year the emergency and safety equipment training programme should include the following:
 - (A) actual donning of a life jacket, where fitted;

- (B) actual donning of protective breathing equipment, where fitted;
 - (C) actual handling of fire extinguishers of the type used;
 - (D) instruction on the location and use of all emergency and safety equipment carried on the aircraft; and
 - (E) instruction on the location and use of all types of exits.
- (3) Elements of CRM as specified in Table 1 of [AMC1 ORO.FC.115](#) should be integrated into all appropriate phases of recurrent training.
- (4) Aircraft/FSTD training
 - (i) The aircraft/FSTD training programme should be established in such a way that all the major failures of aircraft systems and associated procedures will have been covered in the preceding 3-year period.
 - (ii) When engine-out manoeuvres are carried out in an aircraft, the engine failure should be simulated.
 - (iii) When an FSTD is not available or accessible, the operator should establish mitigating measures to ensure that an adequate level of safety is maintained when conducting the training or checking in an aircraft. If one or more of the major failures cannot be practised in the aircraft because of their associated risks or because of environmental considerations, the failure(s) may be partially replicated for crew training purposes using pre-briefed, risk-assessed measures that avoid degrading the aircraft's performance below a predetermined level, and which permit immediate reversion to normal operating conditions.
- (b) Periodic check to demonstrate competence
 - (1) Each flight crew member should complete the periodic check as part of the normal crew complement.
 - (2) Periodic demonstrations of competence should be conducted every 12 months and may be combined with the proficiency check required by [Commission Regulation \(EU\) No 1178/2011](#).

[applicable from 26 March 2023]

GM1 ORO.FC.130 Recurrent training and checking

ED Decision 2022/014/R

PERIODIC CHECKS

- (a) For CAT operations, the operator proficiency checks and the line checks are both part of the periodic checks. For EBT operators, the EBT module and the line evaluations of competence are both part of the periodic checks.
- (b) For SPO operations, the operator proficiency checks are part of the periodic checks.
- (c) For non-CAT operations, the periodic checks may include a line check.

AMC1 ORO.FC.130(a) Recurrent training and checking

ED Decision 2022/014/R

OPERATIONS WITH VARIATIONS IN AIRCRAFT CONFIGURATION

[AMC1 ORO.FC.140\(a\)](#) should be used to determine the recurrent ground training and checking relevant to variations in aircraft configuration, if all of the following apply:

- (a) the pilot operates variations in aircraft configuration;
- (b) the aircraft operated do not all belong to the same group of types defined under [ORO.FC.140\(b\)](#); and
- (c) credit (as defined in point (a)(4) of [AMC1 ORO.FC.140\(a\)](#)) is sought.

ORO.FC.135 Pilot qualification to operate in either pilot's seat

Regulation (EU) No 965/2012

Flight crew members who may be assigned to operate in either pilot's seat shall complete appropriate training and checking as specified in the operations manual.

AMC1 ORO.FC.135 Pilot qualification to operate in either pilot's seat

ED Decision 2022/014/R

GENERAL

The training and checking for pilot qualification to operate in either pilot's seat should include any safety-critical items as specified in the operations manual where the action to be taken by the pilot is different depending on which seat they occupy.

NON-COMMERCIAL OPERATIONS WITH COMPLEX MOTOR-POWERED AIRCRAFT (NCC)

Training should be arranged so that all such items will have been covered in the preceding 3-year period.

[applicable from 26 March 2023]

ORO.FC.140 Operation on more than one type or variant

Regulation (EU) No 2021/2237

- (a) Flight crew members that operate more than one type or variant of aircraft shall comply with the requirements prescribed in this Subpart for each type or variant, unless credits related to the training, checking, and recent experience requirements are defined in the mandatory part of the operational suitability data established in accordance with [Regulation \(EU\) No 748/2012](#) for the relevant types or variants.
- (b) The operator may define groups of single-engined helicopter types. An operator proficiency check on one type shall be valid for all the other types within the group if both of the following conditions are met:
 - (1) the group either includes only single-engined turbine helicopters operated under VFR or it includes only single-engined piston helicopters operated under VFR;
 - (2) for CAT operations, at least two operator proficiency checks per type shall be conducted within a 3-year cycle.
- (c) For specialised operations, elements of the aircraft/FSTD training and operator proficiency check that cover the relevant aspects associated with the specialised task and are not related

to the type or group of types may be credited towards the other groups or types, based on a risk assessment performed by the operator.

- (d) For operations on more than one helicopter type or variant that are used for conducting sufficiently similar operations, if line checks rotate between types or variants, each line check shall revalidate the line check for the other helicopter types or variants.
- (e) Appropriate procedures and any operational restrictions shall be specified in the operations manual for any operation on more than one type or variant.

GM1 ORO.FC.140 Operation on more than one type or variant

ED Decision 2022/014/R

GENERAL

- (a) The concept of operating more than one type or variant depends on the experience, knowledge and ability of the operator and the flight crew concerned.
- (b) The first consideration is whether operations on one aircraft type or variant allow the safe operation of all other types and variants.
- (c) The second consideration is whether and how adequate training to address potential confusion and increased workload caused by the operation of several types or variants is achieved.

AMC1 ORO.FC.140(a) Operation on more than one type or variant

ED Decision 2022/014/R

GENERAL

- (a) Terminology

The terms used in the context of operation on more than one type or variant have the following meaning:

- (1) 'Base aircraft' refers to an aircraft used as a reference to compare differences with another aircraft.
- (2) 'Variant' refers to an aircraft or a group of aircraft within the same pilot type or class rating that has differences with the base aircraft and requires differences training or familiarisation.
- (3) A 'variation in aircraft configuration' refers to an aircraft or a group of aircraft within the same variant that has differences with the base aircraft and requires equipment and procedure training.
- (4) 'Credit' refers to the recognition of recurrent training, checking or recent experience based on commonalities between aircraft.
- (5) 'Operator difference requirements (ODRs)' refer to a formal description of differences between types or variants or aircraft configurations flown by a particular operator.
- (6) 'Training' refers to differences training, familiarisation and equipment training.
- (7) 'Currency' refers to the recurrent training on types and variants.

- (b) Scope of ODRs

The operator should use the ODRs methodology, a means of evaluating aircraft differences and similarities, in order to define the training and checking in the following cases:

- (1) for the introduction of a change of equipment on a type or variant currently operated;
 - (2) for the introduction of a new variant within a type or class currently operated;
 - (3) for the recurrent training and checking of variations in aircraft configuration. The operator may define credit based on ODRs tables;
 - (4) for the operation of more than one type or variant when credit is sought, in which case all of the following should apply:
 - (i) All training, checking and currency requirements should be completed independently for each type or variant unless credits have been established by using ODRs tables.
 - (ii) All recent experience requirements should be completed independently for each type unless credits have been established by using ODRs tables.
 - (iii) The operator may define credit based on ODRs tables that should not be less restrictive than the OSD.
- (c) ODRs methodology
- (1) The operator should conduct a detailed evaluation of the differences or similarities of the aircraft concerned in order to establish appropriate procedures or operational restrictions. This evaluation should be based on the OSD for the relevant types or variants and should be adapted to the operator's specific variations in aircraft configuration. This evaluation should take into account all of the following:
 - (i) the level of technology;
 - (ii) operational procedures; and
 - (iii) handling characteristics.
 - (2) ODRs tables

The operator should first nominate one aircraft as the base aircraft from which to show differences with the second aircraft type or variant or variation in aircraft configuration, the 'difference aircraft', in terms of technology (systems), procedures, pilot handling and aircraft management. These differences, known as ODRs, preferably presented in tabular format, constitute part of the justification for operating more than one type or variant and also the basis for the associated differences/familiarisation or reduced type rating training for the flight crew.
 - (3) The ODRs tables should be presented as follows:

GENERAL OPERATOR DIFFERENCE REQUIREMENTS TABLE										
DIFFERENCE AIRCRAFT: BASE AIRCRAFT:				COMPLIANCE METHOD						
				TRAINING					CHECKING/ CURRENCY	
General	Differences	Flt char	Proc chg	A	B	C	D	E	FLT CHK	CURR ENCY
GENERAL	Range ETOPS certified	No	Yes		CBT					
DIMENSIONS	Configuration per AFM, FCOM	Yes	No		CBT					

SYSTEM OPERATOR DIFFERENCE REQUIREMENTS TABLE										
DIFFERENCE AIRCRAFT: BASE AIRCRAFT:				COMPLIANCE METHOD						
				TRAINING					CHECKING/ CURRENCY	
System	Differences	Flt char	Proc chg	A	B	C	D	E	FLT CHK	CURR ENCY
21 – AIR CONDITIONING	CONTROLS AND INDICATORS: - Panel layout	No	Yes	HO						
21 – AIR CONDITIONING	PACKS: - Switch type - Automatically controlled - Reset switch for both packs	No	Yes		CBT					

MANOEUVRE OPERATOR DIFFERENCE REQUIREMENTS TABLE										
DIFFERENCE AIRCRAFT: BASE AIRCRAFT:				COMPLIANCE METHOD						
				TRAINING					CHECKING/ CURRENCY	
Manoeuvre	Differences	Flt char	Proc chg	A	B	C	D	E	FLT CHK	CURR ENCY
Exterior Preflight	Minor differences	No	No	HO						
Preflight	Differences due to systems, ECL	No	Yes		CBT	FTD				
Normal take-off	FBW handling v conventional; AFDS TAKE-OFF: Autothrottle engagement FMA indications	No	Yes		CBT			FFS		

(4) Compilation of ODRs tables

(i) ODRs 1: General

The general characteristics of the candidate aircraft are compared with the base aircraft with regard to:

- (A) general dimensions and aircraft design (number and type of rotors, wing span or category);
 - (B) flight deck general design;
 - (C) cabin layout;
 - (D) engines (number, type and position);
 - (E) limitations (flight envelope).
- (ii) ODRs 2: Systems
- Consideration is given to differences in design between the candidate aircraft and the base aircraft. For this comparison, the Air Transport Association (ATA) 100 index is used. This index establishes a system and subsystem classification and then an analysis is performed for each index item with respect to the main architectural, functional and operations elements, including controls and indications on the systems control panel.
- (iii) ODRs 3: Manoeuvres
- Operational differences encompass normal, abnormal and emergency situations and include any change in aircraft handling and flight management. It is necessary to establish a list of operational items for consideration on which an analysis of differences can be made.
- The operational analysis should take the following into account:
- (A) flight deck dimensions (size, cut-off angle and pilot eye height);
 - (B) differences in controls (design, shape, location and function);
 - (C) additional or altered function (flight controls) in normal or abnormal conditions;
 - (D) handling qualities (including inertia) in normal and in abnormal configurations;
 - (E) aircraft performance in specific manoeuvres;
 - (F) aircraft status following failure;
 - (G) management (e.g. ECAM, EICAS, navaid selection, automatic checklists).
- (iv) Once the differences for ODRs 1, ODRs 2 and ODRs 3 have been established, the consequences of differences evaluated in terms of flight characteristics (FLT CHAR) and change of procedures (PROC CHNG) should be entered into the appropriate columns.
- (v) Difference levels — crew training, checking and currency
- (A) In order to operate more than one type or variant, the operator should establish crew training, checking and currency requirements. This may be done by applying the coded difference levels from the table in point (d)(2) to the compliance method column of the ODRs tables.
 - (B) Differences identified in the ODRs tables as impacting flight characteristics or procedures, should be analysed in the corresponding ATA section of the ODRs manoeuvres. Normal, abnormal and emergency situations should be addressed accordingly.

(d) Difference levels

(1) Difference levels — general

Difference levels are used to identify the extent of a difference between a base and a candidate aircraft with reference to the elements described in the ODRs tables. These levels are proportionate to the differences between a base and a candidate aircraft. A range of five difference levels in order of increasing requirements, identified as A through E, are each specified for training, checking, and currency.

Difference levels apply when a difference with the potential to affect flight safety exists between a base and a candidate aircraft. Differences may also affect the knowledge, skills, or abilities required from a pilot. If no differences exist, or if differences exist but do not affect flight safety, or if differences exist but do not affect knowledge, skills or abilities, then difference levels are neither assigned nor applicable to pilot qualification. When difference levels apply, each level is based on a scale of differences related to design features, systems, or manoeuvres. In assessing the effects of differences, both flight characteristics and procedures are considered since flight characteristics address handling qualities and performance, while procedures include normal, non-normal and emergency items.

Levels for training, checking, and currency are assigned independently, but are linked depending on the differences between a base and candidate aircraft. Training at level E usually identifies that the candidate aircraft is a different type from the base aircraft.

(2) Difference levels are summarised in the table below regarding training, checking, and currency.

DIFFERENCE LEVEL	TRAINING	CHECKING	CURRENCY
A	Self-instruction	Not applicable or integrated with next proficiency check	Not applicable
B	Aided instruction	Task or system check	Self-review
C	System devices	Partial proficiency check using qualified device	Designated system
D	Manoeuvre training devices ¹ or aircraft to accomplish specific manoeuvres	Partial proficiency check using qualified device ¹	Designated manoeuvre(s) ¹
E	FSTDs ² or aircraft	Proficiency check using FSTDs ² or aircraft	As per regulation, using FSTDs ² or aircraft

Footnote (1):

- Aeroplane: FTD level 2, or FFS, or aeroplane
- Helicopter: FTD levels 2 and 3, or FFS, or helicopter

Footnote (2):

- Aeroplane: FFS level C or D, or aeroplane
- Helicopter: FSTDs having dual qualification: FFS level B and FTD level 3, or FFS level C or D, or helicopter

Training levels A and B require knowledge, levels C and D require additional skills. Training level E means that the differences are such that type rating training is required or, in the context of equipment and procedure training, aircraft/FSTD training and checking is required.

(3) Difference levels — training

The training difference levels specified represent the minimum requirements. Devices associated with a higher difference level may be used to satisfy a training differences requirement.

(i) Level A training

Level A differences training is applicable to aircraft with differences that can adequately be addressed through self-instruction. Level A training represents a knowledge requirement such that once appropriate information is provided, understanding and compliance can be assumed to be demonstrated.

Training needs not covered by level A training may require level B training or higher, depending on the outcome of the evaluations described in the aircraft evaluation process (CS FCD.420).

(ii) Level B training

Level B differences training is applicable to aircraft with system or procedure differences that can adequately be addressed through aided instruction.

At level B aided instruction, it is appropriate to ensure pilot understanding, emphasise issues, provide a standardised method of presentation of material, or to aid retention of material following training.

(iii) Level C training

Level C differences training can only be accomplished through the use of devices capable of systems training.

Level C differences training is applicable to variants having ‘part task’ differences that affect skills or abilities as well as knowledge. Training objectives focus on mastering individual systems, procedures, or tasks, as opposed to performing highly integrated flight operations and manoeuvres in ‘real time’. Level C may also require self-instruction or aided instruction of a pilot, but cannot be adequately addressed by a knowledge requirement alone. Training devices are required to supplement instruction to ensure attainment or retention of pilot skills and abilities to accomplish the more complex tasks, usually related to operation of particular aircraft systems.

The minimum acceptable training media for level C are interactive computer-based training, cockpit systems simulators, cockpit procedure trainers, part task trainers (such as inertial navigation system (INS), flight management system (FMS), or traffic collision avoidance system (TCAS) trainers), or similar devices.

(iv) Level D training

Level D differences training can only be accomplished with devices capable of performing flight manoeuvres and addressing full task differences affecting knowledge, skills, or abilities.

Devices capable of flight manoeuvres address full task performance in a dynamic 'real time' environment and enable integration of knowledge, skills and abilities in a simulated flight environment, involving combinations of operationally oriented tasks and realistic task loading for each relevant phase of flight. At level D, knowledge and skills to complete necessary normal, non-normal and emergency procedures are fully addressed for each variant.

Level D differences training requires mastery of interrelated skills that cannot be adequately addressed by separate acquisition of a series of knowledge areas or skills that are interrelated. However, the differences are not so significant that a full type rating training course is required. If demonstration of interrelationships between the systems was important, the use of a series of separate devices for systems training would not suffice. Training for level D differences requires a training device that has accurate, high-fidelity integration of systems and controls and realistic instrument indications. Level D training may also require manoeuvre visual cues, motion cues, dynamics, control loading or specific environmental conditions. Weather phenomena such as low-visibility conditions or wind shear may or may not be incorporated. Where simplified or generic characteristics of an aircraft type are used in devices to satisfy level D differences training, significant negative training should not occur as a result of the simplification.

Appropriate devices as described in CS FCD.415(a), satisfying level D differences training range from those where relevant elements of aircraft flight manoeuvring, performance, and handling qualities are incorporated. The use of a manoeuvre training device or aircraft is limited for the conduct of specific manoeuvres or handling differences, or for specific equipment or procedures.

(v) Level E training

Level E differences training is applicable to candidate aircraft that have such significant 'full task' differences that a full type rating training course or a type rating training course with credit for previous experience on similar aircraft types is required to meet the training objectives.

The training requires a 'high-fidelity' environment to attain or maintain knowledge, skills, or abilities that can only be satisfied by the use of FSTDs or the aircraft itself as mentioned in CS FCD.415(a). Level E training, if done in an aircraft, should be modified for safety reasons where manoeuvres can result in a high degree of risk.

When level E differences training is assigned, suitable credit or constraints may be applied for knowledge, skills or abilities related to other pertinent aircraft types. The training programme should specify the relevant subjects, procedures or manoeuvres.

(4) Difference levels — checking

Differences checking addresses any pertinent pilot testing or checking. Initial and recurrent checking levels are the same unless otherwise specified.

It may be possible to satisfactorily accomplish recurrent checking objectives in devices that do not meet the initial checking requirements. In such instances, the applicant may propose for revalidation checks the use of certain devices that do not meet the initial checking requirements.

- (i) Level A checking

Level A differences checking indicates that no check related to differences is required at the time of differences training. However, a pilot is responsible for knowledge of each variant flown.
 - (ii) Level B checking

Level B differences checking indicates that a 'task' or 'systems' check is required following initial and recurring training.
 - (iii) Level C checking

Level C differences checking requires a partial check using a suitable qualified device. A partial check is conducted relative to particular manoeuvres or systems.
 - (iv) Level D checking

Level D differences checking indicates that a partial proficiency check is required following both initial and recurrent training. In conducting the partial proficiency check, manoeuvres common to each variant may be credited and need not be repeated. The partial proficiency check covers the specified particular manoeuvres, systems or devices. Level D checking is performed using scenarios that represent a 'real-time' flight environment and uses qualified devices permitted for level D training or higher.
 - (v) Level E checking

Level E differences checking requires that a full proficiency check be conducted in FSTDs or in an aircraft as mentioned in CS FCD.415(a), following both initial and recurrent training. If appropriate, alternating Level E checking between relevant aircraft is possible and credit may be defined for procedures or manoeuvres based on commonality.

Assignment of level E checking requirements alone, or in conjunction with level E currency, does not necessarily result in assignment of a separate type rating.
- (5) Difference levels — currency
- Differences currency addresses any currency and re-currency levels. Initial and recurrent currency levels are the same unless otherwise specified.
- (i) Level A currency

Level A currency is common to each aircraft and does not require separate tracking. Maintenance of currency in any aircraft suffices for any other variant within the same type rating.
 - (ii) Level B currency

Level B currency is 'knowledge-related' currency, typically achieved through self-review by individual pilots.
 - (iii) Level C currency
 - (A) Level C currency is applicable to one or more designated systems or procedures and it relates to both skill and knowledge requirements. When level C currency applies, any pertinent lower-level currency is also to be addressed.
 - (B) Re-establishing level C currency

When currency is lost, it may be re-established by completing required items using a device equal to or higher than that specified for level C training and checking.

(iv) Level D currency

- (A) Level D currency is related to designated manoeuvres and addresses knowledge and skills required for performing aircraft control tasks in real time with integrated use of associated systems and procedures. Level D currency may also address certain differences in flight characteristics including performance of any required manoeuvres and related normal, non-normal and emergency procedures. When level D is necessary, any pertinent lower-level currency is also to be addressed.

(B) Re-establishing level D currency

When currency is lost, currency may be re-established by completing pertinent manoeuvres using a device equal to or higher than that specified for level D differences training and checking.

(v) Level E currency

- (A) Level E currency requires that recent experience requirements of Part-FCL and operational requirements be complied with in each aircraft separately. Level E currency may also specify other system, procedure, or manoeuvre currency item(s) necessary for safe operations and may require procedures or manoeuvres to be accomplished in FSTDs or in an aircraft as mentioned in CS FCD.415(a). Provisions are applied in a way which addresses the required system or manoeuvre experience.

When level E is assigned between aircraft of common characteristics, credit may be permitted. Assignment of level E currency requirements does not automatically lead to a determination on same or separate type rating. Level E currency is tracked by a means that is acceptable to the competent authority.

When common take-off and landing credit (CTL) is permitted, any credit or constraints applicable to using FSTDs, as mentioned in CS FCD.415(a), are also to be determined.

(B) Re-establishing level E currency

When currency is lost, currency may be re-established by completing pertinent manoeuvres using a device specified for level E differences training and checking.

(6) Competency regarding non-normal and emergency procedures — currency

Competency for non-normal and emergency manoeuvres or procedures is generally addressed by checking requirements. Particular non-normal and emergency manoeuvres or procedures may not be considered mandatory for checking or training. In this situation, it may be necessary to periodically practise or demonstrate those manoeuvres or procedures specifying currency requirements for those manoeuvres or procedures.

GM1 ORO.FC.140(a) Operation on more than one type or variant

ED Decision 2022/014/R

OPERATOR DIFFERENCE REQUIREMENTS (ODRS)

The ODRs tables may result in different training programmes, depending on the training needs, regardless of the 'base aircraft' used to establish the table (e.g. the trainee may know the 'other aircraft' and be trained towards the 'base aircraft').

AMC1 ORO.FC.140(b) Operation on more than one type or variant

ED Decision 2022/014/R

GROUPS OF SINGLE-ENGINEED PISTON HELICOPTER TYPES FOR THE REVALIDATION OF THE OPC

When establishing groups of single-engined helicopter types for the purpose of crediting of proficiency checks, the operator should only take into account the helicopter types considered for crediting in AMC1 FCL.740.H(a)(3).

AMC1 ORO.FC.140(d) Operation on more than one type or variant

ED Decision 2022/014/R

LINE CHECKS — HELICOPTERS

- (a) Prior to using a line check on one helicopter type or variant to revalidate the line check on other helicopter types or variants, the operator should consider whether the type of operations are sufficiently similar in terms of:
 - (1) use of aerodromes or operating sites;
 - (2) day VFR or night VFR;
 - (3) use of operational approvals and specific approvals;
 - (4) normal procedures, including flight preparation, take-off and landing procedures; and
 - (5) use of automation.
- (b) For IFR operations of helicopters, an operation should only be considered sufficiently similar to allow a line check on one type or variant to revalidate the line check for the other type or variant if such credits are defined in the operational suitability data established in accordance with [Commission Regulation \(EU\) No 748/2012](#)¹, as determined in point (a) of [ORO.FC.140](#).
- (c) Line check cross-crediting should be defined in the operations manual.

ORO.FC.145 Provision of training, checking and assessment

Regulation (EU) 2021/2237

- (a) All training, checking and assessment required in this Subpart shall be conducted in accordance with the training programmes and syllabi established by the operator in the operations manual;
- (b) When establishing the training programmes and syllabi, the operator shall include the relevant elements defined in the mandatory part of the operational suitability data established in accordance with [Regulation \(EU\) No 748/2012](#).

¹ OJ L 243, 27.9.2003, p. 6.

- (c) In the case of CAT operations, training and checking programmes, including syllabi and the use of the means to deliver the programme such as individual flight simulation training devices (FSTDs) and other training solutions, shall be approved by the competent authority.
- (d) The FSTD used to meet the requirements of this Subpart shall be qualified in accordance with [Regulation \(EU\) No 1178/2011](#) and it shall replicate the aircraft used by the operator, as far as practicable. Differences between the FSTD and the aircraft shall be described and addressed through a briefing or training, as appropriate.
- (e) The operator shall establish a system to adequately monitor changes to the FSTD and to ensure that those changes do not affect the adequacy of the training programmes.
- (f) The operator shall monitor the validity of each recurrent training and checking.
- (g) The validity periods required in this Subpart shall be counted from the end of the month in which the recency, training or check was completed.

AMC1 ORO.FC.145 Provision of training, checking and assessment

ED Decision 2022/014/R

ACCEPTANCE OF PREVIOUS TRAINING FOR NON-COMMERCIAL OPERATIONS WITH COMPLEX MOTOR-POWERED AIRCRAFT, INCLUDING NON-COMMERCIAL SPECIALISED OPERATIONS

- (a) If the operator chooses to make use of previous training received by the pilot, the operator should develop a policy for the crediting of such training. Details of such policy should be included in the operations manual.
- (b) The policy should as a minimum include measures to assess:
 - (1) the content of the previous training;
 - (2) whether the previous training was delivered by suitably qualified personnel or organisations;
 - (3) whether the aircraft, FSTD or other equipment used for the previous training was sufficiently similar to the aircraft and equipment the crew member will operate; and
 - (4) whether the operating procedures used during such previous training were sufficiently representative of the procedures used by the new operator.
- (c) Where previous training delivered by other suitably qualified personnel or organisations is found to satisfy all or some of the requirements in [ORO.FC.120](#), the training may be credited and an abbreviated conversion course may be used. Such an abbreviated course should cover all items not credited from previous training.
- (d) Where a pilot flies for more than one operator and the training delivered by that other operator is found to satisfy some of the requirements of [ORO.FC.130](#), then such training may be credited and an abbreviated recurrent training programme may be used. Such an abbreviated recurrent training programme should cover all items not credited from the training delivered by the other operator.
- (e) An aircraft operator remains responsible for all training required by this Part regardless of whether the training is conducted by the operator, another operator, a certified organisation or another subcontractor, as defined in [ORO.GEN.205](#).
- (f) An operator accepting any previous training should be satisfied that the flight crew member is competent to operate in accordance with that operator's procedures and to use the specific equipment installed on the aircraft to be operated.

- (g) Previous training needs to be formally documented.
- (h) The assessment under (b) and the documents referred to under (g) should be stored as part of the crew member training, checking and qualifications records.

GM1 ORO.FC.145 Provision of training, checking and assessment

ED Decision 2022/014/R

POLICY FOR ACCEPTANCE OF PREVIOUS TRAINING AND CHECKING FOR OTHER THAN COMMERCIAL AIR TRANSPORT OPERATIONS (NCC)

If the operator chooses to make use of previous training received by the pilot, in accordance with [AMC1 ORO.FC.145](#), the operator may wish to enter into arrangements with other operators in order to satisfy the requirements of [ORO.GEN.205](#) in relation to contracted training providers or other aircraft operators.

AMC1 ORO.FC.145(a) Provision of training, checking and assessment

ED Decision 2022/014/R

TRAINING AND CHECKING PROGRAMMES AND SYLLABI

- (a) Training and checking programmes and syllabi should include as a minimum:
 - (1) when training and checking take place during the same session, the distinction between the two;
 - (2) a list of the items covered;
 - (3) the minimum time allocation (duration);
 - (4) the means of delivery (e.g. FSTD, OTD, computer-based, VR, etc.);
 - (5) the personnel providing the training and conducting the checks.
- (b) Further details on the training and checking programmes and syllabi should be included in the operations manual depending on the complexity of the operations (e.g. further contextualisation of the training programme, details of the airport in which some items will be covered, time allocation to brief and debrief, whether the item to be trained is a legal requirement or an SMS item, etc.).

[applicable from 26 March 2023]

GM1 ORO.FC.145(a) Provision of training, checking and assessment

ED Decision 2022/014/R

TRAINING AND CHECKING PROGRAMMES AND SYLLABI

The syllabus lists the topics to be covered in a training and checking programme. A syllabus may include:

- the personnel providing the training and conducting the checks;
- a description of the content;
- the means of delivery (e.g. FSTD, aircraft, OTD, (virtual) classroom, computer-based training, VR, etc.);
- the minimum time allocation (duration);
- the prerequisites to be fulfilled before starting the training or checking;

- the standard of performance;
- the training objectives;
- a reference to training/checking material;
- the checking requirements, if any;
- when training and checking is combined, the distinction between trained and checked items.

[applicable from 26 March 2023]

AMC1 ORO.FC.145(b) Provision of training, checking and assessment

ED Decision 2022/014/R

NON-MANDATORY (RECOMMENDATION) ELEMENTS OF OPERATIONAL SUITABILITY DATA

When developing the training programmes and syllabi, the operator should include the non-mandatory (recommendation) elements for the relevant type that are provided in the operational suitability data established in accordance with [Commission Regulation \(EU\) No 748/2012](#).

AMC1 ORO.FC.145(d) Provision of training, checking and assessment

ED Decision 2022/014/R

FULL FLIGHT SIMULATORS (FFS)

The operator should classify any differences between the aircraft and FFS in accordance with the Air Transport Association (ATA) chapters as follows:

Compliance Levels

(a) Level A differences:

- (1) no influence on flight characteristics;
- (2) no influence on procedures (normal and/or abnormal);
- (3) differences in presentation; and
- (4) differences in operation.

Method: self-instruction via the operations manual or flight crew information.

(b) Level B differences:

- (1) no influence on flight characteristics;
- (2) influence on procedures (normal and/or abnormal); and
- (3) possible differences in presentation and operation.

Method: flight crew information, computer-based training, system device training or special instruction by instructor.

(c) Level C differences:

- (1) influence on flight characteristics;
- (2) influence on procedures (normal and/or abnormal); and
- (3) eventually differences in presentation and operation.

Method: special instruction by instructor, a selected partial training on another FSTD or aircraft or a waiver because of previous experience, special instruction or training programme.

(d) Level D differences:

- (1) influence on flight characteristics; and/or
- (2) influence on procedures (normal and/or abnormal); and/or
- (3) differences in presentation and/or operation; and
- (4) FSTD is level D qualified and is used for zero flight-time training (ZFTT).

Method: a specified partial training on another FSTD or aircraft or a waiver because of previous experience, special instruction or training programme.

AMC2 ORO.FC.145(d) Provision of training, checking and assessment*ED Decision 2022/014/R***FSTDs**

- (a) Before the operator extracts the data from an FSTD that can be related to a pilot, it should develop a data access and security policy.
- (b) 'Availability' and 'accessibility' of FSTD used in this Subpart.
 - (1) 'Available FSTD' refers to any flight simulation training device (FSTD) that is vacant for use by the FSTD operator or by the customers irrespective of any time consideration.
 - (2) 'Accessible' refers to a device that can be used by the operator to conduct training or checking pertaining to this Subpart, and by the nominated person conducting the training or checking.

More information on these definitions can be found in Part-FCL of [Regulation \(EU\) No 1178/2011](#).

[applicable from 26 March 2023]

GM1 ORO.FC.145(d) Provision of training, checking and assessment*ED Decision 2022/014/R***CONFIDENTIALITY AND PROTECTION OF TRAINING DATA IN COMMERCIAL AIR TRANSPORT**

- (a) Without prejudice to applicable national legislation on the protection of individuals with regard to the processing of personal data, for the training conducted in accordance with [ORO.FC.145](#) the operator may have a training data access and security policy (including the procedure to prevent disclosure of crew identity).
- (b) If the operator decides to have such a policy, it should:
 - (1) be agreed by all parties involved (airline management and flight crew member representatives nominated either by the union or the flight crew themselves);
 - (2) be in line with the organisation's safety policy in order to not make available or to not make use of the training data to attribute blame or liability.
- (c) The training data access and security policy may include a policy for access to information only to specifically authorised persons identified by their position in order to perform their duties.

[applicable from 26 March 2023]

AMC1 ORO.FC.145(g) Provision of training, checking and assessment

ED Decision 2022/014/R

VALIDITY PERIOD OF RECURRENT ASSESSMENT, TRAINING AND CHECKING

- (a) When the recency, training or check is completed within the last 3 months of the validity period, the new validity period should be counted from the original expiry date.
- (b) When the recency, training or check is completed before the last 3 months of the validity period, the new validity period should be counted from the end of the month when the recency, training or check was completed and not from the original expiry date.
- (c) Notwithstanding (a), the revalidation of CRM instructor and EBT instructor qualifications should follow [AMC2 ORO.FC.146](#) and [AMC2 ORO.FC.146\(c\)](#).

ORO.FC.146 Personnel providing training, checking and assessment

Regulation (EU) 2021/2237

- (a) All training, checking and assessment required in this Subpart shall be conducted by appropriately qualified personnel.
- (b) In the case of flight and flight simulation training, checking and assessment, the personnel that provide the training and conduct the checking or assessment shall be qualified in accordance with Annex I (Part- FCL) to [Regulation \(EU\) No 1178/2011](#). Additionally, the personnel providing training and conducting checking towards specialised operations shall be suitably qualified for the relevant operation.
- (c) For an EBT programme, the personnel that performs assessment and provides training shall:
 - (1) hold an Annex I (Part-FCL) instructor or examiner certificate;
 - (2) complete the operator's EBT instructor standardisation programme. This shall include an initial standardisation programme and a recurrent standardisation programme.
Completion of the operator's EBT initial standardisation will qualify the instructor to perform EBT practical assessment.
- (d) Notwithstanding point (b), the line evaluation of competence may be conducted by a suitably qualified commander nominated by the operator that is standardised in EBT concepts and the assessment of competencies (line evaluator).
- (e) Notwithstanding point (b), the aircraft/FSTD training and the operator proficiency check may be conducted by a suitably qualified commander holding a FI/TRI/SFI certificate and nominated by the operator for any of the following operations:
 - (1) CAT operations of helicopters meeting the criteria defined in point [ORO.FC.005\(b\)\(2\)](#);
 - (2) CAT operations of other than complex motor-powered helicopters by day and over routes navigated by reference to visual landmarks;
 - (3) CAT operations of performance class B aeroplanes that do not meet the criteria defined in point [ORO.FC.005\(b\)\(1\)](#).
- (f) Notwithstanding point (b), the aircraft/FSTD training and the demonstration of competence/operator proficiency check may be conducted by a suitably qualified pilot-in-command/commander nominated by the operator for any of the following operations:
 - (1) specialised operations;
 - (2) CAT operations of aeroplanes meeting the criteria defined in point [ORO.FC.005\(b\)\(2\)](#).

- (g) Notwithstanding point (b), the line check may be conducted by a suitably qualified commander nominated by the operator.
- (h) The operator shall inform the competent authority about the persons nominated under points (e) to (g).

AMC1 ORO.FC.146 Personnel providing training, checking and assessment

ED Decision 2022/014/R

PERSONNEL CONDUCTING TRAINING AND CHECKING — GENERAL

Training and checking should be provided by the following personnel:

- (a) Ground and refresher training by suitably qualified personnel;
- (b) Emergency and safety equipment training and checking by suitably qualified personnel as specified in the operator's manual;
- (c) CRM
 - (1) Integration of CRM elements into the different phases of training by all the personnel conducting the training, as per [AMC1](#) and [AMC2 ORO.FC.115](#).
 - (2) The operator should ensure that all personnel conducting such training are suitably qualified to integrate elements of CRM into this training.
 - (3) Classroom CRM training by at least one CRM trainer, qualified as specified in [AMC2 ORO.FC.146](#) who may be assisted by experts in order to address specific areas.

AMC2 ORO.FC.146 Personnel providing training, checking and assessment

ED Decision 2022/014/R

FLIGHT CREW CRM TRAINER

- (a) Applicability

The provisions described herein:

- (1) should be fulfilled by flight crew CRM trainers responsible for classroom CRM training; and
- (2) are not applicable to:
 - (i) instructors, holding a certificate in accordance with [Commission Regulation \(EU\) No 1178/2011](#), when conducting CRM training in the operational environment; and
 - (ii) trainers or instructors when conducting training other than CRM training, but integrating CRM elements into this training.
- (b) Qualification of a flight crew CRM trainer
 - (1) Prerequisites. A flight crew CRM trainer should:
 - (i) have adequate knowledge of human performance and limitations (HPL), whilst:
 - (A) having obtained a commercial pilot licence in accordance with [Commission Regulation \(EU\) No 1178/2011](#); or

- (B) having followed a theoretical HPL course covering the whole syllabus of the HPL examination;
 - (ii) have completed flight crew initial operator's CRM training;
 - (iii) have received training in group facilitation skills, except for instructors holding a certificate in accordance with [Commission Regulation \(EU\) No 1178/2011](#).
- (2) In order to qualify as flight crew CRM trainer, a person meeting the prerequisites should:
 - (i) have adequate knowledge of the relevant flight operations at one operator, in accordance with (d);
 - (ii) receive the initial training in accordance with (c)(3); and
 - (iii) be assessed by that operator in accordance with (f).
- (3) In order to act as flight crew CRM trainer at an operator, a qualified and current flight crew CRM trainer should meet one of the following conditions:
 - (i) have adequate knowledge of the relevant flight operations at that operator, in accordance with (d); or
 - (ii) be part of a team of trainers in accordance with (e).
- (4) The period of validity of the flight crew CRM trainer qualification should be 3 years.
- (5) Recency and renewal of the flight crew CRM trainer qualification
 - (i) The flight crew CRM trainer should complete CRM trainer refresher training within the last 12 months of the 3-year validity period; and
 - (ii) The flight crew CRM trainer should meet one or both of the following conditions:
 - (A) conduct at least 3 CRM training events within the 3-year validity period;
 - (B) be assessed within the last 12 months of the 3-year validity period in accordance with (f); and
 - (iii) If the flight crew CRM trainer qualification has expired, it can be renewed if all of the conditions below are met. The validity should be 3 years after completion of (A) and (C) below, whichever comes first:
 - (A) complete CRM trainer refresher training;
 - (B) receive refresher training on knowledge of the relevant flight operations, as necessary;
 - (C) be assessed in accordance with (f).
- (c) Training of flight crew CRM trainer
 - (1) If the operator trains flight crew CRM trainers, the training syllabi should be described in the operations manual. The operator should ensure that the initial and refresher training of the flight crew CRM trainers are conducted by flight crew CRM trainers with a minimum of 3 years of experience.
 - (2) Training of flight crew CRM trainers should be both theoretical and practical. Practical elements should include the development of specific trainer skills, particularly the integration of CRM into line operations.

- (3) The initial training of flight crew CRM trainers should include the following:
- (i) introduction to CRM training and competencies for CRM trainers:
 - (A) ability to interact with and manage a group;
 - (B) ability to pre-plan an objective and timely training session;
 - (C) ability to deliver a good balance of ‘telling’, ‘selling’ and ‘facilitating’;
 - (D) ability to connect realistically poor and good CRM to the operations;
 - (E) ability to assess the performance, the progress and needs of trainees in a meaningfully way;
 - (ii) operator’s management system as defined in point (a)(7) of [AMC1 ORO.FC.115](#); and
 - (iii) characteristics of the flight crew CRM training as defined in Table 1 of [AMC1 ORO.FC.115](#) and its integration into line operations:
 - (A) the different types of CRM trainings (initial, recurrent, etc.);
 - (B) combined training; and
 - (C) training related to the type of aircraft or operation.

Instructors holding a certificate in accordance with [Commission Regulation \(EU\) No 1178/2011](#) may be credited towards (i) and (ii) if they have completed the refresher training defined in (4).

- (4) The refresher training of flight crew CRM trainers should include new methodologies, procedures and lessons learned, as well as additional topics such as the following:
- (i) Group facilitation skills including team dynamics, moderation skills and use of questions
 - (ii) Course preparation, defining objectives and selecting methods to best convey knowledge (e.g. lecture, group work, case analysis, gamification, scenario-based training, individual research)
 - (iii) Safety culture and management systems
 - (iv) An example of an analysis of CRM factors in an accident or serious incident.
 - (v) New developments or research in human factors and CRM
 - (vi) TEM principles and their practical implementation in normal operations
- (5) Instructors, holding a certificate in accordance with [Commission Regulation \(EU\) No 1178/2011](#), who are also CRM trainers, may combine the CRM trainer refresher training with instructor refresher training if the instructor refresher training meets all of the conditions defined in (4).
- (6) Instructors for other-than complex motor-powered aeroplanes should be qualified as flight crew CRM trainers for this aircraft category with no additional training, as specified in (3) and (4) when:
- (i) holding a certificate in accordance with [Commission Regulation \(EU\) No 1178/2011](#); and
 - (ii) fulfilling the provisions of (b)(2) or (b)(5).

- (d) Knowledge of the relevant flight operations
- (1) The operator should evaluate the experience and knowledge of the flight crew CRM trainer. The evaluation of the operator should include at least:
 - (i) the operational experience of the flight crew CRM trainer as a flight crew member;
 - (ii) whether this experience as a flight crew member or a former flight crew member covers the aircraft category, the aircraft generation and the form of operations, as relevant to the operator.
 - (2) If the flight crew CRM trainer does not have the relevant knowledge of the relevant flight operation based on the evaluation in (1), the operator should provide training to the flight crew CRM trainer to provide the adequate knowledge.
 - (3) The operator should describe the assessment and training in the operations manual.
- (e) Team of CRM trainers
- If the flight crew CRM trainer is qualified in accordance with (b) but does not meet the conditions defined in (d), he or she may be assisted by a training assistant that has the knowledge of the relevant flight operations. The operator should ensure that all the following conditions are met:
- (1) The training assistant should meet the condition defined in (c) but needs not meet the conditions defined in (b). The training assistant should be an instructor or have experience in ground training.
 - (2) The flight crew CRM trainer and the training assistant should prepare the training session together and adapt it to the operational needs of the operator.
 - (3) If the flight crew CRM trainer and the training assistant have already provided training for the operator or for a similar operator, the operator may determine that condition (2) is met.
 - (4) The flight crew CRM trainer and the training assistant should provide the training together.
 - (5) The flight crew CRM trainer remains responsible for the training.
- (f) Assessment of a flight crew CRM trainer
- (1) The operator should ensure that the process for the assessment is included in the operations manual describing methods for observing, recording, interpreting and debriefing the flight crew CRM trainer. All personnel involved in the assessment must be credible and competent in their role.
 - (2) The assessment should enable the flight crew CRM trainer to demonstrate the knowledge and ability to train the CRM training elements in the non-operational environment. Special attention should be given to fields such as group management, group dynamics and personal awareness.
 - (3) The initial assessment of a flight crew CRM trainer by the operator may take place when conducting their first CRM training course.
 - (4) The assessment of flight crew CRM trainers should be conducted by flight crew CRM trainers with a minimum of 3 years of experience.
- (g) The operator should only select a qualified and current flight crew CRM trainer meeting the conditions defined in (d) or (e).

[applicable from 26 March 2023]

AMC1 ORO.FC.146(b) Personnel providing training, checking and assessment

ED Decision 2022/014/R

PERSONNEL PROVIDING AIRCRAFT/FSTD TRAINING AND CONDUCTING OPERATOR PROFICIENCY CHECKING AND QUALIFIED UNDER ANNEX I (PART-FCL) TO REGULATION (EU) No 1178/2011

Training and checking should be provided by the following personnel:

- (a) Flight training by a type rating instructor (TRI) or class rating instructor (CRI), flight instructor (FI) or, in the case of the FSTD content, a synthetic flight instructor (SFI). For commercial air transport, the FI, TRI, CRI or SFI should satisfy the operator's experience and knowledge requirements sufficiently to instruct on aircraft systems and operational procedures and requirements.
- (b) Operator proficiency check by a type rating examiner (TRE), class rating examiner (CRE) or, if the check is conducted in an FSTD, a synthetic flight examiner (SFE). The TRE, CRE or SFE should be trained in CRM concepts and the assessment of CRM skills.
- (c) For aircraft/FSTD training, line flying under supervision, operator proficiency checks and line checks, if the training or checking includes multi-pilot operations in helicopters, in addition to (a) and (b) the personnel conducting training or checking should have 350 hours flying experience in multi-pilot operations.
- (d) In the case of CAT operations in helicopters, the 350 hours flying experience in multi-pilot operations defined in (c) may be reduced on an individual basis, as part of the approval of the training and checking programmes. The operator may apply for such a reduced flying experience based on the unavailability of experienced pilots in both multi-pilot operations and in their types of operations. A FI/TRI/SFI rating and MCC training in helicopters should be a prerequisite for any reduced flying experience in multi-pilot operations. In addition, the operator should define mitigation measures after having performed a risk assessment. The following should be taken into account:
 - (1) flying experience criteria in single-pilot operations in the types of operations;
 - (2) any other training, checking, recency and experience criteria;
 - (3) robustness and maturity of multi-pilot SOPs.
- (e) In the case of training and checking towards the relevant aspects associated with a specialised operation, points (j)(2) to (j)(4) of [AMC1 ORO.FC.146\(e\);\(f\)&\(g\)](#) should apply.

AMC1 ORO.FC.146(c) Personnel providing training, checking and assessment

ED Decision 2022/014/R

EBT INSTRUCTOR — INITIAL STANDARDISATION PROGRAMME

- (a) Before delivering the operator's EBT programme, the instructor should complete an EBT instructor initial standardisation programme composed of:
 - (1) EBT instructor training; and
 - (2) EBT assessment of competence.

EBT INSTRUCTOR TRAINING

- (b) The EBT instructor training course should be delivered by at least one pilot who is or has been an EBT instructor, and who has demonstrated proficiency to train the elements specified in point (c) below.
- (c) The EBT instructor training course should comprise theoretical and practical training. At the completion of EBT instructor training, the instructor should:
 - (1) have knowledge of EBT, including the following underlying principles:
 - (i) competency-based training;
 - (ii) learning from positive performance;
 - (iii) building resilience; and
 - (iv) data-driven training;
 - (2) demonstrate knowledge of the structure of an EBT module;
 - (3) demonstrate knowledge of the method of training delivery for each phase of an EBT module;
 - (4) demonstrate knowledge of the principles of adult learning and how they relate to EBT;
 - (5) conduct objective observations based on a competency framework, and document evidence of observed performance;
 - (6) relate specific performance observations of competencies;
 - (7) analyse trainee performance to determine competency-based training needs and recognise strengths;
 - (8) evaluate performance using a competency-based grading system;
 - (9) apply appropriate teaching styles during simulator training to accommodate trainee learning needs;
 - (10) facilitate trainee learning, focusing on specific competency-based training needs; and
 - (11) conduct a debrief using facilitation techniques.
- (d) An instructor may be given credits for parts of point (c) if the instructor has demonstrated competencies in those topics.

EBT ASSESSMENT OF COMPETENCE

- (e) Prior to conducting assessment and training within an EBT programme, the EBT instructor should complete an EBT assessment of competence where the EBT instructor delivers:
 - (1) an evaluation phase (EVAL) and a manoeuvres training phase (MT); or
 - (2) a scenario-based training phase (SBT).
- (f) The assessment of competence has a validity period of 3 years.
- (g) The EBT assessment of competence should be conducted by a person nominated by the operator, who:
 - (1) is qualified in accordance with Annex I (Part-FCL) to [Regulation \(EU\) No 1178/2011](#) to conduct an assessment of competence; and
 - (2) has completed the EBT instructor standardisation.

- (h) The EBT assessment of competence may be combined with the assessment of competence required in Annex I (Part-FCL) to [Regulation \(EU\) No 1178/2011](#).

AMC2 ORO.FC.146(c) Personnel providing training, checking and assessment

ED Decision 2022/014/R

EBT INSTRUCTOR — RECURRENT STANDARDISATION PROGRAMME

The EBT instructor should:

- (a) conduct six EVAL or SBT phases of an EBT module (or a combination of both) every 36 months. One of the EVAL or SBT should take place in the period of 12 months immediately preceding the expiry date. The 36-month period should be counted from the end of the month the module was taken. If this has not been fulfilled, the EBT instructor should complete an EBT assessment of competence. When the module is undertaken within the last 12 months of the validity period, the new period should be counted from the original expiry date;
- (b) receive annual recurrent standardisation. The recurrent standardisation should include:
 - (1) refresher EBT training; and
 - (2) concordance training; and
- (c) complete an EBT assessment of competence every 3 years. When the assessment of competence is conducted within the 12 months preceding the expiry date, the next assessment of competence should be completed within 36 calendar months of the original expiry date of the previous assessment of competence.

GM1 ORO.FC.146(c) Personnel providing training, checking and assessment

ED Decision 2021/002/R

EBT INSTRUCTOR — INITIAL STANDARDISATION

- (a) The intent of the practical training is to ensure that EBT instructors have exposure to assessment of performance and root cause identification within an EBT programme.
- (b) EBT instructors receive practical assistance and guidance during standardisation in order to apply the learning from EBT instructor training. In particular, the focus should be on assessment of performance and the determination of root cause for remediation, plus facilitated debriefing based on root cause as a learning objective.
- (c) The pilot delivering the training may be supported by a subject matter expert (or experts). The personnel providing the EBT training is selected by the operator to assess the instructor capability in delivering EBT and provide effective feedback in order that instructor practice meets the expectations of the operator.
- (d) Practical EBT training includes the learning objective 'Evaluate performance using a competency-based grading system'. This may be done with videos and other multimedia. It means that EBT instructors are exposed to:
 - (1) different levels of pilot performance. This enables EBT instructors to distinguish between pilots performing lower than the minimum acceptable level of performance (e.g. grade 1) and those whose performance is at an acceptable level in all competencies (e.g. grade 2). This EBT training may also include other performance examples (e.g. 3, 4 and 5); and

- (2) different scenarios (e.g. complex to less complex) so that the instructor has exposure to assessments of competency in varying EBT scenarios.
- (e) The EBT instructor training course may be a minimum of 14 hours (EBT instructor training alone) and the recommended length is between 21 to 24 hours (EBT instructor training plus assessment of competence).

GM2 ORO.FC.146(c) Personnel providing training, checking and assessment

ED Decision 2021/002/R

EBT INSTRUCTOR — RECURRENT STANDARDISATION

- (a) Refresher EBT training

The intent of this training is to provide the framework for existing instructors to develop their competence to conduct EBT. Further guidance can be found in the EASA EBT manual.

- (b) Concordance training

This training is one of the elements to ensure concordance within the EBT instructor community. Those EBT instructors who do not demonstrate concordance may require further training. The operator's instructor standardisation and concordance assurance programme provides insight in the areas that an instructor (or instructor population) requires concordance training. As such, concordance training varies in content and scale depending on the need for concordance improvement.

Instructor concordance training may include candidates grading the same controlled content (e.g. a video or paper case) followed by:

- (1) a subsequent comparison of intra-group variance; and
- (2) alignment of root-cause analyses between instructors.

GM3 ORO.FC.146(c) Personnel providing training, checking and assessment

ED Decision 2021/002/R

EBT INSTRUCTOR COMPETENCY FRAMEWORK

Pilot competencies ¹	
Description:	See pilot competency framework
Instructor observable behaviour (iOB)	See pilot competency framework

¹ For ground instructors, some competencies may not apply. For the instructor assessment of competence, these competencies may not be observed. A review of the records of the instructor may be sufficient.

Management of the learning environment	
Description:	Ensures that the instruction, assessment and evaluation are conducted in a suitable and safe environment
iOB 2.1	Applies TEM in the context of instruction/evaluation
iOB 2.2	Briefs on safety procedures for situations that are likely to develop during instruction/evaluation

iOB 2.3	Intervenes appropriately, at the correct time and level (e.g. progresses from verbal assistance to taking over control)
iOB 2.4	Resumes instruction/evaluation as practicable after any intervention
iOB 2.5	Plans and prepares training media, equipment and resources
iOB 2.6	Briefs on training devices or aircraft limitations that may influence training, when applicable
iOB 2.7	Creates and manages conditions (e.g. airspace, ATC, weather, time, etc.) to be suitable for the training objectives
iOB 2.8	Adapts to changes in the environment whilst minimising training disruptions
iOB 2.9	Manages time, training media and equipment to ensure that training objectives are met

Instruction	
Description:	Conducts training to develop the trainee's competencies
iOB 3.1	References approved sources (operations, technical and training manuals, standards and regulations)
iOB 3.2	States clearly the objectives and clarifies roles for the training
iOB 3.3	Follows the approved training programme
iOB 3.4	Applies instructional methods as appropriate (e.g. explanation, demonstration, learning by discovery, facilitation, in-seat instruction)
iOB 3.5	Sustains operational relevance and realism
iOB 3.6	Adapts the amount of instructor inputs to ensure that the training objectives are met
iOB 3.7	Adapts to situations that might disrupt a planned sequence of events
iOB 3.8	Continuously assesses the trainee's competencies (e.g. by including the root cause(s) of the deficiency(-ies) observed according to the competency framework)
iOB 3.9	Encourages the trainee to self-assess
iOB 3.10	Allows the trainee to self-correct in a timely manner
iOB 3.11	Applies trainee-centred feedback techniques (e.g. facilitation, etc.)
iOB 3.12	Provides positive reinforcement

Interaction with the trainees	
Description:	Supports the trainees' learning and development and demonstrates exemplary behaviour (role model)
iOB 4.1	Shows respect for the trainee (e.g. for culture, language and experience)
iOB 4.2	Shows patience and empathy (e.g. by actively listening, reading non-verbal messages and encouraging dialogue)
iOB 4.3	Manages trainees' barriers to learning
iOB 4.4	Encourages engagement and mutual support between the trainees
iOB 4.5	Coaches the trainees
iOB 4.6	Supports the goal and training policies of the operator/ATO and authority
iOB 4.7	Shows integrity (e.g. honesty and professional principles)
iOB 4.8	Demonstrates acceptable personal conduct, acceptable social practices, content expertise, a model for professional and interpersonal behaviour
iOB 4.9	Actively seeks and accepts feedback to improve own performance

Assessment and evaluation	
Description:	Assesses the competencies of the trainee and contributes to continuous training system improvement
iOB 5.1	Complies with operator/ATO and authority requirements
iOB 5.2	Ensures that the trainee understands the assessment process
iOB 5.3	Applies the competency standards and conditions
iOB 5.4	Assesses trainee's competency (-ies)
iOB 5.5	Performs grading
iOB 5.6	Provides recommendations based on the outcome of the assessment
iOB 5.7	Makes decisions based on the outcome of assessments
iOB 5.8	Provides clear feedback to the trainee
iOB 5.9	Reports strengths and weaknesses of the training system (e.g. training environment, curriculum, assessment/evaluation) including feedback from trainees
iOB 5.10	Suggests improvements for the training system
iOB 5.11	Produces reports using appropriate forms and media

The recommended competency assessment grading system methodology for instructor competencies should be the same as the one used for pilots. This is the Venn model. More information can be found in [ORO.FC.231 point \(d\)\(1\)](#) and the related AMC and GM, as well as in the EASA EBT manual.

AMC1 ORO.FC.146(e);(f)&(g) Personnel providing training, checking and assessment

ED Decision 2022/014/R

SUITABLY QUALIFIED PIC OR COMMANDER NOMINATED BY THE OPERATOR — GENERAL

- (a) The nominated PIC/commander conducting training should either be qualified as an instructor under [Regulation \(EU\) No 1178/2011](#) or receive training which should cover at least:
 - (1) techniques of briefing and debriefing;
 - (2) CRM concepts and CRM assessment;
 - (3) for SPO, which manoeuvres the nominated PIC/commander should not train or check unless qualified as an instructor.
- (b) In addition, the nominated PIC/commander conducting operator proficiency checks or line checks should either be qualified as an examiner under [Regulation \(EU\) No 1178/2011](#) or receive additional training which should cover at least:
 - (1) how to perform a check;
 - (2) flight techniques applicable to checks performed in flight;
 - (3) the assessment of CRM skills.
- (c) The nominated PIC/commander conducting aircraft/FSTD training, line flying under supervision, operator proficiency checks or line checks taking place under multi-pilot operations in helicopters should have 350 hours flying experience in multi-pilot operations.
- (d) The nominated PICs/commanders, or the criteria for nominating PICs/commanders, should be included in the operations manual.
- (e) The nominated PIC/commander should be type rated or class rated in the type or class where he or she provides the training, checking or assessment.

CAT — SUITABLY QUALIFIED COMMANDER OR INSTRUCTOR NOMINATED BY THE OPERATOR

- (f) For CAT operations under VFR by day, the minimum experience of the nominated commander should be more than 750 hours total flight time with at least 50 hours on the type, class or the aircraft variant.
- (g) For CAT operations in performance class B aeroplanes under night VFR or under IFR, the minimum experience of the nominated commander should be more than 1 000 hours total flight time with at least 100 hours on the type, class or the aircraft variant.
- (h) In the case of CAT operations in helicopters, the 350 hours flying experience in multi-pilot operations defined in (c) may be reduced on an individual basis, as part of the approval of the training and checking programmes. The operator may apply for such a reduced flying experience based on the unavailability of experienced pilots in both multi-pilot operations and in their types of operations. An FI/TRI/SFI rating and MCC training in helicopters should be a prerequisite for any reduced flying experience in multi-pilot operations. In addition, the operator should define mitigation measures after having performed a risk assessment. The following should be taken into account:
 - (1) flying experience criteria in single-pilot operations in the types of operations;
 - (2) any other training, checking, recency and experience criteria; and
 - (3) robustness and maturity of multi-pilot SOPs.
- (i) [ORO.FC.220\(f\)](#) allows the operator to develop a specific conversion course to address an operational circumstance, when the operator intends to have pilots temporally joining the operator to conduct line checks. The content of the specific operator's conversion course is included in [AMC1 ORO.FC.220\(f\)](#).

SPO — SUITABLY QUALIFIED PIC OR INSTRUCTOR NOMINATED BY THE OPERATOR

- (j) For SPO, the person conducting the aircraft/FSTD training and the operator proficiency check should meet the following criteria:
 - (1) Training and checking covering normal, abnormal and emergency procedures relevant to the type or variant should be conducted in accordance with [AMC1 ORO.FC.146\(b\)](#).
 - (2) Training and checking covering the relevant aspects associated with HEC and HESLO should be conducted by a HEC or HESLO instructor as defined in [AMC1 SPO.SPEC.HEC.100](#) and [AMC1 SPO.SPEC.HESLO.100](#).
 - (3) Training and checking covering the relevant aspects associated with a specialised operation other than HEC and HESLO should be conducted by a nominated PIC with the following flight experience:
 - (i) at least 750 hours total flight time with at least 50 hours on the type, class or aircraft variant;
 - (ii) for specialised operations other than HEC and HESLO, either:
 - (A) at least 350 hours in the applicable specialised operation; or
 - (B) 800 hours in specialised operations and the number of hours in the applicable specialised operation as defined by the operator, based on a risk assessment, taking into account the complexity of the relevant aspects associated with the applicable specialised operation. Flight experience in HHO, firefighting flight experience and flight experience in the search component of search and rescue flights may be credited towards the 800

hours in specialised operations. In addition, up to 200 hours of experience in CAT operations (other than HHO) may be credited towards the 800 hours in specialised operations.

- (4) In addition to (2) and (3) above, flight training and checking of sensitive type-related manoeuvres in combination with the training and checking of the relevant aspects associated with a specialised task, should be conducted by a qualified instructor.
- (k) In addition to (j) above, if the SPO operator combines the operator proficiency check with a licence proficiency check, the person conducting the check should meet the requirements for licence proficiency checks.

SECTION 2 – ADDITIONAL REQUIREMENTS FOR COMMERCIAL AIR TRANSPORT OPERATIONS

ORO.FC.200 Composition of flight crew

Regulation (EU) 2021/2237

- (a) There shall not be more than one inexperienced flight crew member in any flight crew.
- (b) The commander may delegate the conduct of the flight to another pilot suitably qualified in accordance with Annex I (Part-FCL) to [Regulation \(EU\) No 1178/2011](#) provided that the requirements of [ORO.FC.105\(b\)\(1\)](#), (b)(2) and (c) are complied with.
- (c) Specific requirements for aeroplane operations under instrument flight rules (IFR) or at night.
 - (1) The minimum flight crew shall be two pilots for all turbo-propeller aeroplanes with a maximum operational passenger seating configuration (MOPSC) of more than nine and all turbojet aeroplanes.
 - (2) Aeroplanes other than those covered by (c)(1) shall be operated with a minimum crew of two pilots, unless the requirements of [ORO.FC.202](#) are complied with, in which case they may be operated by a single pilot.
- (d) Specific requirements for helicopter operations

For all operations of helicopters with an MOPSC of more than 19 and for operations under IFR of helicopters with an MOPSC of more than 9, the minimum flight crew shall be two pilots.

AMC1 ORO.FC.200(a) Composition of flight crew

ED Decision 2014/017/R

CREWING OF INEXPERIENCED FLIGHT CREW MEMBERS

The operator should establish procedures in the operations manual taking into account the following elements:

Aeroplanes

- (a) The operator should consider that a flight crew member is inexperienced, following completion of a type rating or command course, and the associated line flying under supervision, until he/she has achieved on the type either:
 - (1) 100 flight hours and flown 10 sectors within a consolidation period of 120 consecutive days; or

- (2) 150 flight hours and flown 20 sectors (no time limit).
- (b) A lesser number of flight hours or sectors, subject to any other conditions that the competent authority may impose, may be acceptable to the competent authority when one of the following applies:
 - (1) a new operator is commencing operations;
 - (2) an operator introduces a new aeroplane type;
 - (3) flight crew members have previously completed a type conversion course with the same operator;
 - (4) credits are defined in the operational suitability data established in accordance with Commission Regulation (EU) No 748/2012; or
 - (5) the aeroplane has a maximum take-off mass of less than 10 tonnes or a maximum operational passenger seating configuration (MOPSC) of less than 20.

Helicopters

- (c) The operator should consider that, when two flight crew members are required, a flight crew member, following completion of a type rating or command course, and the associated line flying under supervision, is inexperienced until either:
 - (1) he/she has achieved 50 flight hours on the type and/or in the role within a period of 60 days; or
 - (2) he/she has achieved 100 flight hours on the type and/or in the role (no time limit).
- (d) A lesser number of flight hours, on the type and/or in the role, and subject to any other conditions which the competent authority may impose, may be acceptable to the competent authority when one of the following applies:
 - (1) a new operator is commencing operations;
 - (2) an operator introduces a new helicopter type;
 - (3) flight crew members have previously completed a type conversion course with the same operator (reconversion); or
 - (4) credits are defined in the operational suitability data established in accordance with Commission Regulation (EU) No 748/2012.

ORO.FC.A.201 In-flight relief of flight crew members

Regulation (EU) No 965/2012

- (a) The commander may delegate the conduct of the flight to:
 - (1) another qualified commander; or
 - (2) for operations only above flight level (FL) 200, a pilot who complies with the following minimum qualifications:
 - (i) ATPL;
 - (ii) conversion training and checking, including type rating training, in accordance with [ORO.FC.220](#);
 - (iii) all recurrent training and checking in accordance with [ORO.FC.230](#) and [ORO.FC.240](#);

- (iv) route/area and aerodrome competence in accordance with [ORO.FC.105](#).
- (b) The co-pilot may be relieved by:
 - (1) another suitably qualified pilot;
 - (2) for operations only above FL 200, a cruise relief co-pilot that complies with the following minimum qualifications:
 - (i) valid commercial pilot licence (CPL) with an instrument rating;
 - (ii) conversion training and checking, including type rating training, in accordance with [ORO.FC.220](#) except the requirement for take-off and landing training;
 - (iii) recurrent training and checking in accordance with [ORO.FC.230](#) except the requirement for take-off and landing training.
- (c) A flight engineer may be relieved in flight by a crew member suitably qualified in accordance with applicable national rules.

ORO.FC.202 Single-pilot operations under IFR or at night

Regulation (EU) 2021/2237

In order to be able to fly under IFR or at night with a minimum flight crew of one pilot, the following shall be complied with:

- (a) The operator shall include in the operations manual a pilot's conversion and recurrent training programme that includes the additional requirements for a single-pilot operation. The pilot shall have undertaken training on the operator's procedures, in particular regarding:
 - (1) engine management and emergency handling;
 - (2) use of normal, abnormal and emergency checklist;
 - (3) air traffic control (ATC) communication;
 - (4) departure and approach procedures;
 - (5) autopilot management, if applicable;
 - (6) use of simplified in-flight documentation;
 - (7) single-pilot crew resource management.
- (b) INTENTIONALLY LEFT BLANK
- (c) For aeroplane operations under IFR the pilot shall have:
 - (1) a minimum of 50 hours flight time under IFR on the relevant type or class of aeroplane, of which 10 hours are as commander; and
 - (2) completed during the preceding 90 days on the relevant type or class of aeroplane:
 - (i) five IFR flights, including three instrument approaches, in a single-pilot role; or
 - (ii) an IFR instrument approach check.
- (d) For aeroplane operations at night the pilot shall have:
 - (1) a minimum of 15 hours flight time at night which may be included in the 50 hours flight time under IFR in (c)(1); and

- (2) completed during the preceding 90 days on the relevant type or class of aeroplane:
 - (i) three take-offs and landings at night in the single pilot role; or
 - (ii) a night take-off and landing check.
- (e) For helicopter operations under IFR the pilot shall have:
 - (1) 25 hours total IFR flight experience in the relevant operating environment; and
 - (2) 25 hours flight experience as a single pilot on the specific type of helicopter, approved for single-pilot IFR, of which 10 hours may be flown under supervision, including five sectors of IFR line flying under supervision using the single-pilot procedures; and
 - (3) completed during the preceding 90 days:
 - (i) five IFR flights as a single pilot, including three instrument approaches, carried out on a helicopter approved for this purpose; or
 - (ii) an IFR instrument approach check as a single pilot on the relevant type of helicopter, flight training device (FTD) or full flight simulator (FFS).

ORO.FC.205 Command course

Regulation (EU) No 965/2012

- (a) For aeroplane and helicopter operations, the command course shall include at least the following elements:
 - (1) training in an FSTD, which includes line oriented flight training (LOFT) and/or flight training;
 - (2) the operator proficiency check, operating as commander;
 - (3) command responsibilities training;
 - (4) line training as commander under supervision, for a minimum of:
 - (i) 10 flight sectors, in the case of aeroplanes; and
 - (ii) 10 hours, including at least 10 flight sectors, in the case of helicopters;
 - (5) completion of a line check as commander and demonstration of adequate knowledge of the route or area to be flown and of the aerodromes, including alternate aerodromes, facilities and procedures to be used; and
 - (6) crew resource management training.

AMC1 ORO.FC.205 Command course

ED Decision 2022/014/R

COMBINED UPGRADING AND CONVERSION COURSE — HELICOPTER

If a pilot is converting from one helicopter type to another when upgrading to commander:

- (a) the command course should also include a conversion course in accordance with [ORO.FC.220](#); and
- (b) additional flight sectors should be required for a pilot transitioning onto a new type of helicopter.

ORO.FC.215 Initial operator's crew resource management (CRM) training

Regulation (EU) No 965/2012

- (a) The flight crew member shall have completed an initial CRM training course before commencing unsupervised line flying.
- (b) Initial CRM training shall be conducted by at least one suitably qualified CRM trainer who may be assisted by experts in order to address specific areas.
- (c) If the flight crew member has not previously received theoretical training in human factors to the ATPL level, he/she shall complete, before or combined with the initial CRM training, a theoretical course provided by the operator and based on the human performance and limitations syllabus for the ATPL as established in Annex I (Part-FCL) to Regulation (EU) No 1178/2011.

AMC1 ORO.FC.215 Initial operator's crew resource management (CRM) training

ED Decision 2015/022/R

TRAINING ELEMENTS AND TRAINER QUALIFICATION

Initial operator's CRM training should:

- (a) cover the applicable provisions of [AMC1 ORO.FC.115](#), including the training elements as specified in Table 1 thereof; and
- (b) be conducted by a flight crew CRM trainer who is qualified as specified in [AMC3 ORO.FC.115](#).

[applicable until 25 March 2023 — ED Decision 2022/014/R]

- (b) be conducted by a flight crew CRM trainer who is qualified as specified in [AMC2 ORO.FC.146](#).

[applicable from 26 March 2023 — ED Decision 2022/014/R]

ORO.FC.220 Operator conversion training and checking

Regulation (EU) 2021/2237

- (a) CRM training shall be integrated into the operator conversion training course.
- (b) Once an operator conversion course has been commenced, the flight crew member shall not be assigned to flying duties on another type or class of aircraft until the course is completed or terminated. Crew members operating only performance class B aeroplanes may be assigned to flights on other types of performance class B aeroplanes during conversion courses to the extent necessary to maintain the operation. Crew members may be assigned to flights on single-engined helicopters during an operator conversion course on a single-engined helicopter, provided that the training is unaffected.
- (c) The amount of training required by the flight crew member for the operator's conversion course shall be determined in accordance with the standards of qualification and experience specified in the operations manual, taking into account his/her previous training and experience.
- (d) The flight crew member shall complete:
 - (1) the operator proficiency check and the emergency and safety equipment training and checking before commencing line flying under supervision (LIFUS); and

- (2) the line check upon completion of line flying under supervision. For performance class B aeroplanes, LIFUS may be performed on any aeroplane within the applicable class.
- (e) In the case of aeroplanes, pilots that have been issued a type rating based on a zero flight-time training ('ZFTT') course shall:
 - (1) commence line flying under supervision not later than 21 days after the completion of the skill test or after appropriate training provided by the operator. The content of that training shall be described in the operations manual;
 - (2) complete six take-offs and landings in an FSTD not later than 21 days after the completion of the skill test under the supervision of a type rating instructor for aeroplanes ('TRI(A)') occupying the other pilot seat. The number of take-offs and landings may be reduced when credits are defined in the mandatory part of the operational suitability data established in accordance with [Regulation \(EU\) No 748/2012](#). If those take-offs and landings have not been performed within 21 days, the operator shall provide refresher training the content of which shall be described in the operations manual;
 - (3) conduct the first four take-offs and landings of the LIFUS in the aeroplane under the supervision of a TRI(A) occupying the other pilot seat. The number of take-offs and landings may be reduced when credits are defined in the mandatory part of the operational suitability data established in accordance with [Regulation \(EU\) No 748/2012](#).
- (f) If operational circumstances, such as applying for a new AOC or adding a new aircraft type or class to the fleet, do not allow the operator to comply with the requirements in (d), the operator may develop a specific conversion course, to be used temporarily for a limited number of pilots.

AMC1 ORO.FC.220 Operator conversion training and checking

ED Decision 2015/022/R

OPERATOR CONVERSION TRAINING SYLLABUS

- (a) General
 - (1) The operator conversion training should include, in the following order:
 - (i) ground training and checking, including aircraft systems, and normal, abnormal and emergency procedures;
 - (ii) emergency and safety equipment training and checking, (completed before any flight training in an aircraft commences);
 - (iii) flight training and checking (aircraft and/or FSTD); and
 - (iv) line flying under supervision and line check.
 - (2) When the flight crew member has not previously completed an operator's conversion course, he/she should undergo general first-aid training and, if applicable, ditching procedures training using the equipment in water.
 - (3) Where the emergency drills require action by the non-handling pilot, the check should additionally cover knowledge of these drills.
 - (4) The operator's conversion may be combined with a new type/class rating training, as required by Commission Regulation (EU) No 1178/2011.

-
- (5) The operator should ensure that:
- (i) applicable elements of CRM training, as specified in Table 1 of [AMC1 ORO.FC.115](#), are integrated into all appropriate phases of the conversion training; and
 - (ii) the personnel integrating elements of CRM into conversion training are suitably qualified, as specified in [AMC3 ORO.FC.115](#).
- (b) Ground training
- (1) Ground training should comprise a properly organised programme of ground instruction supervised by training staff with adequate facilities, including any necessary audio, mechanical and visual aids. Self-study using appropriate electronic learning aids, computer-based training (CBT), etc., may be used with adequate supervision of the standards achieved. However, if the aircraft concerned is relatively simple, unsupervised private study may be adequate if the operator provides suitable manuals and/or study notes.
 - (2) The course of ground instruction should incorporate formal tests on such matters as aircraft systems, performance and flight planning, where applicable.
- (c) Emergency and safety equipment training and checking
- (1) Emergency and safety equipment training should take place in conjunction with cabin/technical crew undergoing similar training with emphasis on coordinated procedures and two-way communication between the flight crew compartment and the cabin.
 - (2) On the initial conversion course and on subsequent conversion courses as applicable, the following should be addressed:
 - (i) Instruction on first-aid in general (initial conversion course only); instruction on first-aid as relevant to the aircraft type of operation and crew complement, including those situations where no cabin crew is required to be carried (initial and subsequent).
 - (ii) Aero-medical topics, including:
 - (A) hypoxia;
 - (B) hyperventilation;
 - (C) contamination of the skin/eyes by aviation fuel or hydraulic or other fluids;
 - (D) hygiene and food poisoning; and
 - (E) malaria.
 - (iii) The effect of smoke in an enclosed area and actual use of all relevant equipment in a simulated smoke-filled environment.
 - (iv) Actual fire fighting, using equipment representative of that carried in the aircraft on an actual or simulated fire except that, with Halon extinguishers, an alternative extinguisher may be used.
 - (v) The operational procedures of security, rescue and emergency services.
 - (vi) Survival information appropriate to their areas of operation (e.g. polar, desert, jungle or sea) and training in the use of any survival equipment required to be carried.

- (vii) A comprehensive drill to cover all ditching procedures where flotation equipment is carried. This should include practice of the actual donning and inflation of a life-jacket, together with a demonstration or audio-visual presentation of the inflation of life-rafts and/or slide-rafts and associated equipment. This practice should, on an initial conversion course, be conducted using the equipment in water, although previous certified training with another operator or the use of similar equipment will be accepted in lieu of further wet-drill training.
 - (viii) Instruction on the location of emergency and safety equipment, correct use of all appropriate drills, and procedures that could be required of flight crew in different emergency situations. Evacuation of the aircraft (or a representative training device) by use of a slide where fitted should be included when the operations manual procedure requires the early evacuation of flight crew to assist on the ground.
- (d) Flight training
 - (1) Flight training should be conducted to familiarise the flight crew member thoroughly with all aspects of limitations and normal, abnormal and emergency procedures associated with the aircraft and should be carried out by suitably qualified class and type rating instructors and/or examiners. For specific operations, such as steep approaches, ETOPS, or operations based on QFE, additional training should be carried out, based on any additional elements of training defined for the aircraft type in the operational suitability data in accordance with Commission Regulation (EU) No 748/2012, where they exist.
 - (2) In planning flight training on aircraft with a flight crew of two or more, particular emphasis should be placed on the practice of LOFT with emphasis on CRM, and the use of crew coordination procedures, including coping with incapacitation.
 - (3) Normally, the same training and practice in the flying of the aircraft should be given to co-pilots as well as commanders. The 'flight handling' sections of the syllabus for commanders and co-pilots alike should include all the requirements of the operator proficiency check required by [ORO.FC.230](#).
 - (4) Unless the type rating training programme has been carried out in an FSTD usable for ZFTT, the training should include at least three take-offs and landings in the aircraft.
- (e) Line flying under supervision (LIFUS)
 - (1) Following completion of flight training and checking as part of the operator's conversion course, each flight crew member should operate a minimum number of sectors and/or flight hours under the supervision of a flight crew member nominated by the operator.
 - (2) The minimum flight sectors/hours should be specified in the operations manual and should be determined by the following:
 - (i) previous experience of the flight crew member;
 - (ii) complexity of the aircraft; and
 - (iii) the type and area of operation.
 - (3) For performance class B aeroplanes, the amount of LIFUS required is dependent on the complexity of the operations to be performed.
- (f) Passenger handling for operations where no cabin crew is required

Other than general training on dealing with people, emphasis should be placed on the following:

- (1) advice on the recognition and management of passengers who appear or are intoxicated with alcohol, under the influence of drugs or aggressive;
 - (2) methods used to motivate passengers and the crowd control necessary to expedite an aircraft evacuation; and
 - (3) the importance of correct seat allocation with reference to aircraft mass and balance. Particular emphasis should also be given on the seating of special categories of passengers.
- (g) Discipline and responsibilities, for operations where no cabin crew is required
- Emphasis should be placed on discipline and an individual's responsibilities in relation to:
- (1) his/her ongoing competence and fitness to operate as a crew member with special regard to flight and duty time limitation (FTL) requirements; and
 - (2) security procedures.
- (h) Passenger briefing/safety demonstrations, for operations where no cabin crew is required
- Training should be given in the preparation of passengers for normal and emergency situations.

[AMC1 ORO.FC.220 applicable until 25 March 2023 — ED Decision 2022/014/R]

AMC1 ORO.FC.220 Operator conversion training and checking

ED Decision 2022/014/R

OPERATOR CONVERSION TRAINING SYLLABUS

- (a) General
- (1) The operator conversion training should include, in the following order:
 - (i) ground training and checking, including all of the following:
 - (A) aircraft systems;
 - (B) normal procedures, which include flight planning and ground-handling and flight operations, including performance, mass and balance, fuel schemes, selection of alternates, and ground de-icing/anti-icing;
 - (C) abnormal and emergency procedures, which include pilot incapacitation as applicable;
 - (D) a review of relevant samples of accident/incident and occurrences to increase awareness of the occurrences that may be relevant for the intended operation;
 - (ii) emergency and safety equipment training and checking (completed before any flight training in an aircraft commences);
 - (iii) flight training and checking (aircraft and/or FSTD); and
 - (iv) line flying under supervision and line check.
 - (2) When the flight crew member has not previously completed an operator's conversion course, he/she should undergo general first-aid training and, if applicable, ditching procedures training using the equipment in water.
 - (3) Where the emergency drills require action by the non-handling pilot, the check should additionally cover knowledge of these drills.

-
- (4) The operator's conversion may be combined with a new type/class rating training, as required by [Commission Regulation \(EU\) No 1178/2011](#).
 - (5) The operator should ensure that:
 - (i) applicable elements of CRM training, as specified in Table 1 of [AMC1 ORO.FC.115](#), are integrated into all appropriate phases of the conversion training; and
 - (ii) the personnel integrating elements of CRM into conversion training are suitably qualified, as specified in [AMC2 ORO.FC.146](#).
 - (b) Ground training
 - (1) Ground training should comprise a properly organised programme of ground instruction supervised by training staff with adequate facilities, including any necessary audio, mechanical and visual aids. Self-study using appropriate electronic learning aids, computer-based training (CBT), etc., may be used with adequate supervision of the standards achieved. However, if the aircraft concerned is relatively simple, unsupervised private study may be adequate if the operator provides suitable manuals and/or study notes.
 - (2) The course of ground instruction should incorporate formal tests.
 - (c) Emergency and safety equipment training and checking
 - (1) Emergency and safety equipment training should take place in conjunction with cabin/technical crew undergoing similar training with emphasis on coordinated procedures and two-way communication between the flight crew compartment and the cabin.
 - (2) On the initial conversion course and on subsequent conversion courses as applicable, the following should be addressed:
 - (i) Instruction on first-aid in general (initial conversion course only); instruction on first-aid as relevant to the aircraft type of operation and crew complement, including those situations where no cabin crew is required to be carried (initial and subsequent).
 - (ii) Aero-medical topics, including:
 - (A) hypoxia;
 - (B) hyperventilation;
 - (C) contamination of the skin/eyes by aviation fuel or hydraulic or other fluids;
 - (D) hygiene and food poisoning; and
 - (E) malaria.
 - (iii) The effect of smoke in an enclosed area and actual use of all relevant equipment in a simulated smoke-filled environment.
 - (iv) Actual fire fighting, using equipment representative of that carried in the aircraft on an actual or simulated fire except that, with Halon extinguishers, an alternative extinguisher may be used.
 - (v) The operational procedures of security, rescue and emergency services.

- (vi) Survival information appropriate to their areas of operation (e.g. polar, desert, jungle or sea) and training in the use of any survival equipment required to be carried.
 - (vii) A comprehensive drill to cover all ditching procedures where flotation equipment is carried. This should include practice of the actual donning and inflation of a life-jacket, together with a demonstration or audio-visual presentation of the inflation of life-rafts and/or slide-rafts and associated equipment. This practice should, on an initial conversion course, be conducted using the equipment in water, although previous certified training with another operator or the use of similar equipment will be accepted in lieu of further wet-drill training.
 - (viii) Instruction on the location of emergency and safety equipment, correct use of all appropriate drills, and procedures that could be required of flight crew in different emergency situations. Evacuation of the aircraft (or a representative training device) by use of a slide where fitted should be included when the operations manual procedure requires the early evacuation of flight crew to assist on the ground.
- (3) Operations where no cabin crew is required
- (i) Passenger handling

Other than general training on dealing with people, emphasis should be placed on the following:

 - (A) advice on the recognition and management of passengers who appear or are intoxicated with alcohol, under the influence of drugs or aggressive;
 - (B) methods used to motivate passengers and the crowd control necessary to expedite an aircraft evacuation; and
 - (C) the importance of correct seat allocation with reference to aircraft mass and balance. Particular emphasis should also be given on the seating of special categories of passengers.
 - (ii) Discipline and responsibilities

Emphasis should be placed on discipline and an individual's responsibilities in relation to:

 - (A) his or her ongoing competence and fitness to operate as a crew member with special regard to flight and duty time limitation (FTL) requirements; and
 - (B) security procedures.
 - (iii) Passenger briefing/safety demonstrations

Training should be given in the preparation of passengers for normal and emergency situations.
- (d) Flight training
- (1) Flight training should be conducted to familiarise the flight crew member thoroughly with all aspects of limitations and normal, abnormal and emergency procedures associated with the aircraft and should be carried out by suitably qualified class and type rating instructors and/or examiners. For specific operations, such as steep approaches, ETOPS, or operations based on QFE, additional training should be carried out, based on any

additional elements of training defined for the aircraft type in the operational suitability data in accordance with [Commission Regulation \(EU\) No 748/2012](#), where they exist.

- (2) In planning flight training on aircraft with a flight crew of two or more, particular emphasis should be placed on the practice of LOFT with emphasis on CRM, and the use of crew coordination procedures, including coping with incapacitation.
 - (3) Normally, the same training and practice in the flying of the aircraft should be given to co-pilots as well as commanders. The 'flight handling' sections of the syllabus for commanders and co-pilots alike should include all the requirements of the operator proficiency check required by [ORO.FC.230](#).
 - (4) Unless the type rating training programme has been carried out in an FSTD usable for ZFTT, the training should include at least three take-offs and landings in the aircraft.
- (e) Operator proficiency check
- (1) For aeroplanes, the operator proficiency check that is part of the operator's conversion checking should follow the provisions in [AMC1 ORO.FC.230](#). For EBT, the operator should include either an EBT module in accordance with [ORO.FC.231](#) or an OPC in accordance with [AMC1 ORO.FC.230](#).
 - (2) For helicopters, the operator proficiency check that is part of the operator's conversion checking should include at least the following emergency/abnormal procedures as relevant to the helicopter and operations:
 - (i) engine fire;
 - (ii) interior helicopter fire or smoke;
 - (iii) emergency operation of undercarriage;
 - (iv) hydraulic failure;
 - (v) electrical failure;
 - (vi) flight and engine control system malfunctions;
 - (vii) recovery from unusual attitudes;
 - (viii) landing with one or more engine(s) inoperative;
 - (ix) instrument meteorological conditions (IMC) autorotation techniques;
 - (x) autorotation to a designated area;
 - (xi) pilot incapacitation;
 - (xii) directional control failures and malfunctions; and
 - (xiii) engine failure and if relevant, relight;and for multi-engined helicopters:
 - (xiv) engine failure during take-off before decision point;
 - (xv) engine failure during take-off after decision point;
 - (xvi) engine failure during landing before decision point; and
 - (xvii) engine failure during landing after decision point.
 - (3) For helicopter pilots required to engage in IFR operations, the proficiency check should include the following additional normal/abnormal/emergency procedures:

- (i) 3D approach operation to minima;
 - (ii) go-around on instruments;
 - (iii) 2D approach operation to minima;
 - (iv) if relevant, at least one of the 3D or 2D approach operations should be an RNP APCH or RNP AR APCH operation;
 - (v) in the case of multi-engined helicopters, a simulated failure of one engine to be included in either the 3D or 2D approach operation to minima; and
 - (vi) where appropriate to the helicopter type, approach with flight control system/flight director system malfunctions, flight instrument and navigation equipment failures.
- (4) For helicopters, the flight crew should be assessed on their CRM skills in accordance with the methodology described in [AMC1 ORO.FC.115](#) and as specified in the operations manual.
- (5) The use of FSTDs, composition of the flight crew, and the possible combinations with training or with the licence proficiency check should be defined as per [AMC1 ORO.FC.230](#).
- (f) Line flying under supervision (LIFUS)
 - (1) Following completion of flight training and checking as part of the operator's conversion course, each flight crew member should operate a minimum number of sectors and/or flight hours under the supervision of a flight crew member nominated by the operator.
 - (2) The minimum flight sectors/hours should be specified in the operations manual and should be determined by the following:
 - (i) previous experience of the flight crew member;
 - (ii) complexity of the aircraft; and
 - (iii) the type and area of operation.
 - (3) For performance class B aeroplanes, the amount of LIFUS required is dependent on the complexity of the operations to be performed.

[AMC1 ORO.FC.220 applicable from 26 March 2023]

AMC2 ORO.FC.220 Operator conversion training and checking

ED Decision 2014/017/R

OPERATOR CONVERSION TRAINING SYLLABUS — FLIGHT ENGINEERS

- (a) Operator conversion training for flight engineers should approximate to that of pilots.
- (b) If the flight crew includes a pilot with the duties of a flight engineer, he/she should, after training and the initial check in these duties, operate a minimum number of flight sectors under the supervision of a nominated additional flight crew member. The minimum figures should be specified in the operations manual and should be selected after due note has been taken of the complexity of the aircraft and the experience of the flight crew member.

AMC3 ORO.FC.220 Operator conversion training and checking

ED Decision 2022/014/R

TRAINING PROGRAMMES

The operator should ensure that training programmes include the relevant de-identified feedback from the management system, including occurrence reporting and flight data monitoring programmes.

[applicable from 26 March 2023]

AMC1 ORO.FC.220(b) Operator conversion training and checking

ED Decision 2022/014/R

ASSIGNMENT TO FLIGHTS DURING AN OPERATOR CONVERSION COURSE — HELICOPTERS

- (a) A group of helicopter types should include either only single-engined turbine helicopters operated only under VFR or only single-engined piston helicopters operated only under VFR.
- (b) The flight crew member should only be assigned to flights on a helicopter within the same group of helicopter types as the type used for the operator conversion training and checking.
- (c) Once an operator conversion course has been commenced, the flight crew member should not start another operator conversion course on another helicopter type until that course is completed or terminated.

GM1 ORO.FC.220(b) Operator conversion training and checking

ED Decision 2014/017/R

COMPLETION OF AN OPERATOR'S CONVERSION COURSE

- (a) The operator conversion course is deemed to have started when the flight training has begun. The theoretical element of the course may be undertaken ahead of the practical element.
- (b) Under certain circumstances the course may have started and reached a stage where, for unforeseen reasons, it is not possible to complete it without a delay. In these circumstances, the operator may allow the pilot to revert to the original type.
- (c) Before the resumption of the operator conversion course, the operator should evaluate how much of the course needs to be repeated before continuing with the remainder of the course.

GM1 ORO.FC.220(c) Operator conversion training and checking

ED Decision 2016/008/R

OPERATOR CONVERSION COURSE (OCC) FOR MULTI-CREW PILOT LICENCE (MPL) HOLDERS

When defining the amount of training for MPL holders, who undertake their first conversion course on a new type or at an operator other than the one that was involved in their training for the MPL, the operator should put a process in place to ensure that corrective action can be taken if post-MPL licence training evaluation indicates the need to do so.

GM1 ORO.FC.220(d) Operator conversion training and checking

ED Decision 2014/017/R

LINE FLYING UNDER SUPERVISION

- (a) Line flying under supervision provides the opportunity for a flight crew member to carry into practice the procedures and techniques he/she has been made familiar with during the ground and flight training of an operator conversion course. This is accomplished under the supervision of a flight crew member specifically nominated and trained for the task. At the end of line flying under supervision the respective crew member should be able to perform a safe and efficient flight conducted within the tasks of his/her crew member station.
- (b) A variety of reasonable combinations may exist with respect to:
 - (1) a flight crew member's previous experience;
 - (2) the complexity of the aircraft concerned; and
 - (3) the type of route/role/area operations.

- (c) Aeroplanes

The following minimum figures for details to be flown under supervision are guidelines for operators to use when establishing their individual requirements:

- (1) turbo-jet aircraft
 - (i) co-pilot undertaking first operator conversion course:
 - (A) total accumulated 100 hours or minimum 40 flight sectors;
 - (ii) co-pilot upgrading to commander:
 - (A) minimum 20 flight sectors when converting to a new type;
 - (B) minimum 10 flight sectors when already qualified on the aeroplane type.

AMC1 ORO.FC.220(f) Operator conversion training and checking

ED Decision 2022/014/R

SPECIFIC CONVERSION COURSE — SUITABLY QUALIFIED COMMANDER NOMINATED BY THE OPERATOR — PILOTS WHO TEMPORARILY JOIN THE OPERATOR AND WILL BE NOMINATED TO CONDUCT LINE CHECKS

- (a) In some cases, operational circumstances may require the operator to develop a specific conversion course to nominate pilots as suitably qualified commanders to conduct line checks in accordance with the requirements of [ORO.FC.146](#). In this case, the operator conversion training should include training as follows:
 - (1) normal procedures, which include flight planning and ground-handling and flight operations, including performance, mass and balance, fuel schemes, selection of alternates, and ground de-icing/anti-icing;
 - (2) abnormal and emergency procedures, which include pilot incapacitation as applicable.
- (b) The operator should ensure that the line checker is familiar with:
 - (1) the operating procedures and the use of checklists used by the operator;
 - (2) the emergency and safety equipment installed or carried on the operated aircraft.

- (c) After the completion of the specific conversion course, the following apply:
- (1) The line checker should not exercise duties at the controls of the aircraft.
 - (2) The line checker should only conduct recurrent line checks of pilots whose previous line check has not expired, in accordance with [ORO.FC.230](#).
- (d) The validity of the specific conversion course should be limited to 6 months.

GM1 ORO.FC.220(f) Operator conversion training and checking

ED Decision 2022/014/R

SPECIF CONVERSION COURSE TO BE USE TEMPORARILY FOR A LIMITED NUMBER OF PILOTS — NEW AOC OR ADDITION OF A NEW AIRCRAFT TYPE OR CLASS TO THE FLEET

For a new AOC or for the addition of a new aircraft type or class to the fleet, the operator may contact the competent authority to agree on a specific conversion course to be included in the operations manual (CAT requires approval in accordance with [ORO.FC.145 point \(c\)](#)) to be used temporarily for a limited number of pilots. The specific course may include an agreement on the minimum experience of the pilots, the required experience of the line supervisor and line checkers amongst others.

AMC1 ORO.FC.220&230 Operator conversion training and checking & recurrent training and checking

ED Decision 2019/025/R

UPSET PREVENTION AND RECOVERY TRAINING (UPRT) FOR COMPLEX MOTOR-POWERED AEROPLANES WITH A MAXIMUM OPERATIONAL PASSENGER SEATING CONFIGURATION (MOPSC) OF MORE THAN 19

- (a) Upset prevention training should:
- (1) consist of ground training and flight training in an FSTD or an aeroplane;
 - (2) include upset prevention elements from Table 1 for the conversion training course; and
 - (3) include upset prevention elements in Table 1 for the recurrent training programme at least every 12 calendar months, such that all the elements are covered over a period not exceeding 3 years.

Table 1: Elements and respective components of upset prevention training

Elements and components		Ground training	FSTD/ Aeroplane training
A.	Aerodynamics		
1.	General aerodynamic characteristics	•	
2.	Aeroplane certification and limitations	•	
3.	Aerodynamics (high and low altitudes)	•	•
4.	Aeroplane performance (high and low altitudes)	•	•
5.	Angle of attack (AOA) and stall awareness	•	•
6.	Stick shaker or other stall-warning device activation (as applicable)	•	•
7.	Stick pusher (as applicable)	•	•
8.	Mach effects (if applicable to the aeroplane type)	•	•
9.	Aeroplane stability	•	•
10.	Control surface fundamentals	•	•

Elements and components		Ground training	FSTD/ Aeroplane training
11.	Use of trims	•	•
12.	Icing and contamination effects	•	•
13.	Propeller slipstream (as applicable)	•	•
B.	Causes of and contributing factors to upsets		
1.	Environmental	•	
2.	Pilot-induced	•	
3.	Mechanical (aeroplane systems)	•	
C.	Safety review of accidents and incidents relating to aeroplane upsets		
1.	Safety review of accidents and incidents relating to aeroplane upsets	•	
D.	g-load awareness and management		
1.	Positive/negative/increasing/decreasing g-loads	•	•
2.	Lateral g awareness (sideslip)	•	•
3.	g-load management	•	•
E.	Energy management		
1.	Kinetic energy vs potential energy vs chemical energy (power)	•	•
F.	Flight path management		
1.	Relationship between pitch, power and performance	•	•
2.	Performance and effects of differing power plants (if applicable)	•	•
3.	Manual and automation inputs for guidance and control	•	•
4.	Type-specific characteristics	•	•
5.	Management of go-arounds from various stages during the approach	•	•
6.	Automation management	•	•
7.	Proper use of rudder	•	•
G.	Recognition		
1.	Type-specific examples of physiological, visual and instrument clues during developing and developed upsets	•	•
2.	Pitch/power/roll/yaw	•	•
3.	Effective scanning (effective monitoring)	•	•
4.	Type-specific stall protection systems and cues	•	•
5.	Criteria for identifying stalls and upsets	•	•
H.	System malfunction (including immediate handling and subsequent operational considerations, as applicable)		
1.	Flight control defects	•	•
2.	Engine failure (partial or full)	•	•
3.	Instrument failures	•	•
4.	Loss of reliable airspeed	•	•
5.	Automation failures	•	•
6.	Fly-by-wire protection degradations	•	•
7.	Stall protection system failures including icing alerting systems	•	•
I.	Manual handling skills (no autopilot, no autothrust/autothrottle and, where possible, without flight directors)		
1.	Flight at different speeds, including slow flight, and altitudes within the full normal flight envelope		•

Elements and components		Ground training	FSTD/ Aeroplane training
2.	Procedural instrument flying and manoeuvring including instrument departure and arrival		•
3.	Visual approach		•
4.	Go-arounds from various stages during the approach (refer to point (d) of GM1 to Appendix 9 to Part-FCL ¹ for further guidance on go-around training)	•	•
5.	Steep turns		•

(b) Upset recovery training should:

- (1) consist of ground training and flight training in an FFS qualified for the training task;
- (2) be completed from each seat in which a pilot's duties require him/her to operate; and
- (3) include the recovery exercises in Table 2 for the recurrent training programme, such that all the exercises are covered over a period not exceeding 3 years.

Table 2: Exercises for upset recovery training

Exercises		Ground training	FFS training
A.	Recovery from developed upsets		
1.	Timely and appropriate intervention	•	•
2.	Recovery from stall events, in the following configurations; <ul style="list-style-type: none"> — take-off configuration, — clean configuration low altitude, — clean configuration near maximum operating altitude, and — landing configuration during the approach phase. 	•	•
3.	Recovery from nose high at various bank angles	•	•
4.	Recovery from nose low at various bank angles	•	•
5.	Consolidated summary of aeroplane recovery techniques	•	•

- (c) The operator should ensure that personnel providing FSTD UPRT are competent and current to deliver the training, and understand the capabilities and limitations of the device used.
- (d) An FFS that is used for the training referred to in point (b)(1) should be qualified in accordance with the special evaluation requirements set out in CS-FSTD(A) (Issue 2 or later).

AMC2 ORO.FC.220&230 Operator conversion training and checking & recurrent training and checking

ED Decision 2019/025/R

UPSET PREVENTION AND RECOVERY TRAINING (UPRT) FOR COMPLEX MOTOR-POWERED AEROPLANES WITH A MAXIMUM OPERATIONAL PASSENGER SEATING CONFIGURATION (MOPSC) OF 19 OR LESS

- (a) Upset prevention training should:
 - (1) consist of ground training and flight training in an FSTD or an aeroplane;
 - (2) include upset prevention elements in Table 1 of [AMC1 ORO.FC.220&230](#) for the conversion training course; and
 - (3) include upset prevention elements in Table 1 of [AMC1 ORO.FC.220&230](#) for the recurrent training programme at least every 12 calendar months, such that all the elements are covered over a period not exceeding 3 years.
- (b) Upset recovery training should:
 - (1) consist of ground training and flight training in an FFS qualified for the training task, if available;
 - (2) be completed from each seat in which a pilot's duties require him/her to operate; and
 - (3) include the recovery exercises in Table 2 of [AMC1 ORO.FC.220&230](#) for the recurrent training programme, such that all the exercises are covered over a period not exceeding 3 years.
- (c) The operator should ensure that personnel providing FSTD UPRT are competent and current to deliver the training, and understand the capabilities and limitations of the device used.
- (d) An FFS that is used for the training referred to in point (b)(1) should be qualified in accordance with the special evaluation requirements set out in CS-FSTD(A) (Issue 2 or later).

GM1 ORO.FC.220&230 Operator conversion training and checking & recurrent training and checking

ED Decision 2019/005/R

UPSET PREVENTION AND RECOVERY TRAINING (UPRT) FOR COMPLEX MOTOR-POWERED AEROPLANES

The objective of the UPRT is to help flight crew acquire the required competencies in order to prevent or recover from a developing or developed aeroplane upset. Prevention training prepares flight crew to avoid incidents whereas recovery training prepares flight crew to prevent an accident once an upset condition has developed.

HUMAN FACTORS

Threat and Error Management (TEM) and Crew Resource Management (CRM) principles should be integrated into the UPRT. In particular, the surprise and startle effect, and the importance of resilience development should be emphasised.

Training should also emphasise that an actual upset condition may expose flight crew to significant physiological and psychological challenges, such as visual illusions, spatial disorientation and unusual g-forces, with the objective to develop strategies to deal with such challenges.

USE OF FSTD FOR UPRT

The use of an FSTD provides valuable training without the risks associated with aeroplane training. The training envelope (envelope within which all training exercises will be carried out) should be specified by the operator in terms of the range of attitudes, speed and g-loads that can be used for training, taking into account:

- (1) the training environment;
- (2) the capabilities of the instructors; and
- (3) in the case of training in FSTDs, the limitations of the FSTD (as per [GM15 to Annex I](#) (Definitions) to Commission Regulation (EU) No 965/2012 for the FSTD training envelope); and
- (4) in the case of training in aeroplanes, the capabilities and certification of the aeroplane, while considering a margin of safety in order to ensure that unintentional deviations from the training envelope will not exceed aeroplane limitations. Different training envelopes may be specified for different aeroplane types even within a single training course.

ADDITIONAL GUIDANCE

Specific guidance to the UPRT elements and exercises contained in the AMC is available from the latest revision of the ICAO Document 10011 ('Manual on UPRT').

Further guidance is available in:

- Revision 2 (as regards training scenarios for UPRT) and Revision 3 of the Aeroplane Upset Recovery Training Aid (AURTA (Revision 2) / AUPRTA (Revision 3)); and
- the Flight Safety Foundation Publication ('A Practical Guide for Improving Flight Path Monitoring'), November 2014.

GM2 ORO.FC.220&230 Operator conversion training and checking & recurrent training and checking

ED Decision 2019/005/R

UPSET PREVENTION TRAINING FOR COMPLEX MOTOR-POWERED AEROPLANES

The recurrent training should prioritise the upset prevention elements and respective components according to the operator's safety risk assessment.

Upset prevention training should use a combination of manoeuvre-based and scenario-based training. Scenario-based training may be used to introduce flight crew to situations which, if not correctly managed, could lead to an upset condition. Relevant TEM and CRM aspects should be included in scenario-based training and the flight crew should understand the limitations of the FSTD in replicating the physiological and psychological aspects of exposure to upset prevention scenarios.

In order to avoid negative training and negative transfer of training, operators should ensure that the selected upset prevention scenarios and exercises take into consideration the limitations of the FSTD and the extent to which it represents the handling characteristics of the actual aeroplane. If it is determined that the FSTD is not suitable, the operator should ensure that the required training outcome can be achieved by other means.

GO-AROUNDS FROM VARIOUS STAGES DURING THE APPROACH

Guidance on go-around training is provided in point (d) of GM1 to Appendix 9 to Part-FCL.

GM3 ORO.FC.220&230 Operator conversion training and checking & Recurrent training and checking

ED Decision 2019/025/R

UPSET RECOVERY TRAINING FOR COMPLEX MOTOR-POWERED AEROPLANES

The upset recovery training exercises should be manoeuvre-based, which enables flight crew to apply their handling skills and recovery strategy whilst leveraging CRM principles to return the aeroplane from an upset condition to a stabilised flight path.

The flight crew should understand the limitations of the FFS in replicating the physiological and psychological aspects of upset recovery exercises.

In order to avoid negative training and negative transfer of training, operators should ensure that the selected upset recovery exercises take into consideration the limitations of the FFS.

STALL EVENT RECOVERY TRAINING

It is of utmost importance that stall event recovery training takes into account the capabilities of the FFS used. To deliver stall event recovery training, the FFS should be qualified against the relevant UPRT elements of CS-FSTD(A) (Issue 2 or later). Stall event recovery training should include training up to the stall (approach-to-stall). Post-stall training may be delivered, provided the device has been qualified against the relevant optional elements of CS-FSTD(A) (Issue 2 or later) and the operator demonstrates that negative training or negative transfer of training is avoided. A 'stall event' is defined as an occurrence whereby the aeroplane experiences one or more conditions associated with an approach-to-stall or stall.

Stall event recovery training should emphasise the requirement to reduce the angle of attack (AOA) whilst accepting the resulting altitude loss. High-altitude stall event training should be included so that flight crew appreciate the aeroplane control response, the significant altitude loss during the recovery, and the increased time required. The training should also emphasise the risk of triggering a secondary stall event during the recovery.

Recovery from a stall event should always be in accordance with the stall event recovery procedures of the OEMs. If an OEM-approved recovery procedure does not exist, operators should develop and train the aeroplane-specific stall recovery procedure based on the template in Table 1 below.

Refer to Revision 3 of the Airplane Upset Prevention and Recovery Training Aid (AUPRTA) for a detailed explanation and rationale on the stall event recovery template as recommended by the OEMs.

Table 1: Recommended Stall Event Recovery Template

Stall Event Recovery Template		
Pilot Flying - Immediately do the following at first indication of a stall (aerodynamic buffeting, reduced roll stability and aileron effectiveness, visual or aural cues and warnings, reduced elevator (pitch) authority, inability to maintain altitude or arrest rate of descent, stick shaker activation (if installed).) – during any flight phases <i>except at lift-off</i> .		
Pilot Flying (PF)		Pilot Monitoring (PM)
1.	AUTOPILOT – DISCONNECT (A large out-of-trim condition could be encountered when the autopilot is disconnected.)	MONITOR airspeed and attitude throughout the

2.	AUTOTHRUST/AUTOTHROTTLE – OFF	recovery and ANNOUNCE any continued divergence
3.	a) NOSE DOWN PITCH CONTROL apply until stall warning is eliminated b) NOSE DOWN PITCH TRIM (as needed) (Reduce the angle of attack (AOA) whilst accepting the resulting altitude loss.)	
4.	BANK – WINGS LEVEL	
5.	THRUST – ADJUST (as needed) (Thrust reduction for aeroplanes with underwing mounted engines may be needed)	
6.	SPEEDBRAKES/SPOILERS - RETRACT	
7.	When airspeed is sufficiently increasing - RECOVER to level flight (Avoid the secondary stall due premature recovery or excessive g-loading.)	

NOSE HIGH AND NOSE LOW RECOVERY TRAINING

Nose-high and nose-low recovery training should be in accordance with the strategies recommended by the OEMs contained in the Tables 2 and 3 below. As the OEM procedures always take precedence over the recommendations, operators should consult their OEM on whether any approved type-specific recovery procedures are available prior to using the templates.

Refer to Revision 3 of the Airplane Upset Prevention and Recovery Training Aid (AUPRTA) for a detailed explanation and rationale on the nose high and nose low recovery strategies as recommended by the OEMs.

Table 2: Recommended Nose High Recovery Strategy Template

Nose HIGH Recovery Strategy		
Either pilot - Recognise and confirm the developing situation by announcing: ‘Nose High’		
PF		PM
1.	AUTOPILOT – DISCONNECT (A large out of trim condition could be encountered when the AP is disconnected.)	MONITOR airspeed and attitude throughout the recovery and ANNOUNCE any continued divergence
2.	AUTOTHRUST/AUTOTHROTTLE – OFF	
3.	APPLY as much nose-down control input as required to obtain a nose-down pitch rate	
4.	THRUST – ADJUST (if required) (Thrust reduction for aeroplanes with underwing mounted engines may be needed.)	
5.	ROLL – ADJUST (if required) (Avoid exceeding 60 degrees bank.)	
6.	When airspeed is sufficiently increasing - RECOVER to level flight (Avoid the secondary stall due premature recovery or excessive g-loading.)	
NOTE:		
1)	Recovery to level flight may require use of pitch trim.	
2)	If necessary, consider reducing thrust in aeroplanes with underwing-mounted engines to aid in achieving nose-down pitch rate.	
3)	WARNING: Excessive use of pitch trim or rudder may aggravate the upset situation or may result in high structural loads.	

Table 3: Recommended Nose Low Recovery Strategy Template

Nose LOW Recovery Strategy Template		
Either pilot - Recognise and confirm the developing situation by announcing: ‘Nose Low’ (If the autopilot or autothrust/autothrottle is responding correctly, it may not be appropriate to decrease the level of automation while assessing if the divergence is being stopped.)		
PF		PM
1.	AUTOPILOT – DISCONNECT (A large out of trim condition could be encountered when the AP is disconnected.)	MONITOR airspeed and attitude throughout the recovery and ANNOUNCE any continued divergence
2.	AUTOTHRUST/AUTOTHROTTLE – OFF	
3.	RECOVERY from stall if required	
4.	ROLL in the shortest direction to wings level. (It may be necessary to reduce the g-loading by applying forward control pressure to improve roll effectiveness)	
5.	THRUST and DRAG – ADJUST (if required)	
6.	RECOVER to level flight. (Avoid the secondary stall due premature recovery or excessive g-loading.)	
NOTE:		
1)	Recovery to level flight may require use of pitch trim.	
2)	WARNING: Excessive use of pitch trim or rudder may aggravate the upset situation or may result in high structural loads.	

GM4 ORO.FC.220&230 Operator conversion training and checking & recurrent training and checking

ED Decision 2015/012/R

(deleted)

GM5 ORO.FC.220&230 Operator conversion training and checking & recurrent training and checking

ED Decision 2019/005/R

PERSONNEL PROVIDING FSTD UPSET PREVENTION AND RECOVERY TRAINING (UPRT)

It is of paramount importance that personnel providing UPRT in FSTDs have the specific competence to deliver such training, which may not have been demonstrated during previous instructor qualification training. Operators should, therefore, have a comprehensive training and standardisation programme in place, and may need to provide FSTD instructors with additional training to ensure such instructors have and maintain complete knowledge and understanding of the UPRT operating environment, and skill sets.

Standardisation and training should ensure that personnel providing FSTD UPRT:

- (1) are able to demonstrate the correct upset recovery techniques for the specific aeroplane type;
- (2) understand the importance of applying type-specific Original Equipment Manufacturers (OEMs) procedures for recovery manoeuvres;
- (3) are able to distinguish between the applicable SOPs and the OEMs recommendations (if available);
- (4) understand the capabilities and limitations of the FSTD used for UPRT, based on the applicable FSTD training envelope;

- (5) are aware of the potential of negative transfer of training that may exist when training outside the capabilities of the FSTD;
- (6) understand and are able to use the IOS of the FSTD in the context of effective UPRT delivery;
- (7) understand and are able to use the FSTD instructor tools available for providing accurate feedback on flight crew performance;
- (8) understand the importance of adhering to the FSTD UPRT scenarios that have been validated by the training programme developer; and
- (9) understand the missing critical human factor aspects due to the limitations of the FSTD and convey this to the flight crew receiving the training.

ORO.FC.230 Recurrent training and checking

Regulation (EU) 2021/2237

- (a) **Each flight crew member shall complete recurrent training and checking relevant to the type or variant, and associated equipment of aircraft on which they operate.**
- (b) **Operator proficiency check**
 - (1) Each flight crew member shall complete operator proficiency checks as part of the normal crew complement.
 - (2) When the flight crew member will be required to operate under IFR, the operator proficiency check shall be conducted without external visual reference, as appropriate.
 - (3) The validity period of the operator proficiency check shall be 6 calendar months. For operations under VFR by day of performance class B aeroplanes that are conducted during seasons not longer than 8 consecutive months, one operator proficiency check shall be sufficient. The proficiency check shall be undertaken before commencing CAT operations.
- (c) **Line check**

Each flight crew member shall complete a line check on the aircraft. The validity period of the line check shall be 12 calendar months.
- (d) **Emergency and safety equipment training and checking**

Each flight crew member shall complete recurrent training and checking on the location and use of all emergency and safety equipment carried on board the aircraft. The validity period of an emergency and safety equipment training and checking shall be 12 calendar months.
- (e) **CRM training**
 - (1) Elements of CRM shall be integrated into all appropriate phases of the recurrent training.
 - (2) Each flight crew member shall undergo specific modular CRM training. All major topics of CRM training shall be covered by distributing modular training sessions as evenly as possible over each 3-year period.
- (f) **Each flight crew member shall undergo ground training and flight training in an FSTD or an aircraft, or a combination of FSTD and aircraft training, at least every 12 calendar months.**

AMC1 ORO.FC.230 Recurrent training and checking

ED Decision 2016/019/R

RECURRENT TRAINING SYLLABUS**(a) Recurrent training**

Recurrent training should comprise the following:

(1) Ground training**(i) The ground training programme should include:**

- (A)** aircraft systems;
- (B)** operational procedures and requirements, including ground de-icing/anti-icing and pilot incapacitation; and
- (C)** accident/incident and occurrence review.

(ii) Knowledge of the ground training should be verified by a questionnaire or other suitable methods.**(iii) When the ground training is conducted within 3 calendar months prior to the expiry of the 12 calendar months period, the next ground and refresher training should be completed within 12 calendar months of the original expiry date of the previous training.****(2) Emergency and safety equipment training****(i) Emergency and safety equipment training may be combined with emergency and safety equipment checking and should be conducted in an aircraft or a suitable alternative training device.****(ii) Every year the emergency and safety equipment training programme should include the following:**

- (A)** actual donning of a life-jacket, where fitted;
- (B)** actual donning of protective breathing equipment, where fitted;
- (C)** actual handling of fire extinguishers of the type used;
- (D)** instruction on the location and use of all emergency and safety equipment carried on the aircraft;
- (E)** instruction on the location and use of all types of exits;
- (F)** security procedures.

(iii) Every 3 years the programme of training should include the following:

- (A)** actual operation of all types of exits;
- (B)** demonstration of the method used to operate a slide where fitted;
- (C)** actual fire-fighting using equipment representative of that carried in the aircraft on an actual or simulated fire except that, with Halon extinguishers, an alternative extinguisher may be used;
- (D)** the effects of smoke in an enclosed area and actual use of all relevant equipment in a simulated smoke-filled environment;
- (E)** actual handling of pyrotechnics, real or simulated, where applicable;

- (F) demonstration in the use of the life-rafts where fitted. In the case of helicopters involved in extended over water operations, demonstration and use of the life-rafts.

Helicopter water survival training

Where life-rafts are fitted for helicopter extended overwater operations (such as sea pilot transfer, offshore operations, regular, or scheduled, coast-to-coast overwater operations), a comprehensive wet drill to cover all ditching procedures should be practised by aircraft crew. This wet drill should include, as appropriate, practice of the actual donning and inflation of a life-jacket, together with a demonstration or audio-visual presentation of the inflation of life-rafts. Crews should board the same (or similar) life-rafts from the water whilst wearing a life-jacket. Training should include the use of all survival equipment carried on board life-rafts and any additional survival equipment carried separately on board the aircraft;

consideration should be given to the provision of further specialist training such as underwater escape training. Where operations are predominately conducted offshore, operators should conduct 3-yearly helicopter underwater escape training at an appropriate facility;

wet practice drill should always be given in initial training unless the crew member concerned has received similar training provided by another operator;

- (G) particularly in the case where no cabin crew is required, first-aid, appropriate to the aircraft type, the kind of operation and crew complement.

- (iv) The successful resolution of aircraft emergencies requires interaction between flight crew and cabin/technical crew and emphasis should be placed on the importance of effective coordination and two-way communication between all crew members in various emergency situations.
- (v) Emergency and safety equipment training should include joint practice in aircraft evacuations so that all who are involved are aware of the duties other crew members should perform. When such practice is not possible, combined flight crew and cabin/technical crew training should include joint discussion of emergency scenarios.
- (vi) Emergency and safety equipment training should, as far as practicable, take place in conjunction with cabin/technical crew undergoing similar training with emphasis on coordinated procedures and two-way communication between the flight crew compartment and the cabin.

(3) CRM

Elements of CRM training, as specified in Table 1 of [AMC1 ORO.FC.115](#), should be integrated into all appropriate phases of recurrent training.

-
- (4) Aircraft/FSTD training
- (i) General
- (A) The aircraft/FSTD training programme should be established in a way that all major failures of aircraft systems and associated procedures will have been covered in the preceding 3 year period.
 - (B) When engine-out manoeuvres are carried out in an aircraft, the engine failure should be simulated.
 - (C) Aircraft/FSTD training may be combined with the operator proficiency check.
 - (D) When the aircraft/FSTD training is conducted within 3 calendar months prior to the expiry of the 12 calendar months period, the next aircraft/FSTD training should be completed within 12 calendar months of the original expiry date of the previous training.
- (ii) Helicopters
- (A) Where a suitable FSTD is available, it should be used for the aircraft/FSTD training programme. If the operator is able to demonstrate, on the basis of a compliance and risk assessment, that using an aircraft for this training provides equivalent standards of training with safety levels similar to those achieved using an FSTD, the aircraft may be used for this training to the extent necessary.
 - (B) The recurrent training should include the following additional items, which should be completed in an FSTD:
 - settling with power and vortex ring;
 - loss of tail rotor effectiveness.
- (5) For operations with other-than-complex motor-powered aeroplanes, all training and checking should be relevant to the type of operation and class of aeroplane on which the flight crew member operates with due account taken of any specialised equipment used.
- (b) Recurrent checking
- Recurrent checking should comprise the following:
- (1) Operator proficiency checks
- (i) Aeroplanes
- Where applicable, operator proficiency checks should include the following manoeuvres as pilot flying:
- (A) rejected take-off when an FSTD is available to represent that specific aeroplane, otherwise touch drills only;
 - (B) take-off with engine failure between V_1 and V_2 (take-off safety speed) or, if carried out in an aeroplane, at a safe speed above V_2 ;
 - (C) 3D approach operation to minima with, in the case of multi-engine aeroplanes, one-engine-inoperative;
 - (D) 2D approach operation to minima;

- (E) at least one of the 3D or 2D approach operations should be an RNP APCH or RNP AR APCH operation;
 - (F) missed approach on instruments from minima with, in the case of multi-engined aeroplanes, one-engine-inoperative;
 - (G) landing with one-engine-inoperative. For single-engine aeroplanes a practice forced landing is required.
- (ii) Helicopters
- (A) Where applicable, operator proficiency checks should include the following abnormal/emergency procedures:
 - engine fire;
 - fuselage fire;
 - emergency operation of under carriage;
 - fuel dumping;
 - engine failure and relight;
 - hydraulic failure;
 - electrical failure;
 - engine failure during take-off before decision point;
 - engine failure during take-off after decision point;
 - engine failure during landing before decision point;
 - engine failure during landing after decision point;
 - flight and engine control system malfunctions;
 - recovery from unusual attitudes;
 - landing with one or more engine(s) inoperative;
 - instrument meteorological conditions (IMC) autorotation techniques;
 - autorotation to a designated area;
 - pilot incapacitation;
 - directional control failures and malfunctions.
 - (B) For pilots required to engage in IFR operations, proficiency checks include the following additional abnormal/emergency procedures:
 - 3D approach operation to minima;
 - go-around on instruments from minima with, in the case of multi-engined helicopters, a simulated failure of one engine;
 - 2D approach operation to minima;
 - at least one of the 3D or 2D approach operations should be an RNP APCH or RNP AR APCH operation;
 - in the case of multi-engined helicopters, a simulated failure of one engine to be included in either the 3D or 2D approach operation to minima;

- landing with a simulated failure of one or more engines;
 - where appropriate to the helicopter type, approach with flight control system/flight director system malfunctions, flight instrument and navigation equipment failures.
- (C) Before a flight crew member without a valid instrument rating is allowed to operate in VMC at night, he/she should be required to undergo a proficiency check at night. Thereafter, each second proficiency check should be conducted at night.
- (iii) Once every 12 months the checks prescribed in (b)(1)(ii)(A) may be combined with the proficiency check for revalidation or renewal of the aircraft type rating.
- (iv) Operator proficiency checks should be conducted by a type rating examiner (TRE) or a synthetic flight examiner (SFE), as applicable.
- (2) Emergency and safety equipment checks
- The items to be checked should be those for which training has been carried out in accordance with (a)(2).
- (3) Line checks
- (i) Line checks should establish the ability to perform satisfactorily a complete line operation, including pre-flight and post-flight procedures and use of the equipment provided, as specified in the operations manual. The route chosen should be such as to give adequate representation of the scope of a pilot's normal operations. When weather conditions preclude a manual landing, an automatic landing is acceptable. The commander, or any pilot who may be required to relieve the commander, should also demonstrate his/her ability to 'manage' the operation and take appropriate command decisions.
 - (ii) The flight crew should be assessed on their CRM skills in accordance with the methodology described in [AMC1 ORO.FC.115](#) and as specified in the operations manual.
 - (iii) CRM assessment should not be used as a reason for a failure of the line check, unless the observed behaviour could lead to an unacceptable reduction in safety margin.
 - (iv) When pilots are assigned duties as pilot flying and pilot monitoring, they should be checked in both functions.
 - (v) Line checks should be conducted by a commander nominated by the operator. The operator should inform the competent authority about the persons nominated. The person conducting the line check should occupy an observer's seat where installed. His/her CRM assessments should solely be based on observations made during the initial briefing, cabin briefing, flight crew compartment briefing and those phases where he/she occupies the observer's seat.
 - (A) For aeroplanes, in the case of long haul operations where additional operating flight crew are carried, the person may fulfil the function of a cruise relief pilot and should not occupy either pilot's seat during take-off, departure, initial cruise, descent, approach and landing.
 - (vi) Where a pilot is required to operate as pilot flying and pilot monitoring, he/she should be checked on one flight sector as pilot flying and on another flight sector

as pilot monitoring. However, where the operator's procedures require integrated flight preparation, integrated cockpit initialisation and that each pilot performs both flying and monitoring duties on the same sector, then the line check may be performed on a single flight sector.

- (4) When the operator proficiency check, line check or emergency and safety equipment check are undertaken within the final 3 calendar months of validity of a previous check, the period of validity of the subsequent check should be counted from the expiry date of the previous check.
 - (5) In the case of single-pilot operations with helicopters, the recurrent checks referred to in (b)(1), (2) and (3) should be performed in the single-pilot role on a particular helicopter type in an environment representative of the operation.
- (c) Flight crew incapacitation training, except single-pilot operations
- (1) Procedures should be established to train flight crew to recognise and handle flight crew incapacitation. This training should be conducted every year and can form part of other recurrent training. It should take the form of classroom instruction, discussion, audio-visual presentation or other similar means.
 - (2) If an FSTD is available for the type of aircraft operated, practical training on flight crew incapacitation should be carried out at intervals not exceeding 3 years.
- (d) Personnel providing training and checking
- Training and checking should be provided by the following personnel:
- (1) ground and refresher training by suitably qualified personnel;
 - (2) flight training by a flight instructor (FI), type rating instructor (TRI) or class rating instructor (CRI) or, in the case of the FSTD content, a synthetic flight instructor (SFI), providing that the FI, TRI, CRI or SFI satisfies the operator's experience and knowledge requirements sufficient to instruct on the items specified in paragraphs (a)(1)(i)(A) and (B);
 - (3) emergency and safety equipment training by suitably qualified personnel;
 - (4) CRM:
 - (i) integration of CRM elements into all the phases of the recurrent training by all the personnel conducting recurrent training. The operator should ensure that all personnel conducting recurrent training are suitably qualified to integrate elements of CRM into this training;
 - (ii) classroom CRM training by at least one CRM trainer, qualified as specified in [AMC3 ORO.FC.115](#) who may be assisted by experts in order to address specific areas.
 - (5) recurrent checking by the following personnel:
 - (i) operator proficiency check by a type rating examiner (TRE), class rating examiner (CRE) or, if the check is conducted in an FSTD, a TRE, CRE or a synthetic flight examiner (SFE), trained in CRM concepts and the assessment of CRM skills.
 - (ii) emergency and safety equipment checking by suitably qualified personnel.

(e) Use of FSTD

- (1) Training and checking provide an opportunity to practice abnormal/emergency procedures that rarely arise in normal operations and should be part of a structured programme of recurrent training. This should be carried out in an FSTD whenever possible.
- (2) The line check should be performed in the aircraft. All other training and checking should be performed in an FSTD, or, if it is not reasonably practicable to gain access to such devices, in an aircraft of the same type or in the case of emergency and safety equipment training, in a representative training device. The type of equipment used for training and checking should be representative of the instrumentation, equipment and layout of the aircraft type operated by the flight crew member.
- (3) Because of the unacceptable risk when simulating emergencies such as engine failure, icing problems, certain types of engine(s) (e.g. during continued take-off or go-around, total hydraulic failure), or because of environmental considerations associated with some emergencies (e.g. fuel dumping) these emergencies should preferably be covered in an FSTD. If no FSTD is available, these emergencies may be covered in the aircraft using a safe airborne simulation, bearing in mind the effect of any subsequent failure, and the exercise must be preceded by a comprehensive briefing.

[AMC1 ORO.FC.230 applicable until 25 March 2023 — ED Decision 2022/014/R]

AMC1 ORO.FC.230 Recurrent training and checking

ED Decision 2022/014/R

RECURRENT TRAINING AND CHECKING SYLLABUS

(a) Recurrent training

Recurrent training should comprise the following:

- (1) Ground training
 - (i) The ground training programme should include:
 - (A) aircraft systems;
 - (B) normal procedures, which include flight planning and ground-handling and flight operations, including performance, mass and balance, fuel schemes, selection of alternates, and ground de-icing/anti-icing;
 - (C) abnormal and emergency procedures, which include pilot incapacitation as applicable;
 - (D) a review of relevant samples of accident/incident and occurrences to increase awareness of the occurrences that may be relevant for the intended operation.
 - (ii) Knowledge of the ground training should be verified by a questionnaire or other suitable methods.
- (2) Emergency and safety equipment training
 - (i) Emergency and safety equipment training may be combined with emergency and safety equipment checking and should be conducted in an aircraft or a suitable alternative training device.

- (ii) Every year the emergency and safety equipment training programme should include the following:
 - (A) actual donning of a life-jacket, where fitted;
 - (B) actual donning of protective breathing equipment, where fitted;
 - (C) actual handling of fire extinguishers of the type used;
 - (D) instruction on the location and use of all emergency and safety equipment carried on the aircraft;
 - (E) instruction on the location and use of all types of exits;
 - (F) security procedures.
- (iii) Every 3 years the programme of training should include the following:
 - (A) actual operation of all types of exits;
 - (B) demonstration of the method used to operate a slide where fitted;
 - (C) actual fire-fighting using equipment representative of that carried in the aircraft on an actual or simulated fire except that, with Halon extinguishers, an alternative extinguisher may be used;
 - (D) the effects of smoke in an enclosed area and actual use of all relevant equipment in a simulated smoke-filled environment;
 - (E) actual handling of pyrotechnics, real or simulated, where applicable;
 - (F) demonstration in the use of the life-rafts where fitted. In the case of helicopters involved in extended over water operations, demonstration and use of the life-rafts.

Helicopter water survival training

Where life-rafts are fitted for helicopter extended overwater operations (such as sea pilot transfer, offshore operations, regular, or scheduled, coast-to-coast overwater operations), a comprehensive wet drill to cover all ditching procedures should be practised by aircraft crew. This wet drill should include, as appropriate, practice of the actual donning and inflation of a life-jacket, together with a demonstration or audio-visual presentation of the inflation of life-rafts. Crews should board the same (or similar) life-rafts from the water whilst wearing a life-jacket. Training should include the use of all survival equipment carried on board life-rafts and any additional survival equipment carried separately on board the aircraft;

- consideration should be given to the provision of further specialist training such as underwater escape training. Where operations are predominately conducted offshore, operators should conduct 3-yearly helicopter underwater escape training at an appropriate facility;
- wet practice drill should always be given in initial training unless the crew member concerned has received similar training provided by another operator;

- (G) particularly in the case where no cabin crew is required, first-aid, appropriate to the aircraft type, the kind of operation and crew complement.
 - (iv) The successful resolution of aircraft emergencies requires interaction between flight crew and cabin/technical crew and emphasis should be placed on the importance of effective coordination and two-way communication between all crew members in various emergency situations.
 - (v) Emergency and safety equipment training should include joint practice in aircraft evacuations so that all who are involved are aware of the duties other crew members should perform. When such practice is not possible, combined flight crew and cabin/technical crew training should include joint discussion of emergency scenarios.
 - (vi) Emergency and safety equipment training should, as far as practicable, take place in conjunction with cabin/technical crew undergoing similar training with emphasis on coordinated procedures and two-way communication between the flight crew compartment and the cabin.
- (3) CRM
- Elements of CRM training, as specified in Table 1 of [AMC1 ORO.FC.115](#), should be integrated into all appropriate phases of recurrent training.
- (4) Aircraft/FSTD training
- (i) General
 - (A) The aircraft/FSTD training programme should be established in a way that all major failures of aircraft systems and associated procedures will have been trained in the preceding 3-year period.
 - (B) When engine-out manoeuvres are carried out in an aircraft, the engine failure should be simulated.
 - (C) The recurrent aircraft/FSTD training of a single task or manoeuvre should be separate from, and should not take place at the same time as, an operator proficiency check of the item.
 - (ii) Helicopters
 - (A) If the operator is able to demonstrate, on the basis of a compliance and risk assessment, that alternating the use of an FSTD with the use of an aircraft for this training provides equivalent standards of training with safety levels similar to those achieved using an FSTD, the aircraft may be used (alternating with the use of an FSTD) for this training to the extent necessary.
 - (B) Where a suitable FSTD is available and accessible, it should be used to complete the following additional items:
 - settling with power and vortex ring;
 - loss of tail rotor effectiveness.
- (5) For operations with other-than-complex motor-powered aeroplanes, all training and checking should be relevant to the type of operation and class of aeroplane on which the flight crew member operates with due account taken of any specialised equipment used.

(b) Recurrent checking

Recurrent checking should comprise the following:

(1) Operator proficiency checks

(i) Aeroplanes

Operator proficiency checks should take place as part of the normal crew complement and should include, where applicable, the following manoeuvres as pilot flying:

- (A) rejected take-off when an FSTD is available to represent that specific aeroplane, otherwise touch drills only;
- (B) take-off with engine failure between V1 and V2 (take-off safety speed) or, if carried out in an aeroplane, at a safe speed above V2;
- (C) 3D approach operation to minima with, in the case of multi-engined aeroplanes, one-engine-inoperative;
- (D) 2D approach operation to minima;
- (E) at least one of the 3D or 2D approach operations should be an RNP APCH or RNP AR APCH operation;
- (F) missed approach on instruments from minima with, in the case of multi-engined aeroplanes, one-engine-inoperative;
- (G) landing with one-engine-inoperative. For single-engined aeroplanes, a practice forced landing is required.

(ii) Helicopters

- (A) The aircraft/FSTD checking programme should be established in a way that all major failures of aircraft systems and associated procedures will have been checked in the preceding 3-year period.

The operator should define which failures are major for the purpose of the operator proficiency check based on a risk assessment, taking the following into account:

- (a) cautions or warnings associated with the failure;
- (b) the criticality of the situation or failure;
- (c) the outcome of the procedure (land immediately or as soon as possible as opposed to land as soon as practical);
- (d) when available, manufacturer documentation; and
- (e) the list of abnormal/emergency procedures described in [point \(e\)\(1\) of AMC1 ORO.FC.220](#).

In addition, for single-engined helicopters, each operator proficiency check should include at least the following procedures:

- (f) engine failure;
- (g) directional control failures and malfunctions; and
- (h) hydraulic failure as applicable.

- (B) When a group of single-engine turbine or single-engine piston helicopter types is defined for the purpose of extending the validity of the operator proficiency check, all major system failures should nevertheless be checked on every type within a 3-year cycle unless credits related to the training, checking and recent experience requirements are defined in the operational suitability data established in accordance with [Commission Regulation \(EU\) No 748/2012](#) for the relevant types or variants.
 - (C) For pilots required to engage in IFR operations, proficiency checks include the following additional normal/abnormal/emergency procedures:
 - 3D approach operation to minima;
 - go-around on instruments;
 - 2D approach operation to minima;
 - if relevant, at least one of the 3D or 2D approach operations should be an RNP APCH or RNP AR APCH operation;
 - in the case of multi-engined helicopters, a simulated failure of one engine to be included in either the 3D or 2D approach operation to minima;
 - where appropriate to the helicopter type, approach with flight control system/flight director system malfunctions, flight instrument and navigation equipment failures.
 - (D) Before a flight crew member without a valid instrument rating is allowed to operate in VMC at night, they should be required to undergo a proficiency check at night. Thereafter, each second proficiency check should be conducted at night.
 - (E) Operator proficiency checks should be conducted with two qualified pilots in multi-pilot operations, and one qualified pilot in single-pilot operations. A pilot flying both single-pilot and multi-pilot operations should be checked in multi-pilot conditions with the essential malfunctions or manoeuvres below being also checked in the single-pilot role:
 - (a) at least two abnormal or emergency manoeuvres relevant to the type based on a risk assessment;
 - (b) one instrument approach for IFR operations.
 - (F) The flight crew should be assessed on their CRM skills in accordance with the methodology described in [AMC1](#) and [AMC2 ORO.FC.115](#) and as specified in the operations manual.
 - (G) If the operator is able to demonstrate, on the basis of a compliance and risk assessment, that alternating the use of an FSTD with the use of an aircraft for this training provides equivalent standards of checking with safety levels similar to those achieved using an FSTD, the aircraft may be used (alternating with the use of an FSTD) for this checking to the extent necessary.
- (iii) The checks prescribed in (b)(1) may be combined with the skill test or proficiency check required for the issue, the revalidation or renewal of the aircraft type rating and with the skill test required for the issue of the ATPL licence.

(2) Emergency and safety equipment checks

The items to be checked should be those for which training has been carried out in accordance with (a)(2).

(3) Line checks

- (i) A line check should establish the ability to perform satisfactorily a complete line operation, including pre-flight and post-flight procedures and use of the equipment provided, as specified in the operations manual. The route chosen should be such as to give adequate representation of the scope of a pilot's normal operations. When weather conditions preclude a manual landing, an automatic landing is acceptable. The commander, or any pilot who may be required to relieve the commander, should also demonstrate their ability to 'manage' the operation and take appropriate command decisions.
- (ii) The flight crew should be assessed on their CRM skills in accordance with the methodology described in [AMC1 ORO.FC.115](#) and as specified in the operations manual.
- (iii) CRM assessment should not be used as a reason for a failure of the line check, unless the observed behaviour could lead to an unacceptable reduction in safety margin.
- (iv) When pilots are assigned duties as pilot flying and pilot monitoring, they should be checked in both functions.
- (v) A line check should be conducted by a commander nominated by the operator. The operator should maintain a list of nominated commanders and inform the competent authority about the persons nominated. The person conducting the line check should occupy an observer's seat where installed.
 - (A) For aeroplanes, in the case of long-haul operations where additional operating flight crew are carried, the person conducting the line check may fulfil the function of a cruise relief pilot and should not occupy either pilot's seat during take-off, departure, initial cruise, descent, approach and landing.
 - (B) If an observer's seat is not installed but a forward-facing passenger seat allows a good view and sound of the cockpit and the crew, this seat should be used as an observer's seat.
 - (C) If an observer's seat is not available and cannot be installed, the commander nominated by the operator should occupy a pilot seat to conduct the line check.
- (vi) CRM assessment during the line check
 - (A) The CRM assessment taking place during the line check should be solely based on observations made during the initial briefing, cabin briefing, flight crew compartment briefing and those phases where the line checker occupies the observer's seat.
 - (B) If an observer's seat is not available and cannot be installed, then the operator should define the best way to assess CRM taking into account the CRM principles above.

- (vii) Complementary CRM assessment

If a suitable FSTD is available and accessible for operator proficiency checks or FSTD training, then a CRM assessment should take place in a line-oriented flight scenario (LOFT or line-oriented section of the OPC) of an FSTD session. This assessment complements the CRM assessment taking place during the line check, but is not part of the line check.
- (viii) Where a pilot is required to operate as pilot flying and pilot monitoring, they should be checked on one flight sector as pilot flying and on another flight sector as pilot monitoring.
- (4) In the case of single-pilot operations, the recurrent checks referred to in (b)(1) and (3) should be performed in the single-pilot role in an environment representative of the operation.
- (c) Flight crew incapacitation training, except single-pilot operations
 - (1) Procedures should be established to train flight crew to recognise and handle flight crew incapacitation. This training should be conducted every year and can form part of other recurrent training. It should take the form of classroom instruction, discussion, audio-visual presentation or other similar means.
 - (2) If an FSTD is available for the type of aircraft operated, practical training on flight crew incapacitation should be carried out at intervals not exceeding 3 years.
- (d) Use of FSTD
 - (1) Training and checking provide an opportunity to practise abnormal/emergency procedures that rarely arise in normal operations and should be part of a structured programme of recurrent training. This should be carried out in an FSTD when available and accessible.
 - (2) The line check should be performed in the aircraft. All other training and checking should be performed in an FSTD, or, if it is not reasonably practicable to gain access to such devices, in an aircraft of the same type or in the case of emergency and safety equipment training, in a representative training device. The type of equipment used for training and checking should be representative of the instrumentation, equipment and layout of the aircraft type operated by the flight crew member.
 - (3) Because of the unacceptable risk when simulating emergencies such as engine failure, icing problems, certain types of engine(s) (e.g. during continued take-off or go-around, total hydraulic failure), or because of environmental considerations associated with some emergencies (e.g. fuel dumping) these emergencies should preferably be covered in an FSTD. If no FSTD is available, these emergencies may be covered in the aircraft using a safe airborne simulation, bearing in mind the effect of any subsequent failure, and the exercise must be preceded by a comprehensive briefing.

[AMC1 ORO.FC.230 applicable from 26 March 2023]

AMC2 ORO.FC.230 Recurrent training and checking

ED Decision 2014/017/R

FLIGHT ENGINEERS

- (a) The recurrent training and checking for flight engineers should meet the requirements for pilots and any additional specific duties, omitting those items that do not apply to flight engineers.

- (b) Recurrent training and checking for flight engineers should, whenever possible, take place concurrently with a pilot undergoing recurrent training and checking.
- (c) The line check should be conducted by a commander or by a flight engineer nominated by the operator, in accordance with national rules, if applicable.

AMC3 ORO.FC.230 Recurrent training and checking

ED Decision 2022/014/R

TRAINING PROGRAMMES

The operator should ensure that training programmes include the relevant de-identified feedback from the management system, including occurrence reporting and flight data monitoring programmes.

[applicable from 26 March 2023]

GM1 ORO.FC.230 Recurrent training and checking

ED Decision 2014/017/R

LINE CHECK AND PROFICIENCY TRAINING AND CHECKING

- (a) Line checks, route and aerodrome knowledge and recent experience requirements are intended to ensure the crew member's ability to operate efficiently under normal conditions, whereas other checks and emergency and safety equipment training are primarily intended to prepare the crew member for abnormal/emergency procedures.
- (b) The line check is considered a particularly important factor in the development, maintenance and refinement of high operating standards, and can provide the operator with a valuable indication of the usefulness of his/her training policy and methods. Line checks are a test of a flight crew member's ability to perform a complete line operation, including pre-flight and post-flight procedures and use of the equipment provided, and an opportunity for an overall assessment of his/her ability to perform the duties required as specified in the operations manual. The line check is not intended to determine knowledge on any particular route.

[point (b) applicable until 25 March 2023 — ED Decision 2022/014/R]

- (b) The line check is considered a particularly important factor in the development, maintenance and refinement of high operating standards, and can provide the operator with a valuable indication of the usefulness of its training policy and methods. Line checks are a test of a flight crew member's ability to perform a complete line operation, including pre-flight and post-flight procedures and use of the equipment provided, and an opportunity for an overall assessment of their ability to perform the duties required as specified in the operations manual. The line check is not intended to determine knowledge on any particular route.

[point (b) applicable from 26 March 2023 — ED Decision 2022/014/R]

- (c) Proficiency training and checking

When an FSTD is used, the opportunity should be taken, where possible, to use LOFT.

MAJOR FAILURES — HELICOPTERS

- (d) The list of major failures as defined by the operator in [AMC1 ORO.FC.230](#) for the purpose of training may be more extensive than the list covered in the 3-yearly operator proficiency checking programme for the following reasons:
 - (1) It may happen that several training elements are covered by a single check; and

- (2) Certain complex system malfunctions are best explored under recurrent training, where the trainee will derive more benefit and training to proficiency is also employed.

[point (d) applicable from 26 March 2023 — ED Decision 2022/014/R]

GM1 ORO.FC.230(a);(b);(f) Recurrent training and checking

ED Decision 2021/002/R

MIXED EVIDENCE-BASED RECURRENT TRAINING AND CHECKING OF FLIGHT CREW CONDUCTED IN FLIGHT SIMULATION TRAINING DEVICES (FSTDs)

ICAO has developed Doc 9995 'Manual of Evidence-based Training', followed by the EASA EBT manual, which is intended to provide guidance to the competent authorities, operators and approved training organisations on the recurrent assessment and training of pilots by establishing a new methodology for the development and conduct of a recurrent assessment and training programme, titled evidence-based training (EBT).

ICAO Doc 9995 and the EASA EBT manual are the reference documents for operators seeking to implement mixed EBT. The purpose of this guidance material (GM) is to enable the implementation of mixed EBT according to the principles established in ICAO Doc 9995 and the EASA EBT manual in the context of the European regulatory framework.

In the current regulatory framework, it is possible to achieve mixed EBT implementation. Implementation of a mixed EBT programme means that some portion of the recurrent assessment and training is dedicated to the application of EBT. This includes the licence proficiency check (LPC) and the operator proficiency check (OPC).

As it is possible to combine LPC and OPC in ORO.FC, this GM is applicable to both checks. Therefore, the EBT programme described in this GM refers to the recurrent training and checking of flight crew, including LPCs and OPCs.

The EBT programme takes into account the differences between aircraft of different generations and the effect of these differences on training. The operator should acquire a thorough knowledge of ICAO Doc 9995 or the EASA EBT manual before implementing this GM. For applicability, see ICAO Doc 9995 or the EASA tables of applicable aeroplane/helicopter types by generation.

Mixed EBT programme

The operator may undertake implementation of the mixed EBT programme according to this GM. The ICAO table of assessment and training topics is defined in ICAO Doc 9995 Chapter 4.3.1 and in Appendices 2 to 7; the EASA EBT programme is defined in [AMC2 to AMC7 to ORO.FC.232](#).

The mixed EBT programme provides operators with the flexibility to adapt programmes according to their specific risks.

The operator should contact the competent authority in order for them to assess the application of the process described in ICAO Doc 9995 or the EBT manual.

Personnel providing training and checking in EBT (Refers to [AMC1 ORO.FC.230\(d\)](#))

ICAO Doc 9995 Chapter 6, or EASA [AMC1](#) and [AMC2 to ORO.FC.146\(c\)](#), contain(s) the guidance for the assessment and training of personnel involved in the conduct of EBT.

Equivalency of malfunctions (Refers to ICAO Doc 9995 Paragraph 3.8.3)

According to the concept of EASA and ICAO Doc 9995 Chapter 3.8.3, major failures reduce the capability of the aircraft or the ability of the crew to cope with operating conditions to the extent that

there would be a significant reduction in functional capabilities, significant increase in crew workload or in conditions impairing crew efficiency.

Clusters of major failures of aircraft systems are determined by reference to malfunction characteristics and the underlying elements of crew performance required to manage them. Equivalency of malfunctions may be used to guide the operator towards the implementation of a mixed EBT programme according to [AMC1 ORO.FC.230\(a\)\(4\)\(i\)\(A\)](#) and [ORO.FC.145\(d\)](#).

Conduct of licence and operator proficiency checks

The EASA EBT programme described in [ORO.FC.231](#) and the ICAO EBT programme described in ICAO Doc 9995 contains modules with three phases: the EVAL, the MT, and the SBT. In order to comply with the regulatory framework, in the mixed EBT programme the LPC and OPC requirements are fulfilled by a combination of the EVAL and the manoeuvres validation phase, which replaces the MT described in the EASA EBT programme or ICAO Doc 9995. The manoeuvres validation phase is defined in Section 2 below. This is a form of mixed EBT implementation, which is described as follows:

1. **Evaluation phase:** This includes check scenarios referred to in Part-FCL Appendix 9 within an approved mixed EBT programme.

In order to facilitate the provision of simple and realistic scenarios in accordance with ICAO Doc 9995 Chapters 3.8 and 7.4, the EVAL is not intended to be a comprehensive assessment of all Part-FCL Appendix 9 items; nevertheless, the list below includes the items that should be included in the EVAL only.

		Part-FCL or Part-ORO reference	Description
A E R O P L A N E S	H E L I C O P T E R S	Part-FCL Appendix 9 Paragraph 6	The examiner may choose between different skill test or proficiency check scenarios containing simulated relevant operations developed and approved by the competent authority. Full-flight simulators and other training devices, when available, shall be used, as established in this Part.
		Part-FCL Appendix 9 Paragraph 16 of section B	The test or check should be accomplished under instrument flight rules (IFRs), if instrument rating (IR) is included, and as far as possible be accomplished in a simulated commercial air transport environment. An essential element to be checked is the ability to plan and conduct the flight from routine briefing material.
		Part-FCL Appendix 9 Item 1.4	Use of checklist prior to starting engines, starting procedures, radio and navigation equipment check, selection and setting of navigation and communication frequencies.
		Part-FCL Appendix 9 Item 1.6	Before take-off checks.
		Part-FCL Appendix 9 Item 3.8.1*	Adherence to departure and arrival routes and ATC instructions. The starred item (*) shall be flown solely by reference to instruments. If this condition is not met during the skill

		test or proficiency check, the type rating will be restricted to VFR only.
H E L I C O P T E R S	Part-FCL Appendix 9 Paragraph 2 of section C	In case of proficiency check for an IR, the applicant shall pass section 5 of the proficiency check. Failure in more than three items will require the applicant to take the entire section 5 again. An applicant failing not more than three items shall take the failed items again. Failure in any item of the re-check or failure in any other items of section 5 already passed will require the applicant to take the entire check again.
	Part-FCL Appendix 9 Item 1.3.	Starting procedures, radio and navigation equipment check, selection and setting of navigation and communication frequencies
	Part-FCL Appendix 9 Item 1.4	Taxiing/air taxiing in compliance with air traffic control instructions or with instructions of an instructor
	Part-FCL Appendix 9 Item 1.5	Pre-take-off procedures and checks
	Part-FCL Appendix 9 Item 5.2*	Adherence to departure and arrival routes and ATC instructions The starred item (*) shall be flown solely by reference to instruments. If this condition is not met during the skill test or proficiency check, the type rating will be restricted to VFR only.

2. **Manoeuvres validation phase:** The purpose of the manoeuvres validation phase is to check the handling skills necessary to fly critical flight manoeuvres so that they are maintained to a defined level of proficiency. This replaces the MT described in ICAO Doc 9995 Chapter 7.5 and [ORO.FC.231\(a\)\(2\)\(iv\)\(B\)\(a\)](#). Manoeuvres in this context are not part of the line-orientated flight scenario; they are a sequence of deliberate actions to achieve a prescribed flight path or to perform a prescribed event to a prescribed outcome. All remaining items listed in Part-FCL Appendix 9, and not included in the EVAL, should be included here. The manoeuvres listed in Doc 9995 or the EASA table of assessment and training topics for the MT that do not form part of the Part-FCL Appendix 9 mandatory items may be trained after the manoeuvres validation phase.
3. **Scenario-based training phase:** The purpose of the SBT is to further develop pilot core competencies in a learning environment. This does not form part of any LPC or OPC requirement.

It should be noted that if the operator is following an alternative means of compliance to [ORO.FC.230\(b\)](#) Operator proficiency check, the equivalence of using EBT evaluation and manoeuvres validation phases may no longer exist.

Conduct of CRM assessment

The operator is advised to use the EBT grading system ([AMC1 ORO.FC.231\(d\)\(1\)](#)) and the EBT competencies ([AMC1 ORO.FC.231\(b\)](#)) for the non-technical skills assessment.

Additional guidance on mixed EBT implementation is available in the EASA checklist '[Oversight guidance for transition to Mixed EBT Implementation](#)'.

ORO.FC.231 Evidence-based training

Regulation (EU) 2020/2036

(a) EBT PROGRAMME

- (1) The operator may substitute the requirements of [ORO.FC.230](#) by establishing, implementing and maintaining a suitable EBT programme approved by the competent authority.

The operator shall demonstrate its capability to support the implementation of the EBT programme (including an implementation plan) and perform a safety risk assessment demonstrating how an equivalent level of safety is achieved.

(2) The EBT programme shall:

- (i) correspond to the size of the operator, and the nature and complexity of its activities, taking into account the hazards and associated risks inherent in those activities;
- (ii) ensure pilot competence by assessing and developing pilot competencies required for a safe, effective and efficient operation of aircraft;
- (iii) ensure that each pilot is exposed to the assessment and training topics derived in accordance with [ORO.FC.232](#);
- (iv) include at least six EBT modules distributed across a 3-year programme; each EBT module shall consist of an evaluation phase and a training phase. The validity period of a EBT module shall be 12 months;
 - (A) The evaluation phase comprises a line-orientated flight scenario (or scenarios) to assess all competencies and identify individual training needs.
 - (B) The training phase comprises:
 - (a) the manoeuvres training phase, comprising training to proficiency in certain defined manoeuvres;
 - (b) the scenario-based training phase, comprising a line-orientated flight scenario (or scenarios) to develop competencies and address individual training needs.

The training phase shall be conducted in a timely manner after the evaluation phase.

- (3) The operator shall ensure that each pilot enrolled in the EBT programme completes:
- (i) a minimum of two EBT modules within the validity period of the type rating, separated by a period of not less than 3 months. The EBT module is completed when:
 - (A) the content of the EBT programme is completed for that EBT module (exposure of the pilot to the assessment and training topics); and
 - (B) an acceptable level of performance in all observed competencies has been demonstrated;
 - (ii) line evaluation(s) of competence; and
 - (iii) ground training.

-
- (4) The operator shall establish an EBT instructor standardisation and concordance assurance programme to ensure that the instructors involved in EBT are properly qualified to perform their tasks.
- (i) All instructors must be subject to this programme;
 - (ii) The operator shall use appropriate methods and metrics to assess concordance;
 - (iii) The operator shall demonstrate that the instructors have sufficient concordance.
- (5) The EBT programme may include contingency procedures for unforeseen circumstances that could affect the delivery of the EBT modules. The operator shall demonstrate the need for those procedures. The procedures shall ensure that a pilot does not continue line operations if the performance observed was below the minimum acceptable level. They may include:
- (i) a different separation period between EBT modules; and
 - (ii) different order of the phases of the EBT module.
- (b) **COMPETENCY FRAMEWORK**
- The operator shall use a competency framework for all aspects of assessment and training within an EBT programme. The competency framework shall:
- (1) be comprehensive, accurate, and usable;
 - (2) include observable behaviours required for safe, effective and efficient operations;
 - (3) include a defined set of competencies, their descriptions and their associated observable behaviours.
- (c) **TRAINING SYSTEM PERFORMANCE**
- (1) The EBT system performance shall be measured and evaluated through a feedback process in order to:
 - (i) validate and refine the operator's EBT programme;
 - (ii) ascertain that the operator's EBT programme develops pilot competencies.
 - (2) The feedback process shall be included in the operator's management system.
 - (3) The operator shall develop procedures governing the protection of EBT data.
- (d) **GRADING SYSTEM**
- (1) The operator shall use a grading system to assess the pilot competencies. The grading system shall ensure:
 - (i) a sufficient level of detail to enable accurate and useful measurements of individual performance;
 - (ii) a performance criterion and a scale for each competency, with a point on the scale which determines the minimum acceptable level to be achieved for the conduct of line operations. The operator shall develop procedures to address low performance of the pilot;
 - (iii) data integrity;
 - (iv) data security.

-
- (2) The operator shall verify at regular intervals the accuracy of the grading system against a criterion-referenced system.
- (e) **SUITABLE TRAINING DEVICES AND VOLUME OF HOURS TO COMPLETE THE OPERATOR'S EBT PROGRAMME**
- (1) Each EBT module shall be conducted in an FSTD with a qualification level adequate to ensure the correct delivery of the assessment and training topics.
- (2) The operator shall provide a sufficient volume of hours in the suitable training device for the pilot to complete the operator's EBT programme. The criteria to determine the volume of the EBT programme are as follows:
- (i) The volume corresponds to the size and complexity of the EBT programme;
- (ii) The volume is sufficient to complete the EBT programme;
- (iii) The volume ensures an effective EBT programme taking into account the recommendations provided by ICAO, the Agency, and the competent authority;
- (iv) The volume corresponds to the technology of the training devices used.
- (f) **EQUIVALENCY OF MALFUNCTIONS**
- (1) Each pilot shall receive assessment and training in the management of aircraft system malfunctions.
- (2) Aircraft system malfunctions that place a significant demand on a proficient crew shall be organised by reference to the following characteristics:
- (i) immediacy;
- (ii) complexity;
- (iii) degradation of aircraft control;
- (iv) loss of instrumentation;
- (v) management of consequences.
- (3) Each pilot shall be exposed to at least one malfunction for each characteristic at the frequency determined by the table of assessment and training topics.
- (4) Demonstrated proficiency in the management of one malfunction is considered equivalent to demonstrated proficiency in the management of other malfunctions with the same characteristics.
- (g) **EQUIVALENCY OF APPROACHES RELEVANT TO OPERATIONS**
- (1) The operator shall ensure that each pilot receives regular training in the conduct of approach types and approach methods relevant to operations.
- (2) This training shall include approaches that place an additional demand on a proficient crew.
- (3) This training shall include the approaches that require specific approval in accordance with Annex V (Part-SPA) to this Regulation.
- (h) **LINE EVALUATION OF COMPETENCE**
- (1) Each pilot shall periodically undertake a line evaluation of competence in an aircraft to demonstrate the safe, effective and efficient conduct of normal line operations described in the operations manual.

- (2) The validity period of a line evaluation of competence shall be 12 months.
 - (3) The operator approved for EBT may, with the approval of the competent authority, extend the validity of the line evaluation of competence to:
 - (i) either 2 years, subject to a risk assessment;
 - (ii) or 3 years, subject to a feedback process for the monitoring of line operations which identifies threats to the operations, minimises the risks of such threats, and implements measures to manage human error in the operations.
 - (4) For successful completion of the line evaluation of competence, the pilot shall demonstrate an acceptable level of performance in all observed competencies.
- (i) GROUND TRAINING
- (1) Every 12 calendar months, each pilot shall undergo:
 - (i) technical ground training;
 - (ii) assessment and training on the location and use of all emergency and safety equipment carried on the aircraft.
 - (2) The operator may, with the approval of the competent authority and subject to a risk assessment, extend the period of assessment and training on the location and use of all emergency and safety equipment carried on the aircraft to 24 months.

AMC1 ORO.FC.231(a) Evidence-based training

ED Decision 2021/002/R

EBT PROGRAMME SUITABILITY

An operator's EBT programme is one in which:

- (a) training is focused on development of competencies, rather than repetition of tasks;
- (b) the development of the programme is based on data-driven EBT training topics with a link to the operator's competency framework;
- (c) training needs are addressed through training based on underlying competencies;
- (d) the programme includes:
 - (1) an evaluation phase to identify training needs based on competencies and collect population-based data; to identify the training needs means, the root cause of the deficiency observed should be identified rather than the symptoms of the deficiency;
 - (2) a manoeuvres training phase (skill retention): to train skill-based manoeuvres (body memory actions). These manoeuvres should place a significant demand on a proficient pilot; and
 - (3) a scenario-based training phase to focus on identified training needs based on competencies rather than repetition of tasks;
- (e) the programme includes the conduct of objective observations based on a competency framework, and documents evidence of the behaviour observed;
- (f) there is a customisation of syllabi:
 - (1) The operator should describe in the operations manual the procedure to customise syllabi. It should include how to:

- (i) select the example scenario elements within a training topic that should be included in the EBT programme; and
 - (ii) contextualise the example scenario elements based on the operator's operational data (e.g. input from SMS, FDM programme, etc.) and training data.
- (2) This customisation should be based on evidence both internal and external to the operator;
- (g) performance is evaluated using a competency-based grading system;
- (h) instructors grade competencies based on observable behaviours (OBs);
- (i) instructors grade the pilot using a defined methodology — observe, record, classify and assess/evaluate (ORCA) is recommended;
- (j) instructors have completed the EBT instructor standardisation;
- (k) instructors have sufficient concordance based on defined criteria (instructor concordance assurance programme);
- (l) the analysis of the pilot's performance is used to determine competency-based training needs;
- (m) there is a range of teaching styles during simulator training to accommodate trainee learning needs; and
- (n) facilitation techniques in debriefing are incorporated.

AMC2 ORO.FC.231(a) Evidence-based training

ED Decision 2021/002/R

UPSET PREVENTION AND RECOVERY TRAINING (UPRT) FOR COMPLEX MOTOR-POWERED AEROPLANES WITH A MAXIMUM OPERATIONAL PASSENGER SEATING CONFIGURATION (MOPSC) OF MORE THAN 19

Operators approved for EBT should follow the provisions for upset prevention and recovery training (UPRT) contained in [AMC1 ORO.FC.220&230](#) 'Operator conversion training and checking & recurrent training and checking'. These provisions should be included in the tables of assessment and training topics detailed in [ORO.FC.232](#).

AMC3 ORO.FC.231(a) Evidence-based training

ED Decision 2021/002/R

PERSONNEL CONDUCTING ASSESSMENT AND PROVIDING TRAINING

- (a) Ground and refresher training should be provided by suitably qualified personnel.
- (b) For non-EBT assessment and training: flight training should be provided by a flight instructor (FI), type rating instructor (TRI) or class rating instructor (CRI) or, in the case of the FSTD content, a synthetic flight instructor (SFI). The FI, TRI, CRI or SFI should satisfy the operator's standardisation, experience and knowledge requirements.
- (c) Emergency and safety equipment training should be provided by suitably qualified personnel.
- (d) CRM training should be provided by an EBT instructor or, for the classroom CRM training, a CRM trainer.
- (e) Additional personnel requirements are described in [ORO.FC.146](#) and [ORO.FC.231](#) and in the associated AMC and GM.

GM1 ORO.FC.231(a) Evidence-based training

ED Decision 2021/002/R

RECURRENT CREW RESOURCE MANAGEMENT (CRM)

Operators implementing EBT in accordance with [ORO.FC.231](#) may demonstrate compliance with [ORO.FC.115](#) by showing how the recurrent CRM requirements are integrated within the operator's EBT programme. An example of how this may be done is provided in the safety promotion material of EASA (e.g. 'EASA EBT manual').

GM2 ORO.FC.231(a) Evidence-based training

ED Decision 2021/002/R

EBT PROGRAMME — TRANSITION FROM MIXED EBT

The operator may agree with the competent authority the transition measures from mixed EBT to EBT baseline, which may include amongst others that the 3-year programme may include one or more modules in mixed EBT and one or more modules in EBT baseline, provided that all assessment and training topics in [ORO.FC.232](#) are completed in the 3-year programme.

GM3 ORO.FC.231(a) Evidence-based training

ED Decision 2022/014/R

CUSTOMISATION OF THE EBT PROGRAMME (SYLLABI)

(a) Syllabi can be customised at three different steps:

- (1) The first step would be a syllabus for the whole pilots' population (customisation only at type rating level and/or aircraft generation level). At this step, the operator customises the example scenario elements based on relevant operational data (safety management system, state safety plan, OSD, occurrences, manufacturer data, etc.), and the training topics within the module are the same (same syllabus). At this level, it may be necessary to have a different example scenario element for the different crews within the same module to ensure that pilots are exposed to surprise and unexpected events and thus avoid pilots knowing all the details of the simulator session beforehand.
- (2) The second step would be a different syllabus or part of it for the different populations of pilots. For example, some parts of the syllabus are different for the co-pilot and the captain, or the syllabus is different for the B747 pilots or for the Airbus pilots, etc. At this step, the module or part of the module is different for each population; this may include a different example scenario element for each population (or a different training topic; however, the customisation at training topic level is more difficult to control).
- (3) The third step would be syllabi tailored to the individual pilot (pilot customisation — individual syllabus). This step is linked to the procedures established for the tailored training and the additional training of the pilots following the VENN model.

(b) The procedure to describe the customisation of syllabi must be described in the OM. Customisation is based on evidence that can be gathered on three different levels, two from the inner loop, one from the outer loop.

(1) Inner loop

- (i) Individual evidence based on training data (e.g. grading metrics, training reports, questionnaires, etc.), analysed either for an individual pilot or a group of pilots (for example, all co-pilots, all B747 pilots, all pilots flying an Airbus model, etc.).

- (ii) Operator-specific evidence gathered through the safety management process in accordance with [ORO.GEN.200](#).
- (2) Outer loop
Evidence gathered from external sources such as authorities (e.g. state safety plan, etc.), OEMs (e.g. OEBs, OSD, safety documentation such as getting to grip, etc.

GM4 ORO.FC.231(a) Evidence-based training

ED Decision 2021/002/R

EBT PROGRAMME

Further guidance on the EBT programme can be found in the EASA EBT manual.

AMC1 ORO.FC.231(a)(1) Evidence-based training

ED Decision 2021/002/R

EXPERIENCE IN MIXED EBT TO SUBSTITUTE [ORO.FC.230](#)

- (a) The operator should have a minimum experience of 3 years of a mixed EBT programme. Note: More information on a mixed EBT programme is provided in [GM1 ORO.FC.230\(a\);\(b\);\(f\)](#) and in [GM2 ORO.FC.A.245](#).
- (b) The operator should demonstrate 2 years of an instructor concordance assurance programme.
- (c) The operator should demonstrate 1 year of a valid equivalency of malfunctions.
- (d) The operator should demonstrate 1 year of integration of the training data in the customisation of the EBT programme and SMS data for the contextualisation of the example scenario elements.
- (e) The operator should demonstrate that there is a verification of the grading system and feedback is provided to the training system performance and to the instructor standardisation concordance assurance.

SUBSTITUTION OF THE REQUIREMENTS OF [ORO.FC.230](#)

- (f) One complete EBT module substitutes one operator proficiency check (OPC).
- (g) The line evaluation of competence substitutes the line check.

AMC1 ORO.FC.231(a)(2) Evidence-based training

ED Decision 2021/002/R

EBT PROGRAMME AND ASSESMENT AND TRAINING TOPICS — RESILIENCE

- (a) Compliance with the table of assessment and training topics ensures that crews are presented with an array of realistic changing events that allow for resilience development purposes.
- (b) The EBT programme should be designed observing the following principles for resilience development:
 - (1) Resilience, surprise, and unexpected events
The EBT programme should be designed in such a way that in every cycle the simulator session (or part of it) allows variations so that the pilots are not familiar with the scenarios presented in the simulator session. Variations should be the focus of EBT programme

design, and should not be left to the discretion of individual instructors, in order to preserve programme integrity and fairness.

(2) Resilience and decision-making (dilemma)

The EBT programme should be designed in such a way that in every cycle the crews are exposed to a scenario where more than one possible and less than ideal solutions exist, with some unfavourable conditions attached to each solution.

AMC2 ORO.FC.231(a)(2) Evidence-based training

ED Decision 2021/002/R

VALIDITY OF THE EBT MODULE

- (a) The validity period should be counted from the end of the month when the module was completed. When the module is undertaken within the last 3 months of the validity period, the new validity period should be counted from the original expiry date.
- (b) In the context of [ORO.FC.130](#) point (a), the pilot should have a valid module.

GM1 ORO.FC.231(a)(2) Evidence-based training

ED Decision 2021/002/R

EBT PROGRAMME AND ASSESMENT AND TRAINING TOPICS — RESILIENCE

- (a) For resilience development, crews should be exposed to an array of realistic changing scenarios. The strategies developed by the crews whilst coping with different causes of action will create opportunities for resilience development.
- (b) Resilience and surprise

The operator may create a comprehensive list of scenarios to ensure that each crew is trained in different scenarios avoiding the same scenarios for all crews. This relates to training topic 'surprise' and to the customisation of the EBT programme.

- (c) Resilience and unexpected events

Exposing crews to rare, fortuitous, events may prepare crews to deal with other unexpected events. For instance, the table of assessment and training topics offers infrequent example scenario elements such as flying over 'no fly zone', etc. The operator may also take infrequent examples from occurrence reporting, or SMS, or manufacturer reports, etc. This relates to decision-making (PSD) — see OB 6.9 'Demonstrates resilience when encountering an unexpected event'.

- (d) Dilemma

The operator may create scenarios suitable for training of threat assessment, threat management processes and option generation, leading to an optimum decision-making process. At programme design, as in real life, one 'correct answer' should be avoided; instead, the EBT programme should offer the crews a number of less than ideal courses of actions; some with unfavourable conditions attached. This relates to decision-making (PSD) and to the contextualisation of the example scenario element.

GM2 ORO.FC.231(a)(2) Evidence-based training

ED Decision 2021/002/R

EBT PROGRAMME — TRAINING PHASE — IN-SEAT INSTRUCTION (ISI)

- (a) Effective monitoring and error detection are increasingly important when operating highly reliable automated aircraft.
- (b) In-seat instruction may be used as a valuable tool to maintain and develop the training objectives of some of the training topics, such as skills of monitoring, cross-checking, error management, and recognition of mismanaged aircraft state.

GM3 ORO.FC.231(a)(2) Evidence-based training

ED Decision 2022/014/R

EBT PROGRAMME — ORDER OF THE PHASES

The order of the phases is intended as follows:

- (a) First, the EVAL; and
- (b) Second, and in a timely manner after the EVAL, the training phases. The training phases are the MT and the SBT and may be delivered in any order.

Further guidance can be found in the EASA EBT manual.

AMC1 ORO.FC.231(a)(3) Evidence-based training

ED Decision 2021/002/R

EBT PROGRAMME — ENROLMENT

- (a) Enrolment is when a flight crew member commences the first EBT module.
- (b) A flight crew member is considered to leave the operator's EBT programme (de-enrolled) when the operator is no longer responsible for the administrative action for the flight crew's licence revalidation under an EBT programme.
- (c) The operator should inform the flight crew members who fail to demonstrate an acceptable level of competence and leave the operator's EBT programme (de-enrolled) that they should not exercise the privileges of that type rating.

GM1 ORO.FC.231(a)(3) Evidence-based training

ED Decision 2021/002/R

MODULE SEPARATION BY A PERIOD OF NOT LESS THAN 3 MONTHS

- (a) The separation begins when the first module finished (end of the training phase) and the second module begins (EVAL).
- (b) When the operator decides to do more than two modules during the validity period of the type rating (approximately 1 year), the operator may count the 3 months of separation between the first and the third module if it so wishes.
- (c) The separation of 3 months applies even between modules in different validity periods.

AMC1 ORO.FC.231(a)(4) Evidence-based training

ED Decision 2021/002/R

INSTRUCTOR CONCORDANCE ASSURANCE PROGRAMME (ICAP)

- (a) The ICAP should be able to identify areas of weak concordance to drive improvement in the quality and validity of the grading system.
- (b) The ICAP should be adapted to the size and complexity of the instructors' group and the complexity of the operator's EBT programme.
- (c) Complex operators should include an ICAP-specific data analysis, demonstrating:
 - (1) instructor-group assessment homogeneity (agreement);
 - (2) instructor assessment accuracy (alignment).
- (d) The operator should verify the concordance of the instructors:
 - (1) once every cycle;
 - (2) for a sufficient number of competency-grade combinations.
- (e) The operator should establish procedures to address those instructors who do not meet the standards required.
- (f) The operator should maintain a list with the EBT instructors qualified to deliver the EBT programme.

GM1 ORO.FC.231(a)(4) Evidence-based training

ED Decision 2021/002/R

INSTRUCTOR CONCORDANCE ASSURANCE PROGRAMME (ICAP)

- (a) Instructor concordance is a tool for continuous improvement of the EBT programme as data reliability results in a more accurate and effective training.
- (b) The operator may have a more frequent, or even a continuous, assessment of concordance as it provides more opportunities to improve.
- (c) Concordance standards are normally set by the operator; however, the competent authority may recommend criteria, as licences' revalidation is performed under EBT.
- (d) Individual instructor concordance may be verified:
 - (1) through uniform standardisation material where at least three different levels of performance are included and for all the competencies at a frequency of 72 months;
 - (2) by reference to the analysis of the data produced by the instructor every 12 months; normalisation may be necessary as there is no homogeneity of all EBT modules and the pilots that the instructor assessed; and
- (e) Instructor-group assessment homogeneity (agreement) may be inferred from instructors who have observed the same content.
- (f) Instructor assessment accuracy (alignment) may be inferred from comparing instructor assessments with an 'assessment standard' consisting of correctly identified competency(-ies) and correctly identified grade levels. Neither the competency(-ies) nor the grade level(s) may be communicated in advance to the instructors. The assessment standards may be set by consensus of a standards group, in order to guard against individual biases.

- (g) When the operator uses a small group of instructors (e.g. 10), the data-driven concordance assurance programme may be directly integrated into the annual refresher training, removing the need for the above guidance.
- (h) Operators with a complex group of instructors (e.g. a big rotation of instructors, subcontracted instructors, big number of instructors, many different fleets, etc.) may need to implement a more extensive concordance assessment system.

AMC1 ORO.FC.231(a)(5) Evidence-based training

ED Decision 2021/002/R

CONTINGENCY PROCEDURES FOR UNFORESEEN CIRCUMSTANCES THAT MAY AFFECT THE DELIVERY OF THE MODULE

- (a) The operator should detail in the EBT programme the contingency procedures in the event of unforeseen circumstances that may affect the delivery of the module (e.g. long-term sick pilot).
- (b) In case of unforeseen interruption of a module at any point, the missing parts of the module should be rescheduled.
 - (1) The pilot may continue line flying until the expiry of the validity period unless the performance observed was below the minimum acceptable level.
 - (2) If the interruption results in an instructor change, the operator should ensure that the instructor completing the module is provided with the details of the performance of the pilots.
- (c) In case the pilot misses modules and does not meet the requirements of recent experience (FCL.060):
 - (1) when the pilot misses one module out of the two modules required, the EVAL of the missing module should be rescheduled before the pilot can resume line operations. The MT and SBT phases of the missing module should be completed 30 days after the EVAL or before the expiry date, whichever occurs first;
 - (2) when the pilot misses one module in the preceding 12 months but the pilot's rating is expired by less than 3 months, the missing module should be rescheduled before the pilot can resume line operations;
 - (3) when the pilot misses one module in the preceding 12 months but the pilot's rating is expired by longer than 3 months but shorter than 1 year, the missing module should be rescheduled. The evaluation should be delivered by an EBT instructor (or instructors) with examiner privileges before the pilot can resume line operations;
 - (4) when the pilot misses two modules and the pilot's rating is valid:
 - (i) one module should be rescheduled before the pilot can resume line operations using an EBT instructor (or instructors) with examiner privileges; and
 - (ii) training topics B and C of the other module should be rescheduled before the expiry date.

In such case, the 3-month separation requirement between modules may not apply;

 - (5) when the pilot misses two modules and the pilot's rating is expired by less than 1 year:
 - (i) one module should be rescheduled using an EBT instructor (or instructors) with examiner privileges; and

- (ii) training topics B and C of the other module should be rescheduled before the pilot can resume line operations.

In such case, the period of 3-month separation between modules may not apply; and

- (6) if the amount of time elapsed since the expiry of the rating is more than 1 year, the pilot is de-enrolled. AMC1 FCL.625(c) 'IR — Validity, revalidation and renewal' and AMC1 FCL.740(b)'Validity and renewal of class and type ratings' apply.
- (d) In the case of other situations not covered by points (b) or (c), point (a) applies.

GM1 ORO.FC.231(a)(5) Evidence-based training

ED Decision 2022/014/R

CONTINGENCY PROCEDURES — RATINGS RENEWAL

- (a) The renewal of ratings (e.g. type rating or instrument rating) in EBT follows the Annex I (Part-FCL) to the Aircrew Regulation provisions (IRs and AMC) and is complemented with the provisions covered in [AMC1 ORO.FC.231\(a\)\(5\)](#). The ATO or the operator will determine the amount of training following Part-FCL; however, as EBT combines assessment and training, the following guidance is applicable:
 - (1) Expiry shorter than 3 months may not require additional training in Part-FCL. In EBT, the missing module is rescheduled with an EBT instructor. Following that, the EBT manager for the type rating may renew the licence without extra training, as the EBT programme is now completed (at least two modules in the last 12 months).
 - (2) In Part-FCL, when the expiry is longer than 3 months but shorter than 1 year, there need to be two training sessions. In EBT, there are two cases:
 - (i) One module is missing: the pilot must complete the missing module (two simulator sessions) before resuming line operations. Following that, the EBT manager for the type rating may renew the licence in accordance with Appendix 10 as the EBT programme is now completed (two modules in the last 12 months).
 - (ii) Two modules are missing: the pilot must complete one module (two simulator sessions) and training topics B and C of the other missing module (an extra simulator session) with a total of three simulator sessions. Training data is gathered in a short time period; therefore, an EBT instructor with examiner privilege is involved to ensure the proficiency of the pilot.
- (b) In case of an expiry longer than 1 year, the requirements of Part-FCL will be followed and the proficiency checks will be performed in accordance with Appendix 9 as the EBT system may not have sufficient training data for the pilot.

Expiry longer than 1 year but shorter than 3 years: a minimum of three training sessions in which the most important malfunctions in the available system are covered plus a proficiency check in accordance with Appendix 9 to renew the licence.

AMC1 ORO.FC.231(b) Evidence-based training

ED Decision 2021/002/R

RECOMMENDED EBT COMPETENCIES (EASA COMPETENCY FRAMEWORK)

- (a) The operator should include in its EBT programme at least the following competencies:

Application of knowledge (KNO)	
Description:	Demonstrates knowledge and understanding of relevant information, operating instructions, aircraft systems and the operating environment
OB 0.1	Demonstrates practical and applicable knowledge of limitations and systems and their interaction
OB 0.2	Demonstrates the required knowledge of published operating instructions
OB 0.3	Demonstrates knowledge of the physical environment, the air traffic environment and the operational infrastructure (including air traffic routings, weather, airports)
OB 0.4	Demonstrates appropriate knowledge of applicable legislation.
OB 0.5	Knows where to source required information
OB 0.6	Demonstrates a positive interest in acquiring knowledge
OB 0.7	Is able to apply knowledge effectively

Application of procedures and compliance with regulations (PRO)	
Description:	Identifies and applies appropriate procedures in accordance with published operating instructions and applicable regulations
OB 1.1	Identifies where to find procedures and regulations
OB 1.2	Applies relevant operating instructions, procedures and techniques in a timely manner
OB 1.3	Follows SOPs unless a higher degree of safety dictates an appropriate deviation
OB 1.4	Operates aircraft systems and associated equipment correctly
OB 1.5	Monitors aircraft systems status
OB 1.6	Complies with applicable regulations
OB 1.7	Applies relevant procedural knowledge

Communication (COM)	
Description:	Communicates through appropriate means in the operational environment, in both normal and non-normal situations
OB 2.1	Determines that the recipient is ready and able to receive information
OB 2.2	Selects appropriately what, when, how and with whom to communicate
OB 2.3	Conveys messages clearly, accurately and concisely
OB 2.4	Confirms that the recipient demonstrates understanding of important information
OB 2.5	Listens actively and demonstrates understanding when receiving information
OB 2.6	Asks relevant and effective questions
OB 2.7	Uses appropriate escalation in communication to resolve identified deviations
OB 2.8	Uses and interprets non-verbal communication in a manner appropriate to the organisational and social culture
OB 2.9	Adheres to standard radiotelephone phraseology and procedures
OB 2.10	Accurately reads, interprets, constructs and responds to datalink messages in English

Aeroplane flight path management — automation (FPA)	
Description:	Controls the flight path through automation
OB 3.1	Uses appropriate flight management, guidance systems and automation, as installed and applicable to the conditions
OB 3.2	Monitors and detects deviations from the intended flight path and takes appropriate action
OB 3.3	Manages the flight path to achieve optimum operational performance
OB 3.4	Maintains the intended flight path during flight using automation whilst managing other tasks and distractions
OB 3.5	Selects appropriate level and mode of automation in a timely manner considering phase of flight and workload
OB 3.6	Effectively monitors automation, including engagement and automatic mode transitions

Aeroplane flight path management — manual control (FPM)	
Description:	Controls the flight path through manual control
OB 4.1	Controls the aircraft manually with accuracy and smoothness as appropriate to the situation
OB 4.2	Monitors and detects deviations from the intended flight path and takes appropriate action
OB 4.3	Manually controls the aeroplane using the relationship between aeroplane attitude, speed and thrust, and navigation signals or visual information
OB 4.4	Manages the flight path to achieve optimum operational performance
OB 4.5	Maintains the intended flight path during manual flight whilst managing other tasks and distractions
OB 4.6	Uses appropriate flight management and guidance systems, as installed and applicable to the conditions
OB 4.7	Effectively monitors flight guidance systems including engagement and automatic mode transitions

Leadership & teamwork (LTW)	
Description:	Influences others to contribute to a shared purpose. Collaborates to accomplish the goals of the team
OB 5.1	Encourages team participation and open communication
OB 5.2	Demonstrates initiative and provides direction when required
OB 5.3	Engages others in planning
OB 5.4	Considers inputs from others
OB 5.5	Gives and receives feedback constructively
OB 5.6	Addresses and resolves conflicts and disagreements in a constructive manner
OB 5.7	Exercises decisive leadership when required
OB 5.8	Accepts responsibility for decisions and actions
OB 5.9	Carries out instructions when directed
OB 5.10	Applies effective intervention strategies to resolve identified deviations
OB 5.11	Manages cultural and language challenges, as applicable

Problem-solving — decision-making (PSD)	
Description:	Identifies precursors, mitigates problems, and makes decisions
OB 6.1	Identifies, assesses and manages threats and errors in a timely manner
OB 6.2	Seeks accurate and adequate information from appropriate sources
OB 6.3	Identifies and verifies what and why things have gone wrong, if appropriate
OB 6.4	Perseveres in working through problems whilst prioritising safety
OB 6.5	Identifies and considers appropriate options
OB 6.6	Applies appropriate and timely decision-making techniques
OB 6.7	Monitors, reviews and adapts decisions as required
OB 6.8	Adapts when faced with situations where no guidance or procedure exists
OB 6.9	Demonstrates resilience when encountering an unexpected event

Situation awareness and management of information (SAW)	
Description:	Perceives, comprehends and manages information and anticipates its effect on the operation
OB 7.1	Monitors and assesses the state of the aeroplane and its systems
OB 7.2	Monitors and assesses the aeroplane's energy state, and its anticipated flight path
OB 7.3	Monitors and assesses the general environment as it may affect the operation
OB 7.4	Validates the accuracy of information and checks for gross errors
OB 7.5	Maintains awareness of the people involved in or affected by the operation and their capacity to perform as expected
OB 7.6	Develops effective contingency plans based upon potential risks associated with threats and errors
OB 7.7	Responds to indications of reduced situation awareness

Workload management (WLM)	
Description:	Maintains available workload capacity by prioritising and distributing tasks using appropriate resources
OB 8.1	Exercises self-control in all situations
OB 8.2	Plans, prioritises and schedules appropriate tasks effectively
OB 8.3	Manages time efficiently when carrying out tasks
OB 8.4	Offers and gives assistance
OB 8.5	Delegates tasks
OB 8.6	Seeks and accepts assistance, when appropriate
OB 8.7	Monitors, reviews and cross-checks actions conscientiously
OB 8.8	Verifies that tasks are completed to the expected outcome
OB 8.9	Manages and recovers from interruptions, distractions, variations and failures effectively while performing tasks

AMC2 ORO.FC.231(b) Evidence-based training

ED Decision 2021/002/R

ADAPTED COMPETENCY MODEL

- (a) An operator seeking to develop an adapted competency model under [ORO.GEN.120](#) should:
 - (1) identify positive behaviours and use language that avoids ambiguity; and
 - (2) demonstrate equivalence to the recommended EBT competencies in [AMC1 ORO.FC.231\(b\)](#).
- (b) In order to demonstrate equivalence, the operator should map the competencies and observable behaviours to the recommended EBT competencies.
- (c) When the operator is translating [AMC1 ORO.FC.231\(b\)](#) into its common language, the application of [ORO.GEN.120](#) may not be necessary. The translation may not be literal.

GM1 ORO.FC.231(b) Evidence-based training

ED Decision 2021/002/R

ADAPTED COMPETENCY MODEL/POSITIVE OBSERVABLE BEHAVIOUR

- (a) OBs should describe behaviours that contribute to positive pilot performance.
- (b) The indicators should clearly describe how a competency is expected to be demonstrated by a crew member in the context of the operational environment.
- (c) If the operator makes small adjustments in the wording used to describe the OBs of the EASA competency framework in order to improve the understanding of the pilots while maintaining the same meaning, it may be considered as EASA competency framework and not as an adapted competency model.

AMC1 ORO.FC.231(c) Evidence-based training

ED Decision 2022/014/R

TRAINING SYSTEM PERFORMANCE — FEEDBACK PROCESS

- (a) Feedback process is the continuous process of collecting and analysing assessment and training data from an EBT programme.
- (b) The feedback process should use defined metrics to collect data in order to:
 - (1) identify trends and ensure corrective action where necessary;
 - (2) identify collective training needs;
 - (3) review, adjust and continuously improve the training programme;
 - (4) further develop the training system; and
 - (5) standardise the instructors (when the standardisation and concordance assurance programme is integrated into the training system performance).
- (c) The following defined metrics should be collected as a minimum:
 - (1) level 0 grading metrics (competent metrics): data metrics providing the information whether the pilot(s) is (are) competent or not;
 - (2) level 1 grading metrics (competency metrics): quantifiable data from the grading system — numeric grade of the competencies (e.g. 1 to 5);

- (3) level 2 grading metrics (observable behaviour metrics): the instructors record predetermined OBs during the session;
- (4) level 3 grading metrics (other metrics): the instructors may record other data (e.g. abstract, specific tasks, actions, questions, etc.).
- (d) Alternatively, where a system for the measurement of training system performance already exists, the operator may use it and, if necessary, adapt it to meet the demands of EBT.

AMC2 ORO.FC.231(c) Evidence-based training

ED Decision 2021/002/R

FEEDBACK PROCESS — DATA PROTECTION — GRADING SYSTEM

- (a) The objective of protecting the EBT data is to avoid inappropriate use of it in order to ensure the continued availability of such data, to maintain and improve pilot competencies.
- (b) The data access and security policy should restrict information access to authorised persons.
- (c) The data access and security policy should include the measures to ensure the security of the data (e.g. information security standard).
- (d) The data access and security policy (including the procedure to prevent disclosure of crew identity) should be agreed by all parties involved (airline management and flight crew member representatives nominated either by the union or the flight crew themselves).
- (e) The data access and security policy should be in line with the organisation safety policy in order to not make available or to not make use of the EBT data to attribute blame or liability.
- (f) The operator may integrate the security policy within other management systems already in place (e.g. information security management).

GM1 ORO.FC.231(c) Evidence-based training

ED Decision 2021/002/R

TRAINING SYSTEM PERFORMANCE — FEEDBACK PROCESS — METRICS

- (a) Training metrics within the feedback process are a valuable source of data. Typical metrics may include but are not limited to:
 - (1) differences in success rates between training topics;
 - (2) the trainees' feedback (e.g. surveys), which provides a different perspective as to the quality and effectiveness of the training;
 - (3) instructor concordance assurance: this system is important to measure the effectiveness of the instructor calibration process. It is important to remind that the purpose of this system is not to spy on instructors or to pressure individuals to change their grading;
 - (4) level 0 grading metrics (competent metrics): Metrics examples: distribution of pilots not competent after the SBT, distribution of pilots not competent in the EVAL and competent after the SBT;
 - (5) level 1 grading metrics (competency metrics): Metrics examples:
 - (i) distribution of level of performance within the range of competencies;
 - (ii) differences in grades between aircraft types;

- (6) level 2 grading metrics (observable behaviour metrics): e.g. in specific example scenario elements. Metrics example: differences in displaying OBs between ranks of pilots;
 - (7) level 3 grading metrics (other metrics such as data based on tasks): for instance, did the pilot calculate the landing distance? Or, did the pilots make a call-out in a specific manoeuvre? This level is usually linked to data collection of the SMS or EBT feedback loop (e.g. was the call-out of the TCAS manoeuvre correct? 'TCAS I have control'). Metrics example: distribution of errors for various training scenarios and aircraft types.
 - (8) during the simulator session, the operator may consider the level of grading metrics that the instructor needs to collect, taking into consideration the workload of the instructor.
- (b) Training metrics are an invaluable component in supporting an EBT programme, but they must be placed in the context of operational data because only the latter can justify the importance of specific training. For this purpose, data from the line evaluation of competence is important to measure the effectiveness of the EBT programme in operations. It may include data from the process for the monitoring of line operations.
- (c) Complex operators may, in the context of their safety management system, establish a safety action group dedicated to training: 'training safety action group'. This may be a best practice to meet the implementing rule.

GM2 ORO.FC.231(c) Evidence-based training

ED Decision 2021/002/R

FEEDBACK PROCESS — DATA PROTECTION – GRADING SYSTEM

- (a) The data access and security policy may, as a minimum, define:
- (1) a policy for access to information only to specifically authorised persons identified by their position in order to perform their duties. The required authorised person(s) does (do) not need to be the EBT manager; it could be the EBT programme manager or a third party mutually acceptable to unions or staff and management. The third party may also be in charge of ensuring the correct application of the data access and security policy (e.g. the third party is the one activating the system to allow access to the authorised persons);
 - (2) the identified data retention policy and accountability;
 - (3) the measures to ensure that the security of the data includes the information security standard (e.g. information security management systems standard e.g. ISO 2700x-ISO 27001, NIST SP 800-53, etc.);
 - (4) the method to obtain de-identified crew feedback on those occasions that require specific follow-up; and
- (b) When there is a need for data protection, it is preferable to de-identify the data rather than anonymise it.

AMC1 ORO.FC.231(d)(1) Evidence-based training

ED Decision 2021/002/R

GRADING SYSTEM

- (a) The grading system should provide quantifiable data for the measurement of the training system performance.

- (b) The grading scale should be 1 to 5, where:
- (1) Grade 1 — NOT COMPETENT — determines that the minimum acceptable level of performance was not achieved for the conduct of line operations. An outcome of ADDITIONAL TRAINING REQUIRED and level 2 grading metrics should be recorded.
 - (2) Grade 2 to 5 determine an outcome of COMPETENT for the conduct of line operations.
 - (3) Grade 2 (below the average) determines that the minimum acceptable level was achieved for the conduct of line operations. Additionally, level 2 grading metrics should be recorded.

Minimum performance indicates a need for training (e.g. tailored or additional) to elevate performance. It includes:
 - (i) a competency graded continuously with 2 in multiple modules, or
 - (ii) the majority of competencies graded with 2 in a module.
 - (4) Grade 3 is the average.
 - (5) Grade 4 determines that the pilot is above the average.
 - (6) Grade 5 (exemplary) determines that the pilot is above the average and the outcome is enhanced safety, effectiveness and efficiency.
- (c) The operator should develop further grading guidance to the above points to help the instructors determine the grade of the pilots they assess.

AMC2 ORO.FC.231(d)(1) Evidence-based training

ED Decision 2021/002/R

GRADING SYSTEM — ALTERNATIVE SYSTEM

- (a) An operator seeking to develop an alternative grading system under [ORO.GEN.120](#) should:
- (1) provide quantifiable data for the measurement of the training system performance; and
 - (2) demonstrate equivalence to the recommended grading system in [AMC1 ORO.FC.231\(d\)\(1\)](#).
- (b) The grading scale for each competency should:
- (1) determine the grade at which the performance is considered:
 - (i) NOT COMPETENT for the conduct of line operations. An outcome of ADDITIONAL TRAINING REQUIRED and level 2 grading metrics should be recorded; and
 - (ii) COMPETENT for the conduct of line operations; and
 - (2) determine for the pilot whose performance is considered competent for the conduct of line operations:
 - (i) if the pilot needs more training (e.g. tailored or additional training) to elevate their performance to the operator specified norm;
 - (ii) if the pilot is at the operator specified norm;
 - (iii) if the pilot is above the average (it can be one or more grades e.g. above the average and exemplary).

- (c) The operator should develop further guidance to the above points to help the instructors determine the grade of the pilots they assess.

AMC3 ORO.FC.231(d)(1) Evidence-based training

ED Decision 2021/002/R

RECOMMENDED CONDUCT OF THE GRADING — ORCA

- (a) Grading the performance of flight crew members during an EBT module should include the following steps:
- (1) Observe performance (behaviours) during the simulator session.
 - (2) Record details of effective and ineffective performance (behaviours) observed during the simulator session ('record' in this context refers to instructors taking notes).
 - (3) Classify observations against the OBs and allocate the OBs to each competency (or competencies), using amongst others the facilitation technique.
 - (4) Assess and evaluate (grade): assess the performance by determining the root cause(s) according to the competency framework. Low performance would normally indicate the area of performance to be remediated in subsequent phases or modules. Evaluate (grade) the performance by determining a grade for each competency using a methodology defined by the operator.
- (b) As a minimum, the instructor should grade all the observed competencies at:
- (1) the end of the EVAL (de-briefing) by providing at least level 1 grading metrics;
 - (2) the end of the MT (de-briefing) by providing at least level 0 grading metrics; and
 - (3) at the end of the EBT module (de-briefing) by providing at least level 0 grading metrics (level 1 grading metrics are recommended).

AMC4 ORO.FC.231(d)(1) Evidence-based training

ED Decision 2022/014/R

RECOMMENDED GRADING SYSTEM METHODOLOGY — VENN MODEL

- (a) To grade a competency, the instructor should assess the associated OBs of each competency against the following dimensions by determining:
- (1) what was the outcome of the threat management, error management and undesired aircraft state management relating specifically to the competency being assessed;
 - (2) how well the flight crew member demonstrated the OB(s) when they were required. This includes:
 - (i) how many OBs the flight crew member demonstrated over the EBT phase (e.g. EVAL, MT, SBT) when they were required; and
 - (ii) how often the flight crew member demonstrated the OB(s) when they were required;

Abbreviated word picture VENN model				
	TEM	Observable behaviours		
Grading	OUTCOME (1)	HOW WELL (2) =	HOW MANY (i)+	HOW OFTEN (ii)
1	unsafe situation	ineffectively	few, hardly any	rarely
2	not an unsafe situation	minimally acceptable	some	occasionally
3	safe situation	adequately	many	regularly
4	safe situation	effectively	most	regularly
5	enhanced safety, effectiveness and efficiency	in an exemplary manner	all, almost all	always

- (b) Grades should be determined during each EBT module as follows:
- (1) EVAL — overall performance of the phase for each competency at level 1 grading metrics.
 - (2) MT — overall performance of the phase at level 0 grading metrics. When the phase is graded ‘not competent’, it requires level 2 grading metrics.
Note: Only a limited number of competencies may be observed and graded in this phase (e.g. PRO, FPA, FPM); the others are ‘to be left in blank’.
 - (3) SBT — overall performance of the phase for each competency at level 1 grading metrics. Unless just culture and the necessary non-jeopardy environment during training may be compromised. In that case, level 0 grading metrics.
Note: In-seat instruction (ISI) should not be included in any assessment.
- (c) Where any competency is graded below the minimum acceptable level of performance (grade 1 on a 5-point scale), an outcome of additional FSTD training is required.
- (1) Additional level 2 grading metrics must be recorded.
 - (2) The flight crew member should not be released to unsupervised line operations until each competency is demonstrated at or above the minimum acceptable level of performance.
- (d) Where all competencies are determined at or above the minimum acceptable level of performance (grade 2 on a 5-point scale), the outcome should be COMPETENT. Consistent grading below the average (2 on a 5-point scale) may indicate a need for training to elevate the performance to the average (grade 3 on a 5-point scale). As a minimum, the following conditions apply:
- (1) Any competency graded with 2 requires level 2 grading metrics.
 - (2) Any competency graded with 2 in any simulator session of the 1st module followed by a grade 2 in the same competency in the EVAL of the 2nd module requires individual tailored training in the SBT of the 2nd module. (First example: 1st Module SBT graded with 2, 2nd Module EVAL graded with 2 in the same competency, thus the 2nd SBT should be an individual tailored training on that competency. Second example: 1st module EVAL graded 2, 2nd module EVAL graded 2 on the same competency, thus the 2nd module SBT should be individual tailored training on that competency).
 - (3) Any competency graded with 2 in three consecutive modules requires individual tailored training. If at the end of the tailored training (3rd SBT) the competency continues being

graded with 2, additional FSTD training is required within the next 3 months. For instance, following the example above, the SBT in the 2nd Module was an individual tailored training. In the 3rd Module during the EVAL the same competency is graded with 2 and individual tailored training is applied. The SBT is graded with 2 again. The pilot may continue line operations but should receive additional FSTD training within the next 3 months.

- (4) The operator should not release a flight crew member to unsupervised line operations when more than four competencies (the majority of the competencies — five competencies or above) are graded with 2 in any single simulator session of the module.
- (5) Any EVAL graded with 2 in more than three competencies requires individual tailored training in the SBT. If at the end of the module more than three competencies continue being graded with 2, the pilot may continue line operations but should receive additional FSTD training within the next 3 months.
- (e) 'Individual tailored training' refers to a simulator session tailored to the pilot's individual training needs, which may require a different programme or syllabus. Normally, it may be done during the SBT and normally there is not an increase of FSTD volume (no extra simulator session). It may require an increased volume of training such as CBT, additional briefings, etc. Any individual tailored training may be substituted by additional FSTD training before the start of the next module.
- (f) 'Additional FSTD training' refers to the fact that in addition to the requirements of tailored training, there is an increase of FSTD volume (extra simulator session). It normally happens after individual tailored training.

GM1 ORO.FC.231(d)(1) Evidence-based training

ED Decision 2022/014/R

RECOMMENDED CONDUCT OF THE GRADING — ORCA

- (a) At the end of the EVAL, after the facilitated de-briefing, the instructor may, as a minimum, record level 1 grading metrics.
- (b) The instructor may conduct the simulator session of the EVAL following the principles of a summative assessment and the facilitated de-briefing following the principles of a formative assessment. The MT and SBT simulator sessions may be conducted as a formative assessment.
- (c) At the end of each training phase, it is recommended to record level 1 grading metrics unless just culture and the necessary non-jeopardy environment during training may be compromised. In that case, the following alternative may be recommended: level 0 grading metrics for all competencies may be recorded (exceptionally 'not observed' or 'left in blank' may be recorded) and de-identified level 1 grading metrics may be recorded for the data collection and analysis purposes.
- (d) A simple practice to classify the observations recorded during the simulator session is to classify the OB as positive, negative, neutral.

GM2 ORO.FC.231(d)(1) Evidence-based training

ED Decision 2022/014/R

RECOMMENDED GRADING SYSTEM METHODOLOGY — VENN MODEL

- (a) Grades may be determined during each EBT module as follows:
- (1) For each assigned grade:
 - (i) the observed performance should be identified with one or more OBs; and
 - (ii) the OB(s) should simply link the observed performance to the competency; they are not to be used as a checklist.
 - (2) At the completion of the EVAL, the grade should be the overall assessment of the performance of each competency during the EVAL. Although it is not recommended, if the instructor performs an overall grade (additional to level 1), it should be at level 0 grading metric (competent or not).
 - (3) The underlying philosophy of the individual tailored training and additional FSTD training is the identification of the pilot's individual training needs during the EVAL or EVALs. However, there may be cases in which such an identification may be complemented using other phases or combination of phases along the EBT programme. Nevertheless, when this happens consistently to a large number of pilots, it may indicate a problem of instructor standardisation.
 - (4) At the completion of the MT, only a limited number of competencies can be graded. The others are to be left in blank. Note: The grade of a competency as 'not observed' is a relevant set of data to be used in the EBT programme (e.g. may be used for instructor concordance assurance programme, programme design, etc.), while 'competency left in blank' is stating the obvious, which is that MT is a skill retention phase and therefore it focuses on only some of the competencies which may provide NO opportunity to observe all the competencies.
 - (5) At the completion of the module, grades should be assigned for each competency, based on the overall assessment of training during the SBT.
 - (6) In exceptional occasions, the instructor may have been unable to assess one or two competencies in the EVAL or SBT. A 'not observed' may be graded. The training system performance and concordance assurance system may use these metrics to improve instructors' standardisation and the EBT programme design. When the operator grades the MT alone (instead of grading the MT and EVAL together), a 'not observed' grading may be frequent. It also occurs when the instructor grades each one of the manoeuvres.
- (b) The word pictures are standardised according to the VENN model but may be simplified once instructors become familiar with the system.

Word picture VENN model

Application of procedures (PRO)

5	The pilot applied procedures in an exemplary manner, by always demonstrating almost all of the observable behaviours to a high standard when required, which enhanced safety, effectiveness and efficiency
4	The pilot applied procedures effectively, by regularly demonstrating most of the observable behaviours when required, which resulted in a safe operation

3	The pilot applied procedures adequately, by regularly demonstrating many of the observable behaviours when required, which resulted in a safe operation
2	The pilot applied procedures at the minimum acceptable level, by only occasionally demonstrating some of the observable behaviours when required, but which did not result in an unsafe situation
1	The pilot applied procedures ineffectively, by rarely demonstrating any of the observable behaviours when required, which resulted in an unsafe situation

Communication (COM)

5	The pilot communicated in an exemplary manner, by always demonstrating almost all of the observable behaviours to a high standard when required, which enhanced safety, effectiveness and efficiency
4	The pilot communicated effectively, by regularly demonstrating most of the observable behaviours when required, which resulted in a safe operation
3	The pilot communicated adequately, by regularly demonstrating many of the observable behaviours when required, which resulted in a safe operation
2	The pilot communicated at the minimum acceptable level, by only occasionally demonstrating some of the observable behaviours when required, but which did not result in an unsafe situation
1	The pilot communicated ineffectively, by rarely demonstrating any of the observable behaviours when required, which resulted in an unsafe situation

Flight path management — automation (FPA)

5	The pilot managed the automation in an exemplary manner, by always demonstrating almost all of the observable behaviours to a high standard when required, which enhanced safety, effectiveness and efficiency
4	The pilot managed the automation effectively, by regularly demonstrating most of the observable behaviours when required, which resulted in a safe operation
3	The pilot managed the automation adequately, by regularly demonstrating many of the observable behaviours when required, which resulted in a safe operation
2	The pilot managed the automation at the minimum acceptable level, by only occasionally demonstrating some of the observable behaviours when required, but which did not result in an unsafe situation
1	The pilot managed the automation ineffectively, by rarely demonstrating any of the observable behaviours when required, which resulted in an unsafe situation

Flight path management — manual control (FPM)

5	The pilot controlled the aircraft in an exemplary manner, by always demonstrating almost all of the observable behaviours to a high standard when required, which enhanced safety, effectiveness and efficiency
4	The pilot controlled the aircraft effectively, by regularly demonstrating most of the observable behaviours when required, which resulted in a safe operation

3	The pilot controlled the aircraft adequately, by regularly demonstrating many of the observable behaviours when required, which resulted in a safe operation
2	The pilot controlled the aircraft at the minimum acceptable level, by only occasionally demonstrating some of the observable behaviours when required, but which did not result in an unsafe situation
1	The pilot controlled the aircraft ineffectively, by rarely demonstrating any of the observable behaviours when required, which resulted in an unsafe situation

Application of knowledge (KNO)

5	The pilot showed exemplary knowledge, by always demonstrating almost all of the observable behaviours to a high standard when required, which enhanced safety, effectiveness and efficiency
4	The pilot showed adequate knowledge, by regularly demonstrating most of the observable behaviours when required, which resulted in a safe operation
3	The pilot showed adequate knowledge, by regularly demonstrating many of the observable behaviours when required, which resulted in a safe operation
2	The pilot showed knowledge at the minimum acceptable level, by only occasionally demonstrating some of the observable behaviours when required, but which did not result in an unsafe situation
1	The pilot showed inadequate knowledge, by rarely demonstrating any of the observable behaviours when required, which resulted in an unsafe situation

Leadership & teamwork (LTW)

5	The pilot led and worked as a team member in an exemplary manner, by always demonstrating almost all of the observable behaviours to a high standard when required, which enhanced safety, effectiveness and efficiency
4	The pilot led and worked as a team member effectively, by regularly demonstrating most of the observable behaviours when required, which resulted in a safe operation
3	The pilot led and worked as a team member adequately, by regularly demonstrating many of the observable behaviours when required, which resulted in a safe operation
2	The pilot led and worked as a team member at the minimum acceptable level, by only occasionally demonstrating some of the observable behaviours when required, but which did not result in an unsafe situation
1	The pilot led or worked as a team member ineffectively, by rarely demonstrating any of the observable behaviours when required, which resulted in an unsafe situation

Problem-solving & decision-making (PSD)

5	The pilot solved problems and made decisions in an exemplary manner, by always demonstrating almost all of the observable behaviours to a high standard when required, which enhanced safety, effectiveness and efficiency
---	--

4	The pilot solved problems and made decisions effectively, by regularly demonstrating most of the observable behaviours when required, which resulted in a safe operation
3	The pilot solved problems and made decisions adequately, by regularly demonstrating many of the observable behaviours when required, which resulted in a safe operation
2	The pilot solved problems and made decisions at the minimum acceptable level, by only occasionally demonstrating some of the observable behaviours when required, but which did not result in an unsafe situation
1	The pilot solved problems or made decisions ineffectively, by rarely demonstrating any of the observable behaviours when required, which resulted in an unsafe situation

Situation awareness (SAW)

5	The pilot's situation awareness was exemplary, by always demonstrating almost all of the observable behaviours to a high standard when required, which enhanced safety, effectiveness and efficiency
4	The pilot's situation awareness was good, by regularly demonstrating most of the observable behaviours when required, which resulted in a safe operation
3	The pilot's situation awareness was adequate, by regularly demonstrating many of the observable behaviours when required, which resulted in a safe operation
2	The pilot's situation awareness was at the minimum acceptable level, by only occasionally demonstrating some of the observable behaviours when required, but which did not result in an unsafe situation
1	The pilot's situation awareness was inadequate, by rarely demonstrating any of the observable behaviours when required, which resulted in an unsafe situation

Workload management (WLM)

5	The pilot managed the workload in an exemplary manner, by always demonstrating almost all of the observable behaviours to a high standard when required, which enhanced safety, effectiveness and efficiency
4	The pilot managed the workload effectively, by regularly demonstrating most of the observable behaviours when required, which resulted in a safe operation
3	The pilot managed the workload adequately, by regularly demonstrating many of the observable behaviours when required, which resulted in a safe operation
2	The pilot managed the workload at the minimum acceptable level, by only occasionally demonstrating some of the observable behaviours when required, but which did not result in an unsafe situation
1	The pilot managed the workload ineffectively, by rarely demonstrating any of the observable behaviours when required, which resulted in an unsafe situation

AMC1 ORO.FC.231(d)(2) Evidence-based training

ED Decision 2022/014/R

VERIFICATION OF THE ACCURACY OF THE GRADING SYSTEM

- (a) The purpose is to provide data to assess the accuracy of the grading system.
- (b) The items defined below are based on Part-FCL Appendix 9. They should be included in the EVAL and MT of the applicable module. The minimum items to be included are: rejected take-off, failure of critical engine between V1 & V2, 3D approaches down to a decision height (DH) not less than 60 m (200 ft), engine-out approach & go-around, 2D approach down to the MDH/A, engine-out approach & go-around, engine-out landing.
- (c) Instructors should record if the exercises are flown to proficiency using Appendix 9 references (define criteria). Note: Individual pilots' grading and assessment remains according to the EBT grading system and Appendix 10.
- (d) This verification should be performed once every 3 years.

GM1 ORO.FC.231(d)(2) Evidence-based training

ED Decision 2021/002/R

VERIFICATION OF THE ACCURACY OF THE GRADING SYSTEM

Items that may be included in a verification of the accuracy of the grading system:

Assessment and training topic	Flight phase for	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	EPA	EPM	LTW	PSD	SAW	WIM	KNO

ED Decision 2021/002/R

VERIFICATION OF THE ACCURACY OF THE GRADING SYSTEM — FEEDBACK PROCESS

The verification of the accuracy of the grading system provides valuable data for the training system performance and concordance assurance. Therefore, the verification is necessary from a systemic point of view and the intention is not to measure individual pilot against Appendix 9 criteria.

Concordance agreement between instructors may be high; however, the whole community of instructors may be grading too low or too high (accuracy).

The statistical result of the verification against Appendix 9 criteria can provide the operator with a criterion-referenced system to adjust the accuracy of the grading system. The verification does not require an examiner; EBT instructors may provide the necessary data.

Example 1: For the last 36 months, the operator has a rate of 3 % of pilots scoring 1 (assuming the data is statistically relevant). In this example, the rate of 3 % of the pilots scoring 1 is maintained across all the technical competencies. When the operator performs a verification, the rate of failure would have been only 0,5 %. This may indicate that instructors are rating too low in EBT and therefore some of the pilots scoring 1 should have been graded with a score higher than 1. This may be economically negative for the operator. On the other hand, it could be that the operator has decided to implement higher standards.

Example 2: The operator has an EBT programme with a negligible rate of pilots scoring 1 and a 1 % of pilots scoring 2 in two consecutive recurrent modules. The verification of the technical competencies against Appendix 9 criteria provides a rate of 5 % failure. The EBT manager should further investigate the reason behind this mismatch between EBT and Appendix 9 in the technical competencies. There may be factors influencing this mismatch (e.g. statistical issues, the events in the EBT modules are too benign compared to the events in Appendix 9), which may lead to a corrective action (e.g. redesign of the EBT modules). If the difficulty of the EBT scenarios is equivalent to Appendix 9 and the concordance is high between instructors, then the discrepancy in outcomes might be because the community of instructors are grading too high in the technical competencies (they are grading with 2 when they should have graded 1). Further instructor standardisation will be needed to address this.

The implementation of mixed EBT following GM1 ORO.FC.230(a);(b);(f) provides a good opportunity to fine-tune and verify the accuracy of the grading system because an Appendix 9 licence proficiency check is carried out every year. The authority may not allow full EBT unless the accuracy of the grading system is demonstrated.

Further guidance can be found in the EASA EBT manual.

AMC1 ORO.FC.231(e) Evidence-based training

ED Decision 2021/002/R

VOLUME AND FSTD QUALIFICATION LEVEL

- (a) The EBT programme has been developed to include a notional exemplar of 48 FSTD hours over a 3-year programme for each flight crew member.
- (b) Subject to ORO.GEN.120, the operator may reduce the number of FSTD hours provided that an equivalent level of safety is achieved. The programme should not be less than 36 FSTD hours.
- (c) Each EBT module should be conducted in an FSTD with a qualification level adequate to complete proficiency checks; therefore, it should be conducted in a full-flight simulator (FFS) level C or D.

AMC1 ORO.FC.231(f) Evidence-based training

ED Decision 2021/002/R

EQUIVALENCY OF MALFUNCTIONS — PROCESS

- (a) The equivalency of malfunctions process should be undertaken by subject matter experts (SMEs) who hold or have held a type rating on the aeroplane type.
- (b) Steps of the equivalency of malfunctions
 - Step 1: Look at (review) all aircraft system malfunctions provided by the OEM. For example, FCOM for Airbus, or AFM for other manufacturers, does not normally provide an exhaustive list of malfunctions.
 - Step 2: Determine and retain in a list only malfunctions that place a significant demand on a proficient crew, in isolation from an environmental or operational context.
 - Step 3: For each retained malfunction, determine the applicable characteristic or characteristics.
 - Step 4: Develop the EBT FSTD programme to incorporate malfunctions at the frequency specified in the table of assessment and training topics.
- (c) Malfunctions included in the equivalency of malfunctions but not included in the EBT FSTD programme require review and appropriate procedural knowledge training, conducted in a less qualified but suitable alternative environment (classroom, flight procedure training device, advance computer-based training, aviation blended learning environment (ABLE), etc.). Further guidance can be found in the EASA EBT manual.
- (d) The operator should establish procedures to determine what malfunctions should be included in the FSTD. This may include a different malfunction difficulty between the EVAL and the SBT.

AMC1 ORO.FC.231(f)(3) Evidence-based training

ED Decision 2021/002/R

CREW EXPOSURE TO AT LEAST ONE MALFUNCTION FOR EACH CHARACTERISTIC

- (a) Unless specified in the OSD, each crew member should be exposed to the characteristics of degraded control and loss of instrumentation in the role of pilot flying.
- (b) Notwithstanding point (a), for aircraft types with a limited number of malfunctions in the characteristic of degraded control or loss of instrumentation, the operator may use an alternative means of compliance in accordance with [ORO.GEN.120](#).

GM1 ORO.FC.231(f) Evidence-based training

ED Decision 2021/002/R

EQUIVALENCY OF MALFUNCTIONS — SIGNIFICANT DEMAND ON A PROFICIENT CREW

- (a) The criteria to determine that a malfunction places a significant demand on a proficient crew are the following:
 - (1) The procedure includes one or more action items and not only a set of information for crew awareness.
 - (2) The flight crew's cognitive load (resources required by the mental processes of perception, memory, judgement, and reasoning) significantly increases during or after the application of the associated abnormal or emergency procedure. The cognitive load

is considered to be significantly increased when it is well above the cognitive load induced by the application of the normal standard operating procedures.

- (3) The flight crew's workload significantly increases during or after the application of the associated abnormal or emergency procedure. The workload is considered to be significantly increased when it is well above the workload induced by the application of the normal standard operating procedures.
 - (4) The aircraft handling perceived by the pilot when flying in abnormal conditions is different compared to the aircraft handling in normal conditions; e.g. the symmetry of the flight is affected.
- (b) The criteria to determine that a malfunction places a significant demand on a proficient crew allow the identification of:
- (1) the pilot competencies that are specifically challenged during the management of the related procedure, and
 - (2) the characteristic of the aircraft system malfunction procedure.

Note: The identification of the pilot competencies allows a consistent assessment to determine the proficiency of the crew member.

Criteria in (a)	Definition	Challenged Competency	Example of procedure characteristics
(1)	The procedure includes one or more action items and not only a set of information for crew awareness.	PRO KNO	multiple paths within the procedure (e.g. decision trees) multiple inoperative or degraded systems
(2)	The flight crew's cognitive load (resources required by the mental processes of perception, memory, judgement, and reasoning) significantly increases, during, or after, the application of the abnormal/emergency procedure. The cognitive load is considered to be significantly increased when it is well above the cognitive load induced by the application of the normal standard operating procedures.	SAW PSD	multiple paths within the procedure (e.g. decision trees) multiple inoperative or degraded systems a high potential for undetected errors (e.g. removal of flight protections)
(3)	The flight crew's workload significantly increases, during, or after, the application of the abnormal/emergency procedure. The workload is considered to be significantly increased when it is well above the workload induced by the application of the normal standard operating procedures.	WLM	time criticality; multiple paths within the procedure (e.g. decision trees); multiple inoperative or degraded systems; a high potential for undetected errors (e.g. removal of flight protections); and a significant increase in workload (e.g. removal of automation).

(4)	The aircraft handling perceived by the pilot when flying in abnormal conditions is different compared to the aircraft handling in normal conditions; e.g. the symmetry of the flight is affected.	FPM FPA	multiple inoperative or degraded systems a high potential for undetected errors (e.g. removal of flight protections)
-----	---	------------	---

- (c) When a malfunction is placing a significant demand on a proficient crew, it means it has one or more of the malfunction characteristics (see more in [GM2.ORO.FC.231\(f\)](#)).

GM2 ORO.FC.231(f) Evidence-based training

ED Decision 2021/002/R

EQUIVALENCY OF MALFUNCTIONS — MALFUNCTION CHARACTERISTICS

The following may be considered suitable definitions for each of the characteristics:

- 'Immediacy': System malfunctions that require immediate and urgent crew intervention or decision (e.g. malfunctions with memory items, loss of pressurisation at high altitude, brake failure during landing).
- 'Complexity': System malfunctions that require recovery procedures with multiple options to analyse and/or multiple decision paths to apply (e.g. multiple hydraulic system failures, smoke and fumes procedures).
- 'Degradation of aircraft control': System malfunctions that result in significant degradation of flight controls in combination with abnormal handling characteristics, such as modification of the normal pitch attitude during approach and landing or reconfiguration of the flight control laws or modes (e.g. jammed stabiliser, flaps/slats inoperative)
- 'Loss of instrumentation': System malfunctions that require monitoring and management of the flight path using degraded or alternative displays such as temporary or permanent loss of any flight-path-related parameter displayed on the primary flight display (PFD), head-up display (HUD) or navigation display (ND), including loss of any setting capability of one of these indications. It includes primary instrumentation to monitor and manage primary aircraft systems (e.g. FLAPS indication, loss of fuel indications, etc.).
- 'Management of consequences': System malfunctions that affect significantly the flight crew standard task sharing and/or the workload management and/or the decision-making process during an extensive period after the management of the malfunction itself (e.g. fuel leak or fuel not usable, altitude/speed limitations, malfunctions with 'deferred' items in later flight phases).

Note: Equivalency of malfunctions may be undertaken in consultation with the aircraft OEM. The objective of the OEM consultation is to review the operator analysis regarding the OEM operational certification (e.g. OSD) documents and the general OEM operation and training policy.

GM3 ORO.FC.231(f) Evidence-based training

ED Decision 2021/002/R

EQUIVALENCY OF MALFUNCTIONS — ISOLATION FROM AN ENVIRONMENTAL OR OPERATIONAL CONTEXT

When considering significant demand on a proficient crew, SMEs may consider that there are no significant environmental and operational threats. For example, the aircraft is close to a suitable aerodrome with environmental conditions permitting all published approaches to be made, with no pre-existing malfunctions and sufficient fuel for several hours (e.g. A320 or B737 overhead Ibiza - Spain, at FL350 with visible moisture at 30 000 ft, at the aerodrome wind calm, CAVOK, ISA).

GM4 ORO.FC.231(f) Evidence-based training

ED Decision 2021/002/R

EQUIVALENCY OF MALFUNCTIONS PROCESS — DELPHI

- (a) The operator reviews/looks at aircraft system malfunctions provided in the official documentation of the OEM — for example, FCOM for Airbus, or AFM for other manufacturers.
- (b) Before launching the equivalency of malfunctions survey and when the aircraft system malfunctions list is very long, the operator may slightly shorten the list by removing the malfunctions that surely will not place a significant demand of a proficient crew (see GM on SIGNIFICANT DEMAND ON A PROFICIENT CREW).
- (c) A group of EBT instructors statistically relevant will be selected to perform the equivalency of malfunctions survey. 50 % of the instructors' community will be used as a reference. In small instructors' communities, it may be necessary to refer to 100 %. In operators with large instructors' communities, the number of instructors statistically relevant may be less than 50 %.
- (d) The group of instructors selected in point (c) will rate each of the malfunctions listed in points (a) and (b)
 - (1) Each instructor will rate each one of the 5 characteristics in each malfunction listed in point (b).
 - (2) The rate will be 0 when the malfunction does not have the characteristic (the characteristic does not appear in the malfunction).
 - (3) The rate will be 1 to 5 when the characteristic appears in the malfunction. Rating 1 when the characteristic is not relevant for the malfunction and rate 5 when the characteristic is very relevant.
 - (4) The instructors will rate individually (e.g. home, classroom, etc.) to avoid exchange of opinions with other instructors.
- (e) An average rate of the whole instructors' community as a result of point (d) will be calculated for each characteristic of each malfunction.
- (f) A second round of survey will be performed with the same instructors and the same list. This time the operator will provide the average calculated in point (e) and ask them if in light of the average they would like to change their rating. Group discussion may substitute or complement the second survey.
- (g) When an instructor changes their rating, the old rate will be discarded.
- (h) A new average will be calculated for each characteristic of each malfunction at the end of the second survey. The final average will be rounded to the closest integer number.
- (i) The operator may select an average rate of the characteristics (e.g. rate 2 or 3) at which or above which the characteristic is considered to be present in the malfunction, thus it places a significant demand on a proficient crew.
- (j) The operator may use the rates of the characteristics to determine the difficulty of the malfunction. As SBT is a developing phase, the operator may select a higher difficulty of the malfunctions selected in this phase. Further guidance can be found in the EASA EBT manual.
- (k) The operator may refer to an aircraft OEM malfunction analysis to support all the steps of the session.

- (l) A simpler version of the process may be acceptable provided that:
- (1) the aircraft manufacturer provides equivalency of malfunction documentation;
 - (2) there is a minimum of three EBT instructors who have a deep knowledge of aircraft systems; and
 - (3) the instructors referred to in (2) above are properly standardised. The standardisation is based on the EBT programme design knowledge and in particular the concept, definitions and process of the equivalency of malfunctions. The simplified process may or may not use a survey and use either a two-point scale (0 and 1), three-point scale (1, 2 and 3) or five-point scale (1 to 5).

AMC1 ORO.FC.231(g) Evidence-based training

APPROACHES THAT PLACE AN ADDITIONAL DEMAND ON A PROFICIENT CREW

- (a) In order to identify approaches that place an additional demand on a proficient crew, an operator should:
- (1) review its operational network;
 - (2) select approaches with one or more of the following characteristics:
 - (i) unusual design;
 - (ii) low frequency of exposure; and
 - (iii) degraded approach guidance;
 - (3) select at least one approach of each type and method and include them in the EBT programme at the frequency given in the table of assessment and training topics; and
 - (4) ensure the approaches selected in (3) cover all the characteristics at the frequency given in the table of assessment and training topics.
- Note: The approaches listed within Section 2 of the table of assessment and training topics should be selected in this process.
- (b) Any approach that is required to be flown in the PF role specifically should be classified as 'skills retention' and may be trained in the MT.

AMC2 ORO.FC.231(g) Evidence-based training

ED Decision 2021/002/R

EQUIVALENCY OF APPROACHES RELEVANT TO OPERATIONS — SPECIFIC APPROVAL

The operator may extend the interval for recurrent training and checking of approaches that require specific approval as defined in the AMC to Part-SPA (e.g. SPA.LVO) to the frequency given in the EBT programme.

GM1 ORO.FC.231(g) Evidence-based training

ED Decision 2021/002/R

EQUIVALENCY OF APPROACHES RELEVANT TO OPERATIONS — APPROACH CHARACTERISTICS

The following may be considered suitable examples for each of the approach characteristics:

- (a) Design
 - (1) Unusual approach design feature — for example, offset final approach track or steep approach, etc.
 - (2) Unusual runway design feature — for example, non-standard lighting or marking
- (b) Frequency
 - (1) Infrequently visited airfields — for example, alternate airfields
 - (2) Infrequently flown approaches at commonly visited airfields — for example, circling approach, CAT 2, SA CATI
- (c) Degraded guidance
 - (1) Degraded internal guidance or aircraft equipment — for example, head-up display (HUD) failure
 - (2) Degraded external guidance or ground equipment — for example, GPS signal failure

GM2 ORO.FC.231(g) Evidence-based training

ED Decision 2021/002/R

SELECTED APPROACHES AT THE FREQUENCY GIVEN IN THE EBT PROGRAMME

The table of assessment and training topics for each generation provides the type of approach, flight method and frequency for the crew.

AMC1 ORO.FC.231(h) Evidence-based training

ED Decision 2021/002/R

LINE EVALUATION OF COMPETENCE

- (a) The purpose of the line evaluation of competence is to verify the capability of the flight crew member(s) to undertake line operations, including preflight and post-flight activities as specified in the operations manual. Therefore, the line evaluation of competence should be performed in the aircraft. The route should be representative of typical sectors undertaken in normal operations. The commander, or any pilot who may be required to relieve the commander, should also demonstrate their competency in the role.
- (b) Each flight crew member should be assessed according to the competency framework and grading system approved for their operator's EBT programme.
- (c) Flight crew members should be assessed in duties as pilot flying and pilot monitoring; they should be evaluated in each role. Therefore, they should be checked on one flight sector as pilot flying and on another flight sector as pilot monitoring.
- (d) The operator should maintain a list and inform the competent authority about the line evaluators suitably qualified to undertake line evaluations of competence.
- (e) The person that conducts the line evaluation of competence should occupy an observer's seat. For aeroplanes, in the case of long-haul operations where additional operating flight crew

members are carried, the person that conducts the line evaluation of competence may fulfil the function of a cruise relief pilot and should not occupy either pilot's seat during take-off, departure, initial cruise, descent, approach and landing.

- (f) The validity period should be counted from the end of the month when the line evaluation of competence was undertaken. When the line evaluation of competence is undertaken within the last 3 months of the validity period, the new validity period should be counted from the original expiry date.

AMC2 ORO.FC.231(h) Evidence-based training

ED Decision 2021/002/R

LINE EVALUATION OF COMPETENCE — LINE EVALUATOR

- (a) The line evaluator should have a valid line evaluation of competence.
- (b) The line evaluator should receive an acceptable training based on the EBT instructor training. The EBT assessment of competence is not required.

AMC1 ORO.FC.231(h)(3) Evidence-based training

ED Decision 2021/002/R

LINE EVALUATION OF COMPETENCE — EXTENSION OF THE VALIDITY

In order to extend the validity of the line evaluation of competence to:

- (a) 2 years, in every cycle, one EVAL for each pilot should be conducted by an EBT instructor (EBT instructors) who has (have) a valid line evaluation of competence in the same operator;
- (b) 3 years, in addition to point (a) above, the operator should have a feedback process for the monitoring of line operations which:
 - (1) identifies threats in the airline's operating environment;
 - (2) identifies threats within the airline's operations;
 - (3) assesses the degree of transference of training to the line operations;
 - (4) checks the quality and usability of procedures;
 - (5) identifies design problems in the human-machine interface;
 - (6) understands pilots' shortcuts and workarounds; and
 - (7) assesses safety margins.

GM1 ORO.FC.231(h) Evidence-based training

ED Decision 2021/002/R

LINE EVALUATION OF COMPETENCE

- (a) Line evaluation of competence, route and aerodrome knowledge, and recent experience requirements are intended to verify the capability of the flight crew member(s) to operate safely, effectively and efficiently under line operating conditions, including preflight and post-flight activities as specified in the operations manual. Other EBT assessments, legacy checks and emergency and safety equipment training are primarily intended to prepare flight crew members for abnormal/emergency procedures.

- (b) The line evaluation of competence is considered a particularly important factor in the development, maintenance and refinement of high operating standards, and can provide the operator with a valuable indication of the usefulness of its training policy and methods.

GM1 ORO.FC.231(h)(4) Evidence-based training

ED Decision 2021/002/R

LINE EVALUATOR

- (a) [AMC1.ORO.FC.146\(c\)](#) 'EBT instructor training' provides some learning objectives which may be used to qualify the commander nominated by the operator to perform line evaluation of competence. The training may be a minimum of 7 hours, where 1 hour may be done outside the classroom. The use of advance training environments such as advance computer-based training or ABLE may reduce further the need of classroom training. The assessment of competence may not be required. Further guidance can be found in the EASA EBT manual.
- (b) The line evaluator training may be included in the EBT instructor standardisation and concordance programme. This option is however limited due to the limited number of line evaluations of competence that are required (every 2 or 3 years), the difficulties in observing the whole range of performance of competencies and the lack of control of the environment during a line evaluation of competence. Therefore, the operator may need to use EBT instructors to maintain an acceptable level of standardisation.

AMC1 ORO.FC.231(i) Evidence-based training

ED Decision 2021/002/R

PERFORMANCE-BASED CONTINUOUS TECHNICAL GROUND TRAINING

- (a) Technical ground training programme
- (1) The objective of the technical ground training programme is to ensure that pilots have adequate:
- (i) knowledge of:
 - (A) the aircraft systems; and
 - (B) the operational procedures and requirements; and
 - (ii) awareness of:
 - (A) the most significant accidents or incidents that could affect their operations following the 'threat and error management model' or an alternative risk model agreed with the authority; and
 - (B) the occurrences in the airline or occurrences from other airlines that may be relevant for their operations, accident/incident and occurrence review.
- (2) The technical ground training should:
- (i) be conducted as part of a 3-year programme;
 - (ii) allow a customisation of syllabi. The operator should describe in the operations manual the procedure to determine the customisation of syllabi. This customisation should be based on evidence both internal and external to the operator.

- (iii) as a minimum, allow the pilot to receive technical ground training every 12 months. The validity period should be counted from the end of the month. When this training is conducted within the last 3 months of the validity period, the new validity period should be counted from the original expiry date.
 - (3) The technical ground training syllabi should be delivered using different methods and tools.
 - (i) The selection of the method and tool results from a combination of the learning objectives and the target group receiving the training (WHAT needs to be trained and WHO needs to be trained).
 - (ii) The selection of the appropriate method and tool should be driven by the desired outcome in terms of adequate knowledge.
 - (iii) The delivery of the technical ground training syllabi should include the methods or tools to verify if the pilot has acquired the objective of the technical ground training programme. This may be achieved by means a questionnaire, assessment of application of the competency 'knowledge' (KNO) or other suitable methods.
 - (4) The measurement and evaluation of the training system performance through the feedback process should include the performance of the technical ground training.
- (b) Emergency and safety equipment training
- (1) Training on the location and use of all emergency and safety equipment should be conducted in an aircraft or a suitable alternative training device.
 - (2) Every year the emergency and safety equipment training programme should include the following:
 - (i) actual donning of a life jacket, where fitted;
 - (ii) actual donning of protective breathing equipment, where fitted;
 - (iii) actual handling of fire extinguishers of the type used;
 - (iv) instruction on the location and use of all emergency and safety equipment carried on the aircraft;
 - (v) instruction on the location and use of all types of exits; and
 - (vi) security procedures.
 - (3) Every 3 years the programme of training should include the following:
 - (i) actual operation of all types of exits;
 - (ii) demonstration of the method used to operate a slide, where fitted;
 - (iii) actual firefighting using equipment representative of that carried on the aircraft on an actual or simulated fire except that, with Halon extinguishers, an alternative extinguisher may be used;
 - (iv) the effects of smoke in an enclosed area and actual use of all relevant equipment in a simulated smoke-filled environment;
 - (v) actual handling of pyrotechnics, real or simulated, where applicable;
 - (vi) demonstration in the use of the life rafts, where fitted; and

- (vii) particularly in the case where no cabin crew is required, first aid appropriate to the aircraft type, the kind of operation and the crew complement.
 - (4) The successful resolution of aircraft emergencies requires interaction between flight crew and cabin/technical crew and emphasis should be placed on the importance of effective coordination and two-way communication between all crew members in various emergency situations.
 - (5) Emergency and safety equipment training should include joint practice in aircraft evacuations so that all who are involved are aware of the duties other crew members should perform. When such practice is not possible, combined flight crew and cabin/technical crew training should include joint discussion of emergency scenarios.
 - (6) Emergency and safety equipment training should, as far as practicable, take place in conjunction with cabin/technical crew undergoing similar training with emphasis on coordinated procedures and two-way communication between the flight crew compartment and the cabin.
 - (7) The emergency and safety equipment training should include a pilot's assessment of the training received; as a minimum, by means of a questionnaire, or computer-based exercises, or other suitable methods.
 - (8) When the emergency and safety equipment training is conducted within 3 calendar months prior to the expiry of the 12-calendar-month period, the next emergency and safety equipment training should be completed within 12 calendar months of the original expiry date of the previous training.
- (c) Emergency and safety equipment training — extension of period of training
- (1) The emergency and safety equipment training programme should establish and maintain at least an equivalent level of proficiency achieved by complying with the provisions of (b). The level of flight crew proficiency in the use of emergency and safety equipment should be demonstrated prior to being granted approval to extend the period of training by the competent authority.
 - (2) The operator applying for an approval to extend the period of emergency and safety equipment training should provide the competent authority with an implementation plan, including a description of the level of flight crew proficiency to be achieved in the use of emergency and safety equipment. The implementation plan should comprise the following:
 - (i) A safety case which should:
 - (A) demonstrate that the required or equivalent level of proficiency in the use of emergency and safety equipment is maintained;
 - (B) incorporate the programme of implementation, to include controls and validity checks;
 - (C) minimise risk during all phases of the programme's implementation and operation; and
 - (D) include oversight, including review and audits.
 - (ii) The measurement and evaluation of the training system performance through the feedback process should include the performance of the emergency and safety equipment training. The feedback should be used as a tool to validate that the emergency and safety equipment training is correctly implemented; this enables

substantiation of the emergency and safety equipment training and ensures that objectives have been met.

- (iii) Documentation that details the scope and requirements of the programme, including the following:
 - (A) the operator's training needs and established operational and training objectives;
 - (B) a description of the process for designing and obtaining approval for the operator's emergency and safety equipment training programmes. This should include quantified operational and training objectives identified by the operator's internal monitoring programmes. External sources may also be used; and
 - (C) a description of how the programme will develop a support and feedback process to form a self-correcting training system.
- (3) When the emergency and safety equipment training is conducted within 6 calendar months prior to the expiry of the 24-calendar-month period, the next emergency and safety equipment training should be completed within 24 calendar months of the original expiry date of the previous training.

GM1 ORO.FC.231(i) Evidence-based training

ED Decision 2021/002/R

PERFORMANCE-BASED CONTINUOUS GROUND TRAINING — INTERNAL AND EXTERNAL EVIDENCE

- (a) Operator evidence (inner loop)
 - (1) Pilot data (individual or group);
 - (2) Population-based data according to the training metrics determined in the training system performance;
 - (3) Evidence identified or recognised through the safety management process covered in [ORO.GEN.200](#).
- (b) External evidence from the authority and manufacturers (external loop)
 - (1) Revision of existing rules and regulations, updated versions of the EBT data report, state safety plan;
 - (2) Training needs derived from updated OSD (if appropriate for ground training), etc.
- (c) The evidence drives the selection of the methods and tools.

GM2 ORO.FC.231(i) Evidence-based training

ED Decision 2021/002/R

PERFORMANCE-BASED CONTINUOUS GROUND TRAINING — METHODS AND TOOLS

This is a non-exhaustive list of methods and tools to deliver ground training:

- classroom, presentations,
- web-based training,
- self-learning instructions,

- advance CBT such as virtual reality, chatbots, interactive scenario trainers.

ORO.FC.232 EBT programme assessment and training topics

Regulation (EU) 2020/2036

- (a) The operator shall ensure that each pilot is exposed to the assessment and training topics.
- (b) The assessment and training topics shall be:
 - (1) derived from safety and operational data that are used to identify the areas for improvement and prioritisation of pilot training to guide in the construction of suitable EBT programmes;
 - (2) distributed across a 3-year period at a defined frequency;
 - (3) relevant to the type or variant of aircraft on which the pilot operates.

AMC1 ORO.FC.232 EBT programme assessment and training topics

ED Decision 2021/002/R

ASSESSMENT AND TRAINING TOPICS

Each table of assessment and training topics is specific to the aeroplane generation specified in the title. The component elements in the column headings of the matrix are as follows:

- (a) Assessment and training topic. A topic or grouping of topics derived from threats, errors or findings from data analysis, to be considered for assessment and mitigation by training.
- (b) Frequency. The priority of the topic to be considered in an EBT programme, according to the evidence derived from a large-scale analysis of operational data, is linked to a recommended frequency. There are three levels of frequency:
 - (1) A — assessment and training topic to be included with defined scenario elements during every EBT module;
 - (2) B — assessment and training topic to be included with defined scenario elements during every cycle;
 - (3) C — assessment and training topic to be included with defined scenario elements at least once in the 3-year period of the EBT programme.
- (c) Flight phase for activation. The flight phase for the realisation of the critical threat or error in the assessment and training scenario.
- (d) Description (includes type of topic, being threat, error or focus). A description of the training topic.
- (e) Desired outcome (includes performance criteria or training outcome). Simple evaluative statements on the desired outcome.
- (f) Example scenario elements (guidance material). The example scenario elements address the training topic and detail the threat and/or error that the crew are exposed to.
- (g) Competency map. Competencies marked are those considered critical in managing the scenario.

AMC2 ORO.FC.232 EBT programme assessment and training topics

ED Decision 2022/014/R

GENERATION 4 (JET) — TABLE OF ASSESSMENT AND TRAINING TOPICS

Assessment and training topic		Frequency	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Flight phase activation	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
Generation 4 Jet — Recurrent assessment and training matrix							Competency map								
Section 1 — Skill retention. Manoeuvres training phase (MT)															
MT	Rejected take-off	B	Rejected take-off after the application of take-off thrust and before reaching V1 (CAT I or above)	Demonstrate manual aircraft control skills with smoothness and accuracy as appropriate to the situation. Detect deviations through instrument scanning. Maintain spare mental capacity during manual aircraft control.	TO	From initiation of take-off to complete stop (or as applicable to the procedure)	x			x					
	Failure of the critical engine between V1 and V2	B	Failure of the critical engine (if applicable) from V1 and before reaching V2 in the lowest CAT I visibility or in LVO meteorological (MET) conditions.		TO	The manoeuvre is complete at a point when the aircraft is stabilised at normal engine-out climb speed with the correct pitch and lateral control, in trim condition and, as applicable, autopilot engagement. Only one failure of the critical engine between V1 and V2 a year may be done in LVO conditions.	x			x					
	Failure of one engine on take-off	B	Failure of one engine from V1 and before reaching V2 in the lowest CAT I visibility or in LVO MET conditions.	Maintain the aircraft within the flight envelope. Apply knowledge of the relationship between aircraft attitude, speed and thrust.	TO	The manoeuvre is complete at a point when the aircraft is stabilised in a clean configuration with engine-out procedures completed. Only one failure of the critical engine between V1 and V2 a year may be done in LVO conditions.	x			x					
			Failure of one engine above V2 (any segment of the TO)			The manoeuvre is complete at a point when the aircraft is stabilised in a clean	x		x	x					

	Pilot qualification to operate in either pilot's seat	B	As per ORO.FC.235		APP	Complete the manoeuvres mandated in ORO.FC.235.	Intentionally left in blank.
--	---	---	-------------------	--	-----	---	------------------------------

			APP			ATC clearances to waypoints beyond the programmed descent point for a coded final descent point during an approach utilising a final descent that is commanded by the flight management system	x		x				x		X
			APP												
EVAL or SBT	Competencies —non-technical (CRM)	A	APP	This encapsulates the general CRM principles and objectives. It includes communication; leadership and teamwork; problem-solving and decision-making; situation awareness and	Exposure to an event or sequence of events to allow the pilot to build awareness of human factors in aviation and the human limitations.	GPS failure prior to commencement of approach associated with position drift and a terrain alert					x	x	x		X
			DES			Cabin crew report of water noise below the forward galley indicating a possible toilet pipe leak, with consequent avionics failures					x	x	x		
			CRZ			Smoke removal but combined with a diversion until landing is completed.		x			x	x	x	x	X

Assessment and training topic	Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTV	PSD	SAW	WLM	KNO
		GND	management of information; and workload management. Emphasis should be placed on the development of leadership, shown by EBT data sources to be a highly effective competency in mitigating risk and improving safety through pilot performance.	This includes the development of the following competencies: Communication: — effective use of language; — responsiveness to feedback; and — capability to state the plans and resolve ambiguities. Leadership and teamwork: Use appropriate authority to ensure focus on the task. Support others in completing tasks. Problem-solving and decision-making: Detect deviations from the desired state, evaluate problems, identify the risk, consider alternatives and select the best course of action. Continuously review	Apron fuel spilling					x	x		x	
		CRZ			Important water leak in an aircraft galley		x			x	x		x	
		ALL			A relevant number of cabin crew are wounded or incapacitated. Additionally, the cabin crew wounded or incapacitated are the most competent (e.g. senior cabin crew member).					x	x		x	
		ALL			Unruly passenger(s)					x			x	
		GND			Passenger oxygen: passenger service unit open and mask falling down					x	x		x	
		ALL			Passenger with medical problems — medical emergency					x			x	
		CRZ			Credible threat reported to the crew. Stowaway or fugitive on board.		x			x		x	x	
		GND			No METAR or TAFOR is available for destination due to industrial action at the destination airport.	x	x			x	x			
		CRZ			Credible bomb threat reported to crew		x			x		x	x	
		CLB DES			Credible bomb threat or pressurisation problem, but no quick landing possible (due to weather, terrain or other reasons)		x			x	x		x	
		APP			Diversion with low remaining fuel or increased fuel flow due to system malfunction	x				x		x	x	
		APP			ACAS warning (resolution advisory) immediately following a go-around, with a descent manoeuvre required. (The RA should be a command for descent when the aircraft is above 1 100 ft AGL.)		x			x	x	x	x	

Assessment and training topic		Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
					progress and adjust plans. Situation awareness and management of information: Have an awareness of the aircraft state in its environment; project and anticipate changes. Workload management: Prioritise, delegate and receive assistance to maximise focus on the task. Continuously monitor the flight progress.										
EVAL or SBT	Compliance	A	ALL	Compliance failure. Consequences of not complying with operating instructions (e.g. SOPs). This is not intended to list example scenario elements, but instructors should ensure that observed non-compliances are taken as learning opportunities throughout the programme. In all modules of the programme, the FSTD	Recognise that a compliance failure has occurred. Make a verbal announcement. Take appropriate action if necessary. Restore safe flight path if necessary. Manage consequences.	The following are examples of potential compliance failures and are not intended to be developed as scenarios as part of an EBT module: 1. Requesting flap beyond limit speed 2. Flaps or slats in the wrong position for phase of flight or approach 3. Omitting an action as part of a procedure	Intentionally blank								

Assessment and training topic		Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
				should as far as possible be treated like an aircraft, and non-compliances should not be accepted simply for expediency.		4. Failing to initiate or complete a checklist 5. Using the wrong checklist for the situation									
EVAL or SBT	Go-around management	A	APP	Any threat or error that can result in circumstances that require a decision to perform a go-around, in addition to the execution of the go-around. Go-around scenarios should be fully developed to encourage effective leadership and teamwork, in addition to problem-solving and decision-making, plus execution using manual aircraft control or the flight management system(s) and automation as applicable. Design should include the element of surprise, and scenario-based go-arounds should not be predictable and anticipated. This topic is completely distinct from		Adverse-weather scenario leading to a reactive wind shear warning during approach	x	x					x	x	
			APP			Adverse-weather scenario leading to a predictive wind shear warning during approach or go-around	x	x					x	x	
			APP			Adverse-weather scenario, e.g. thunderstorm activity, heavy precipitation or icing forcing decision at or close to DA/MDA	x					x	x	x	
			APP			DA with visual reference in heavy precipitation with doubt about the runway surface braking capability	x					x	x	x	
			APP			Adverse-wind scenario resulting in increasing tailwind below DA (not reported)		x		x		x			
			APP			Adverse-wind scenario including strong gusts and/or crosswind out of limits below DA (not reported)		x		x		x			
			APP			Adverse-wind scenario including strong gusts and/or crosswind out of limits below 15 m (50 ft) (not reported)		x		x		x			
			APP			Lost or difficult communications resulting in no approach clearance prior to commencement of approach or final descent	x		x				x		
			APP			Birds: large flocks of birds below DA once visual reference has been established				x		x	x		

Assessment and training topic		Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO	
			APP	the go-around manoeuvre listed in the MT section that is intended only to practise psychomotor skills and a simple application of the procedures.		System malfunction, landing gear malfunction during the approach										
EVAL or SBT	Manual aircraft control	A	CLB CRZ DES APP	Controls the flight path through manual control	Demonstrate manual aircraft control skills with smoothness and accuracy as appropriate to the situation. Detect deviations through instrument scanning. Maintain spare mental capacity during manual aircraft control. Maintain the aircraft within the normal flight envelope. Apply knowledge of the relationship between aircraft attitude, speed and thrust.	Flight with unreliable airspeed, which may or may not be recoverable	x			x			x		X	
			CLB CRZ DES APP			Alternate flight control modes according to malfunction characteristics	x			x				x	X	
			CLB CRZ DES APP			ACAS warning (resolution advisory) requires the pilot to descend or ATC calls for immediate descent (preferably during climb which requires a significant change in aircraft attitude).	x	x		x						
						ACAS warning (resolution advisory) requires the pilot to climb or ATC calls for immediate climb (preferably during descent which requires a significant change in aircraft attitude).	x	x		x						
			DES			TAWS warning when deviating from planned descent routing, requiring immediate response	x			x	x					
			TO			Scenario immediately after take-off which requires an immediate and overweight landing			x	x	x					
			TO			Adverse wind, crosswinds with or without strong gusts on take-off	x			x						

Assessment and training topic		Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
EVAL or SBT			TO			Adverse weather, wind shear, wind shear encounter during take-off, with or without reactive warnings	x			x			x		
			TO			Engine failure during initial climb, typically 30-60 m (100-200 ft) (autopilot off)	x	x		x				x	
			CRZ			Wind shear encounter scenario during cruise, significant and rapid change in wind speed or down/updrafts, without wind shear warning	x		x			x	x	x	
			APP			Adverse weather, wind shear, wind shear encounter with or without warning during approach	x		x	x			x		
			APP			Adverse weather, deterioration in visibility or cloud base, or adverse wind, requiring a go-around from visual circling approach, during the visual segment	x	x	x	x		x	x	x	
			APP			Interception of the glide slope from above (correlation with unstable approach training)			x				x	x	
			APP LDG			Adverse wind, crosswinds with or without strong gusts on approach, final approach and landing (within and beyond limits)	x			x		x			
			APP LDG			Adverse weather, adverse wind, approach and landing in demanding weather conditions, e.g. turbulence, up and downdrafts, gusts and crosswinds including shifting wind directions				x		x	x		
			APP LDG			Circling approach manually flown at night in minimum in-flight visibility to ensure ground reference, minimum environmental lighting and no glide slope guidance lights	x			x			x	x	

Assessment and training topic		Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
			APP LDG			Runway incursion during approach, which can be triggered by ATC at various altitudes or by visual contact during the landing phase	x			x			x		
			LDG			Adverse wind, visibility, type-specific, special consideration for long-bodied aircraft, landing in minimum visibility for visual reference, with crosswind	x	x		x			x		
			LDG			System malfunction, auto flight failure at DA during a low-visibility approach requiring a go-around flown manually	x		x	x			x		
			APP LDG			Approach planned with autoland, followed by a failure below 1 000 ft requiring a manual go-around and an immediate landing due to fuel shortage	x		x		x		x		
			TO			In-seat instruction: Insufficient engine failure recovery, forcing the pilot monitoring to take over the flight controls		x		x			x	x	
			APP LDG			In-seat instruction: Unstable approach on short final or long landing, forcing the pilot monitoring to take over the flight controls		x		x			x	x	
EVAL or SBT	Monitoring, cross-checking, error management, mismanagement	A	ALL	The scenarios should be realistic and relevant, and should be used for the purpose of demonstration and reinforcement of effective monitoring.	Recognise mismanaged aircraft state. Observe the pilot's behaviour: how the pilot is mitigating errors, performing cross-checking, monitoring performance and	Deviations from the flight path, in pitch attitude, speed, altitude, bank angle		x					x		
			ALL			In-seat instruction: Simple automation errors (e.g. incorrect mode selection, attempted engagement without the necessary conditions, entering wrong altitude or speed, failure to execute the desired mode) culminating in a need for direct intervention		x					x		

Assessment and training topic		Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
	Managed aircraft state			Modules in the FSTD should be treated like those in an aircraft so that trainees have the opportunity to develop the competency with the practice of the right techniques and attitudes related to these topics through pilot performance, and that instructors have the opportunity to assess and train these topics in a realistic environment. As shown by the EBT data report, these topics are of key importance to improve safety in operations. In addition, the operator may also use these topics to develop scripted role-playing scenarios in the form of ISI. These scenarios cater for the need to monitor flight path excursions from the instructor pilot (PF), detect errors and make	dealing with a mismanaged aircraft state, in order to ensure that observed deviations, errors and mistakes are taken as learning opportunities throughout the programme. Monitor flight path excursions. Detect errors and threats through proper cross-checking performance. Make appropriate interventions either verbally or by taking control if applicable. Take appropriate action if necessary. Restore the desired aircraft state. Identify and manage consequences.	from the pilot monitoring, and where necessary taking control.									
			APP			In-seat instruction: Unstable approach or speed/path/vertical rate not congruent with the required state for the given flight condition	x	x					x	x	
			LDG			In-seat instruction: Demonstration exercise — recovery from bounced landing, adverse wind, strong gusts during landing phase, resulting in a bounce and necessitating recovery action from the pilot monitoring	x			x			x		

Assessment and training topic		Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
				appropriate interventions, either verbally or by taking control as applicable. Demonstration scenarios may also be used. Demonstrated role-play should contain realistic and not gross errors, leading at times to a mismanaged aircraft state, which can also be combined with upset management training.											
	Unstable approach	A	DES APP	Reinforce stabilised approach philosophy and adherence to defined parameters. Encourage go-arounds when crews are outside these parameters. Develop and sustain competencies related to the management of high-energy situations.		ATC or terrain-related environment creating a high-energy descent with the need to capture the optimum profile to complete the approach in a stabilised configuration	x		x				x		
			DES APP			ATC or terrain-related environment creating a high-energy descent leading to unstable conditions and requiring a go-around	x		x				x		
			APP			Approach and landing in demanding weather conditions, e.g. turbulence, up and downdrafts, gusts and crosswinds including shifting wind directions				x		x	x		
			APP			Increasing tailwind on final approach (not reported)	x	x				x	x		
			APP LDG			Crosswinds with or without strong gusts on approach, final approach and landing (within and beyond limits)	x			x		x			

Section 5 — UPRT training topic with frequency (B). Evaluation phase, manoeuvres training phase or scenario-based training phase (EVAL, MT or SBT)																
EVAL, MT or SBT	Upset prevention training	B	N/A	Compliance with AMC1 or AMC2 to ORO.FC.220&230 Include upset prevention elements in Table 1 for the recurrent training programme in at least every cycle, such that all the elements are covered over a period not exceeding 3 years. The elements are numbered with letters from A to I in Table 1 of AMC1 ORO.FC.220&230. Each element is made up of several numbered components. According to the principles of EBT, covering one component should satisfy the requirement to cover the whole element of recognising and preventing the development of upset conditions.	Early recognition and prevention of upset conditions. When the differences between LHS and RHS are not significant in the handling of the aircraft, UPRT may be conducted in either seat.	See Table 1 of AMC1 ORO.FC.220&230: Elements and respective components of upset prevention training.		Intentionally blank								
			CRZ			Demonstration of the defined normal flight envelope and any associated changes in flight instruments, flight director systems, and protection systems. This should take the form of an instructor-led exercise to show the crew the points beyond which an upset condition could exist.				X				x	x	
			TO APP			Severe wind shear or wake turbulence during take-off or approach				x	x		x	x		
			CRZ			As applicable and relevant to the aircraft type, demonstration at a suitable intermediate level, with turbulence as appropriate; practise steep turns and note the relationship between bank angle, pitch and stalling speed.					X			x		x
			CRZ			At the maximum cruise flight level for the current aircraft weight, turbulence to trigger overspeed conditions (if FSTD capability exists, consider use of the vertical wind component to add realism).		X		x	x			x		
			CRZ			At the maximum cruise flight level for the current aircraft weight, turbulence and significant temperature rise to trigger low-speed conditions (if FSTD capability exists, consider use of the vertical wind component to add realism).				X	x			x		X
			CRZ			High-altitude ACAS RA (where the RA is required to be flown in manual flight)		x			x			x	x	

Assessment and training topic	Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO	
Section 6 — Training topics with frequency (B) in alphabetical order. Evaluation phase or scenario-based training phase (EVAL or SBT)															
EVAL or SBT	Adverse wind	B	TO	Adverse wind/crosswind. This includes tailwind but not ATC mis-reporting of the actual wind.	Recognise adverse-wind conditions. Observe limitations. Apply the appropriate procedures. Maintain directional control and safe flight path.	Take-off with different crosswind/tailwind/gust conditions						x		x	
			TO			Take-off with unreported tailwind		x			x				
			TO			Crosswinds with or without strong gusts on take-off	x			x					
			APP			Wind exceeding limits on final approach (not reported)	x	x				x	x		
			APP			Wind exceeding limits on final approach (reported) in manual aircraft control	x	x		x		x			
			APP			Increasing tailwind on final approach (not reported)	x	x				x	x		
			APP			Approach and landing in demanding weather conditions, e.g. turbulence, up and downdrafts, gusts and crosswind including shifting wind directions				x		x	x		
			APP			Adverse-wind scenario resulting in increasing tailwind below DA (not reported)		x		x		x			
			APP			Adverse-wind scenario including strong gusts and/or crosswind out of limits below DA (not reported)		x		x		x			
			APP			Adverse-wind scenario including strong gusts and/or crosswind out of limits below 15 m (50 ft) (not reported)		x		x		x			
			APP LDG			Crosswind with or without strong gusts on approach, final approach and landing (within and beyond limits)	x			x		x			
			EVAL or			Aircraft system malfunc	B	ALL	Any internal failure(s) apparent or not apparent to the crew	Recognise system malfunction.	(i) System malfunctions that require immediate and urgent crew intervention or decision, e.g. fire, smoke, loss of pressurisation at high altitude,				
Intentionally blank															

Page 596 of 2314 | Dec 2022

Assessment and training topic		Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
EVAL or SBT	Aircraft system management	B		Normal system operation according to defined instructions	This is not considered as a stand-alone topic. It is linked with the topic 'compliance'. Where a system is not managed according to normal or defined procedures, this is determined as a non-compliance.	See 'compliance' topic above. There are no defined scenarios, but the instructor should focus on learning opportunities when system management non-compliances manifest themselves during other scenarios. Underpinning knowledge of systems and their interactions should be developed and challenged, and not merely the application of normal procedures.	Intentionally blank								X
			CRZ APP LDG			Minimum fuel, caused by extended delays, weather, etc. where the crew would need to manage a minimum fuel situation.					X	x	x	x	
	Approach , visibility close to minimum	B	APP	Any situation where visibility becomes a threat	Recognise actual conditions. Observe aircraft and/or procedural limitations. Apply the appropriate procedures if applicable. Maintain directional control and safe flight path.	Approach in poor visibility	x		x	x				x	
			APP			Approach in poor visibility with deteriorations necessitating a decision to perform a go-around	x		x	x					
			LDG			Landing in poor visibility				x		x	x		

Assessment and training topic		Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
	Landing	B	LDG	Pilots should have opportunities to practise landings in demanding situations at the defined frequency. Data indicates that landing problems have their roots in a variety of factors, including inappropriate decision-making, in addition to manual aircraft control skills if difficult environmental conditions exist. The purpose of this item is to ensure that pilots are exposed to this during the programme.	Landing in demanding environmental conditions, with malfunctions as appropriate	This topic should be combined with the adverse-weather topic, aircraft system malfunctions topic or any topic that can provide exposure to a landing in demanding conditions.	Intentionally blank								
	Runway or taxiway condition	B	GND TO LDG	Contamination or surface quality of the runway, taxiway, or tarmac including foreign objects	Recognise hazardous runway condition. Observe limitations. Take appropriate action. Apply the appropriate procedures correctly. Assure aircraft control.	Planned anticipated hazardous conditions with dispatch information provided to facilitate planning and execution of appropriate procedures						x			X
			GND TO LDG			Unanticipated hazardous conditions, e.g. unexpected heavy rain resulting in flooded runway surface		x			x	x			
			TO			Take-off on runway with reduced cleared width due to snow	x			x	x		x		
			TO			Stop/go decision in hazardous conditions					x	x		x	

Assessment and training topic		Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
EVAL or SBT	Surprise	B	TO	<p>The data analysed during the development of the EBT concept indicated substantial difficulties encountered by crews when faced with a threat or error, which was a surprise or an unexpected event. The element of surprise should be distinguished from what is sometimes referred to as the ‘startle factor’ — the latter being a physiological reaction. Wherever possible, consideration should be given towards variations in the types of scenario, times of occurrences and types of occurrence, so that pilots do not become overly familiar with repetitions of the same scenarios. Variations should be the focus of EBT programme design, and not left to the discretion of individual instructors, in order to preserve programme integrity and fairness.</p>	<p>Exposure to an unexpected event or sequence of events at the defined frequency in order to build resilience.</p>	Rejected take- off	X			X		X			
EVAL or SBT			ALL			Intentionally blank	Intentionally blank								

EVAL or SBT	Terrain	B	ALL	Alert, warning, or conflict	Anticipate terrain threats. Prepare for terrain threats. Recognise unsafe terrain clearance. Take appropriate action. Apply the appropriate procedures correctly. Maintain aircraft control. Restore safe flight path. Manage consequences.	ATC clearance giving insufficient terrain clearance	x	x			x				X
			ALL			Demonstration of terrain avoidance warning systems (TAWS) (this scenario element may be done in an ISI.)						x	x	x	
			TO CLB			Engine failure where performance is marginal leading to TAWS warning		x		x				x	
			DES APP			ATC provides a wrong QNH		x					x		
			DES			'Virtual mountain' refers to the surprise element of an unexpected warning. Care should be exercised in creating a level of realism, so this can best be achieved by an unusual and unexpected change of route during the descent.						X	x	x	
	Workload, distraction, pressure, stress	B	ALL	This is not considered a topic for specific attention on its own, but more as a reminder to programme developers to ensure that pilots are exposed to immersive training scenarios which expose them to manageable high workload and distractions during the course of the EBT programme, at the defined frequency.	Manage available resources efficiently to prioritise and perform tasks in a timely manner under all circumstances	Intentionally blank	Intentionally blank								

Assessment and training topic		Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTV	PSD	SAW	WLM	KNO
Section 7 — UPRT Upset recovery training topic with frequency (C). Manoeuvres training phase or scenario-based training phase (MT or SBT)															
MT or SBT	Upset recovery	C	N/A	Compliance with AMC1 or AMC2 to ORO.FC.220&230 Include the recovery exercises in Table 2 of AMC1 ORO.FC.220&230 for the recurrent training programme, such that all the exercises are covered over a period not exceeding 3 years. According to the principles of EBT, covering one component should satisfy the requirement to cover the whole element of recovery from developed upsets. The same principles apply to the exercises of components 2, 3 and 4 where one exercise may satisfy the requirement to cover the whole component. An aeroplane upset is defined as an undesired aeroplane state in flight characterised by	Recognise upset condition. Make timely and appropriate intervention. Take appropriate action. Assure timely and appropriate intervention. (AMC1 ORO.FC.220&230 Table 2 component 1) Assure aircraft control. Maintain or restore a safe flight path. Assess consequential issues. Manage outcomes. Consolidate the summary of aeroplane recovery techniques. (AMC1 ORO.FC.220&230 Table 2 component 5) Note: The operator should assess if the exercises should be practised for the either seat qualification.	The example scenario elements may be done in ISI, as non-ISI or a combination of both. If done in ISI: The instructor should position the aircraft within but close to the edge of the validated training envelope before handing control to the trainee to demonstrate the restoration of normal flight. Careful consideration should be given to flying within the validated training envelope. Table 2 of AMC1 ORO.FC.220&230: Exercises for upset recovery training A. Recovery from developed upsets	Intentionally blank								
			CLB DES			2. Recovery from stall events in the following configurations: take-off configuration, clean configuration low altitude, clean configuration near maximum operating altitude, and landing configuration during the approach phase.	x			x			x	x	
			CRZ			3. Recovery from nose high at various bank angles	x			x			x	x	
			CRZ			4. Recovery from nose low at various bank angles	x			x			x	x	
			CRZ												
			APP			Demonstration at a normal cruising altitude. Set conditions and disable aircraft systems as necessary to enable trainee to perform stall recovery according to OEM instructions.	x			x			x		
			CLB DES			Demonstration at an intermediate altitude during early stages of the approach. Set conditions and	x			x			x		

Assessment and training topic	Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
			unintentional divergences from parameters normally experienced during line operations or training. An aeroplane upset may involve pitch and/or bank angle divergences as well as inappropriate airspeeds for the conditions.		disable aircraft systems as necessary to enable trainee to perform stall recovery according to OEM instructions.									
					Recovery from a wake turbulence position with high-bank angle	x		x	x			x

			APP			Engine malfunction	x					x		x	
			CRZ			Engine failure in cruise (with autopilot)	x		x				x		
			CRZ			Multiple engine failure in CRZ (volcanic ash, recoverable). Competency FPM may or may not be included depending on the impact on the automation.					x	x	x	x	
			LDG			Engine failure or engine malfunction on landing				x					
EVAL or SBT	Fire and smoke management	C	GND	This includes engine, electric, pneumatic, cargo fire, smoke or fumes.	Recognise fire, smoke or fumes. Take appropriate action. Apply the appropriate procedure correctly. Maintain aircraft control. Manage consequences.	Fire in cargo or cabin/cockpit at gate	x	x				x		x	
			GND			Fire during taxi	x	x				x		x	X
			GND			Fire with no cockpit indication	x	x				x		x	X
			TO			Take-off low speed	x			x	x	x			X
			TO			Fire or smoke on take-off high speed below V1	x			x	x	x			
			TO			Fire or smoke on take-off high speed above V1	x				x	x			
			TO			Fire or smoke on initial climb	x				x	x			
			CRZ			Cargo compartment fire or avionics compartment fire						x	x	x	
			APP			Engine fire in approach (extinguishable)		x				x			
			APP			Engine fire in approach (non-extinguishable)		x			x	x			
			CLB			Lithium battery fire in the cockpit or cabin compartment	x	x			x	x		x	
			CRZ												
			DES			Flight deck or cabin fire		x			x	x			X
			APP												

Assessment and training topic		Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
			GND			Any of the example scenario elements above ending in an evacuation		x			x	x		x	
	Loss of communications	C	GND	Lost or difficult communications due to either pilot mis-selection or a failure external to the aircraft. This could be for a few seconds or a total loss.	Recognise loss of communications. Take appropriate action. Execute the appropriate procedure as applicable. Use alternative ways to communicate. Manage consequences.	Loss of communications during ground manoeuvring	x	x							
			TO			Loss of communications after take-off	x					x			X
			APP			Loss of communications during approach phase, including go-around	x	x				x	x		X

Assessment and training topic		Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
EVAL or SBT	Managing loading, fuel, performance errors	C	ALL	A calculation error by one or more pilots, or someone involved with the process, or the process itself, e.g. incorrect information on the load sheet	Anticipate the potential for errors in load/fuel/performance data. Recognise inconsistencies. Manage/avoid distractions. Make changes to paperwork/aircraft system(s) to eliminate error. Identify and manage consequences.	This can be a demonstrated error, in that the crew may be instructed to deliberately insert incorrect data — for example, to take off from an intersection with full-length performance information. The crew will be asked to intervene when acceleration is sensed to be lower than normal, and this may be part of the operator procedures, especially when operating mixed fleets with considerable variations in MTOM.	x	x						x	
			TO			Wind report with take-off clearance not consistent with prior performance calculation. ATC, cabin crew or other people are pushing crew to take off quickly.	x				x		x	x	

Assessment and training topic		Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTV	PSD	SAW	WLM	KNO
			GND			Environmental change during taxi (e.g. heavy rain) not consistent with prior take-off performance calculation							x	x	
			GND			Fuel ground staff on industrial action. Only limited amount of fuel available, which is below the calculated fuel for the flight.					x	x	x	x	
			GND			Advise crew that there is a change of the load sheet figures during taxi to the runway. The crew may have limited time due to a calculated take-off time (CTOT) — ATC Slot.	x							x	
			GND			Braking action reported 'medium'. The information is transmitted just before take-off. The flight is subject to a CTOT — ATC slot.					x		x	x	
	Navigation	C	GND	External NAV failure. Loss of GPS satellite, ANP exceeding RNP, loss of external NAV source(s)	Recognise a NAV degradation. Take appropriate action. Execute the appropriate procedure as applicable. Use alternative NAV guidance. Manage consequences.	External failure or a combination of external failures degrading aircraft navigation performance on ground	x		x			x	x		
			TO CLB APP LDG			External failure or a combination of external failures degrading aircraft navigation performance in flight		x			x	x	x		
			GND			Standard initial departure change during taxi. The flight may be subject to a CTOT — ATC slot.					x		x	x	
			APP			Loss of runway lighting below decision height		x				x	x		
			CRZ			No fly zone: when the crew changes control frequency, the new ATCO informs the crew that they are flying over an unannounced 'no fly zone' that is not included in the NOTAMS. (To trigger such an event, the context may be as follows: an unexpected military conflict in the territory the aircraft is flying over or the crew is forced to re-route in flight and the new route flies over a city					x	x	x		

Assessment and training topic		Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
						that has an important event such the Olympic games, a G20/G7 submit, or the route is flying near a space rocket launch close to the time of the launch, like the Guiana Space Centre, Cape Cañaveral, etc.).									
	Operations - or type-specific	C	ALL	Intentionally blank	Intentionally blank	Intentionally blank	Intentionally blank								
	Operations of special airport approval	C	APP LDG	See equivalency of approaches relevant to operations.	The operator should comply with the national qualification requirements published in the aeronautical information publication (AIP).	Intentionally blank	Intentionally blank								
	Pilot incapacitation	C	TO	Consequences for the non-incapacitated pilot	Recognise incapacitation. Take appropriate action including correct stop/go decision. Apply the appropriate procedure correctly. Maintain aircraft control. Manage consequences.	During take-off	x	x			x	x			X
			APP			During approach	x			x				x	X
	Traffic	C	CLB CRZ DES	Traffic conflict. ACAS RA or TA, or visual observation of conflict, which requires evasive manoeuvring	Anticipate potential loss of separation. Recognise loss of separation. Take appropriate action. Apply the appropriate procedure correctly. Maintain aircraft control.	ACAS warning that requires crew intervention		x				x	x	x	
						Dilemma: Visual acquisition of conflicting traffic followed by an ACAS warning (resolution advisory) triggered by the same or other traffic. Even if the traffic is in sight, the pilot should follow the RA.	x		x	x					
						While in descent, ACAS warning (traffic advisory) of an aircraft below. The crew should	x				x	x			

Assessment and training topic		Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTV	PSD	SAW	WLM	KNO
	Wind shear recovery	C	APP	With or without warnings including predictive. A wind shear scenario is ideally combined with an adverse-weather scenario containing other elements.	Anticipate potential for wind shear. Avoid known wind shear or prepare for suspected wind shear. Recognise wind shear encounter. Take appropriate action. Apply the appropriate procedure correctly. Assure aircraft control. Recognise out of wind shear condition. Maintain or restore a safe flight path. Assess consequential issues and manage outcomes.	not initiate an avoidance manoeuvre based on TA (except decreasing the rate of descent unless otherwise instructed by ATC, etc.). This example scenario can be done during climb with conflicting traffic above.									
						Predictive wind shear warning during take-off					x	x			
						Wind shear encounter during take-off	x				x	x			
						Wind shear encounter after rotation						x		x

AMC3 ORO.FC.232 EBT programme assessment and training topics

ED Decision 2022/014/R

GENERATION 3 (JET) — TABLE OF ASSESSMENT AND TRAINING TOPICS

Assessment and training topic		Frequency	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Flight phase activation	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTV	PSD	SAW	WLM	KNO
Generation 3 Jet — Recurrent assessment and training matrix							Competency map								
Section 1 — Skill retention. Manoeuvres training phase (MT)															
MT	Rejected take-off	B	Rejected take-off after the application of take-off thrust and before reaching V1 (CAT I or above)	Demonstrate manual aircraft control skills with smoothness and accuracy as appropriate to the situation. Detect deviations through instrument scanning. Maintain spare mental capacity during manual aircraft control. Maintain the aircraft within the flight envelope. Apply knowledge of the relationship between aircraft attitude, speed and thrust.	TO	From initiation of take-off to complete stop (or as applicable to the procedure)	x			x					
	Failure of the critical engine between V1 and V2	A	Failure of the critical engine from V1 and before reaching V2 in the lowest CAT I visibility or in LVO meteorological (MET) conditions.		TO	The manoeuvre is complete at a point when the aircraft is stabilised at normal engine-out climb speed with the correct pitch and lateral control, in trim condition and, as applicable, autopilot engagement. Only one failure of the critical engine between V1 and V2 a year may be done in LVO conditions.	x			x					
	Failure of one engine on take-off	B	Failure of one engine from V1 and before reaching V2 in the lowest CAT I visibility or in LVO MET conditions.		TO	The manoeuvre is complete at a point when the aircraft is stabilised in a clean configuration with engine-out procedures completed. Only one failure of the critical engine between V1 and V2 a year may be done in LVO conditions.	x			x					
			Failure of one engine above V2 (any segment of the TO) in the lowest CAT I visibility or in LVO MET conditions.			The manoeuvre is complete at a point when the aircraft is stabilised in a clean configuration with engine-out procedures completed.	x		x	x					

Assessment and training topic		Frequency	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Flight phase activation	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNOWLEDGE
	Emergency descent	C	Initiation of emergency descent from normal cruise altitude		CRZ	The manoeuvre is complete once the aircraft is stabilised in emergency descent configuration (and profile). However, if the EBT programme does not include the example scenario element ‘emergency descent’ in the training topic ‘automation management’, the emergency descent procedures should be completed and should not stop once the aircraft is stabilised in emergency descent configuration.	x		x	x					
	Engine-out approach & landing	B	With the critical engine (if applicable) failed, normal landing		LDG	Initiation in a stabilised engine-out configuration from not less than 3 NM final approach, until completion of roll-out	x			x					
	Engine-out approach & go-around	B	With the critical engine (if applicable) failed, manually flown normal precision approach to DA, followed by a manual go-around — the whole manoeuvre to be flown without visual reference		APP	This manoeuvre should be flown from intercept to centreline until acceleration after go-around. The manoeuvre is complete at a point when the aircraft is stabilised at normal engine-out climb speed with the correct pitch and lateral control, in trim condition and, as applicable, autopilot engagement (describe generally the critical part of the manoeuvre).	x			x					
	Go-around	A	Go-around, all engines operative		APP	High energy, initiation during the approach at 150 to 300 m (500 to 1 000 ft) below the missed approach level-off altitude	x		x	x					
						Initiation of a go-around from DA followed by visual circuit and landing	x		x	x					
						During flare/rejected landing	x		x	x					
	Pilot qualification to	B	As per ORO.FC.235		APP	Complete the manoeuvres mandated in ORO.FC.235.	Intentionally left in blank.								

Assessment and training topic	Frequency	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Flight phase activation	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
operate in either pilot's seat														

Assessment and training topic	Frequency	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Flight phase activation	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	WNO
Generation 3 Jet — Recurrent assessment and training matrix						Competency map								
Section 2 — Equivalency of approaches relevant to operations. Evaluation phase, manoeuvres training phase or scenario-based training phase (EVAL, MT or SBT)														
MT	Approach type A or B	B	Approach type A or B flight method 3D	See equivalency of approaches relevant to operations that place an additional demand on a proficient crew	APP	See equivalency of approaches relevant to operations	X		X	X		X		X
	Approach type A	B	Approach type A flight method 2D	See equivalency of approaches relevant to operations that place an additional demand on a proficient crew	APP	See equivalency of approaches relevant to operations	X		X	X		X		X
EVAL or SBT	Approach type A	B	Approach type A flight method 3D or 2D	See equivalency of approaches relevant to operations that place an additional demand on a proficient crew	APP	See equivalency of approaches relevant to operations	X		X	X		X		X
	Approach type B	B	Approach type B flight method 3D	See equivalency of approaches relevant to operations that place an additional demand on a proficient crew	APP	See equivalency of approaches relevant to operations	X		X	X		X		X

Assessment and training topic		Frequency	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Flight phase activation	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
Section 3 – Equivalency of approaches under specific approvals and take-off under specific approvals. Evaluation phase, manoeuvres training phase or scenario-based training phase (EVAL, MT or SBT)															
MT	SPA approach(es)	B	Approach requiring specific approval	See equivalency of approaches relevant to operations — specific approval	APP	Approaches flown from FAF to landing or go-around	x		x	x					
EVAL or SBT	SPA approach(es)	B	Approach requiring specific approval	See equivalency of approaches relevant to operations — specific approval	APP	Approaches flown from FAF to landing or go-around	x		x	x					
EVAL, MT or SBT	SPA Rejected take-off (RTO)	B	Engine failure after the application of take-off thrust and before reaching V1 (in low-visibility MET conditions, preferably in the lowest approved visibility) Low-visibility RTO is not required under Part SPA but instead in Appendix 9 Section 6. Note: AMC1 SPA.LVO.120 point (f) does not require a low-visibility RTO. RTO is required only in the initial LVO course (point (g)(1)(iii) of AMC1 SPA.LVO.120).	Demonstrate manual aircraft control skills with smoothness and accuracy as appropriate to the situation. Detect deviations through instrument scanning. Maintain spare mental capacity during manual aircraft control. Maintain the aircraft within the flight envelope. Apply knowledge of the relationship between aircraft attitude, speed and thrust.	TO	RTO — can be combined with the assessment and training topic ‘surprise’ in EVAL or SBT	x			x					

Assessment and training topic		Frequency	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Flight phase activation	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
EVAL, MT or SBT	LVTO	B	Notwithstanding AMC1 SPA.LVO120 point (f)(1)		TO	The manoeuvre is complete at a point when the aircraft is stabilised at normal climb speed with the correct pitch and lateral control, in trim condition and, as applicable, autopilot engagement.	x			x					
			AMC1 SPA.LVO.120 requires SPA manoeuvres in the frequency of the OPC, as OPC is substituted in the EBT programme. Thus, the frequency in EBT is determined in every cycle (B). Low visibility take-off, preferably in the lowest approved visibility												

Assessment and training topic	Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO	
Generation 3 Jet — Recurrent assessment and training matrix						Competency map									
Section 4 — Training topics with frequency (A) in alphabetical order. Evaluation phase or scenario-based training phase (EVAL or SBT).															
EVAL or SBT	Adverse weather	A	GND	Thunderstorm, heavy rain, turbulence, ice build-up to include de-icing issues, as well as high-temperature conditions.	Anticipate adverse weather. Prepare for suspected adverse weather. Recognise adverse weather.	Predictive wind shear warning before take-off, as applicable	x	x				x			
			ALL			Adverse-weather scenario, e.g. thunderstorm activity, precipitation, icing		x			x	x		x	
			TO			Wind shear encounter during take-off, not predictive	x			x			x		X
			TO			Predictive wind shear warning during take-off	x	x				x	x		
			TO			Crosswinds with or without strong gusts on take-off	x			x					

Assessment and training topic		Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
			CRZ	The proper use of anti-ice and de-icing systems should be included generally in appropriate scenarios.	Take appropriate action. Apply the appropriate procedure correctly. Assure aircraft control.	Turbulence that increases to severe turbulence		x			x		x	x	
			CRZ			Wind shear encounter scenario during cruise	x		x			x	x	x	
			APP			Reactive wind shear warning during approach or go-around	x		x	x			x		
			APP			Predictive wind shear warning during approach or go-around	x	x				x	x		
			APP			Thunderstorm encounter during approach or on missed approach	x					x	x		
			APP			Increasing tailwind on final approach (not reported)	x	x				x	x		
			APP			Approach and landing in demanding weather conditions, e.g. turbulence, up and downdrafts, gusts and crosswinds including shifting wind directions				x		x	x		
			APP			Non-precision approach in cold-temperature conditions, requiring altitude compensation for temperature, as applicable to the type	x	x					x		
			APP LDG			Crosswinds with or without strong gusts on approach, final approach and landing (within and beyond limits)	x			x		x			
			APP			In approach, unexpected braking action 'good to medium' reported by the preceding aircraft		x				x	x	x	
			APP			Moderate to severe icing conditions during approach effecting aircraft performance	x	x				x	x		
			APP			Reduced visibility even after acquiring the necessary visual reference during approach, due to rain or fog	x	x				x			
EVAL or SBT	Automation management	A	CLB CRZ DES APP	The purpose of this topic is to encourage and develop effective flight path management through proficient and appropriate use of the	Know how and when to use the flight management system(s), guidance and automation. Demonstrate correct methods for	ACAS warning (resolution advisory), recovery and subsequent engagement of automation	x		x						
			ALL			FMS tactical programming issues, e.g. step climb, runway changes, late clearances, destination re-programming, executing diversion	x		x						X

Assessment and training topic	Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
		CLB CRZ DES APP	flight management system(s), guidance and automation, including transitions between modes, monitoring, mode awareness, vigilance and flexibility needed to change from one mode to another. The means of mitigating errors are included in this topic. The errors are described as mishandled auto flight systems, inappropriate mode selection, mishandled flight management system(s) and inappropriate autopilot usage.	engagement and disengagement of the auto flight system(s). Demonstrate appropriate use of flight guidance, auto thrust and other automation systems. Maintain mode awareness of the auto flight system(s), including engagement and automatic transitions. Revert to different modes when appropriate. Detect deviations from the desired aircraft state (flight path, speed, attitude, thrust, etc.) and take appropriate action. Anticipate mishandled auto flight system. Recognise mishandled auto flight system.	Recoveries from TAWS, management of energy state to restore automated flight	x		x	x					
		CLB CRZ DES APP			Amendments to ATC cleared levels during altitude capture modes to force mode awareness and intervention	x		x				x		
		TO			ACAS warning (resolution advisory to level off) during climb or descent; for example, close to the cleared level when the capture mode has already been activated.	x		x				x		
		TO APP			Late ATC clearance to an altitude below acceleration altitude	x		x				x		
		CRZ			Engine-out special terrain procedures	x		x				x		
		CLB			Forcing autopilot disconnect followed by re-engagement, recovery from low- or high-speed events in cruise	x		x	x			x		
		CRZ			Engine failure during or after initial climb using automation	x		x						
		CRZ			Engine failure in cruise to onset of descent using automation	x		x						
		CRZ			Emergency descent	x		x						X
		DES APP			Managing high-energy descent capturing descent path from above (correlation with unstable approach training)	x		x				x		X
		APP			No ATC clearance received prior to commencement of approach or final descent	x		x				x		
		APP			Reactive wind shear and recovery from the consequent high-energy state	x		x				x		

Assessment and training topic		Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
EVAL or SBT			APP		Take appropriate action if necessary. Restore correct auto flight state. Identify and manage consequences.	Automation fail to capture the approach altitude in descent (e.g. last altitude before the FAP). Ideally, the failure occurs when the workload is high (e.g. configuration of the aircraft for final approach).					x	x	x	x	
			APP			Non-precision or infrequently flown approaches using the maximum available level of automation	x		x						X
			APP			Gear malfunction during an approach planned with autoland (including autobrake). Competency FPA may or may not be included depending on the impact of such malfunction on the automation.		x	x			x		x	
			APP			ATC clearances to waypoints beyond the programmed descent point for a coded final descent point during an approach utilising a final descent that is commanded by the flight management system.	x		x				x		X
	Competencies — non-technical (CRM)	A	APP	This encapsulates the general CRM principles and objectives. It includes communication; leadership and teamwork; problem-solving and decision-making; situation awareness and management of information; and workload management.	Exposure to an event or sequence of events to allow the pilot to build awareness of human factors in aviation and the human limitations. This includes the development of the following competencies: Communication: Demonstrate: — effective use of language;	GPS failure prior to commencement of approach associated with position drift and a terrain alert					x	x	x		X
			DES			Cabin crew report of water noise below the forward galley indicating a possible toilet pipe leak, with consequent avionics failures					x	x	x		
			CRZ			Smoke removal but combined with a diversion until landing is completed.		x			x	x	x	x	X
			GND			Apron fuel spilling					x	x		x	
			CRZ			Important water leak in an aircraft galley		x			x	x		x	
			ALL			A relevant number of cabin crew are wounded or incapacitated. Additionally, the cabin crew wounded or incapacitated are the most competent (e.g. senior cabin crew member).					x	x		x	
			ALL			Unruly passenger(s)					x			x	
			GND			Passenger oxygen: passenger service unit open and mask falling down					x	x		x	

Assessment and training topic		Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
EVAL or SBT			ALL	Emphasis should be placed on the development of leadership, shown by EBT data sources to be a highly effective competency in mitigating risk and improving safety through pilot performance.	<ul style="list-style-type: none"> — responsiveness to feedback; and — capability to state the plans and resolve ambiguities. Leadership and teamwork: Use appropriate authority to ensure focus on the task. Support others in completing tasks. Problem-solving and decision-making: Detect deviations from the desired state, evaluate problems, identify the risk, consider alternatives and select the best course of action. Continuously review progress and adjust plans. Situation awareness and management of information: Have an awareness of the aircraft state in its environment; project	Passenger with medical problems — medical emergency					x			x	
			CRZ			Credible threat reported to the crew. Stowaway or fugitive on board.		x			x		x	x	
			GND			No METAR or TAFOR is available for destination due to industrial action at the destination airport.	x	x			x	x			
			CRZ			Credible bomb threat reported to crew		x			x		x	x	
			CLB DES			Credible bomb threat or pressurisation problem, but no quick landing possible (due to weather, terrain or other reasons)		x			x	x		x	
			APP			Diversion with low remaining fuel or increased fuel flow due to system malfunction	x				x		x	x	
			APP			ACAS warning (resolution advisory) immediately following a go-around, with a descent manoeuvre required. (The RA should be a command for descent when the aircraft is above 1 100 ft AGL.)		x			x	x	x	X	

Assessment and training topic		Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNOWLEDGE
					and anticipate changes. Workload management: Prioritise, delegate and receive assistance to maximise focus on the task. Continuously monitor the flight progress.										
EVAL or SBT	Compliance	A	ALL	Compliance failure. Consequences of not complying with operating instructions (e.g. SOPs). This is not intended to list example scenario elements, but instructors should ensure that observed non-compliances are taken as learning opportunities throughout the programme. In all modules of the programme, the FSTD should as far as possible be treated like	Recognise that a compliance failure has occurred. Make a verbal announcement. Take appropriate action if necessary. Restore safe flight path if necessary. Manage consequences.	The following are examples of potential compliance failures and are not intended to be developed as scenarios as part of an EBT mod: 1. Requesting flap beyond limit speed 2. Flaps or slats in the wrong position for phase of flight or approach 3. Omitting an action as part of a procedure 4. Failing to initiate or complete a checklist 5. Using the wrong checklist for the situation	Intentionally blank								

Assessment and training topic		Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
				an aircraft, and non-compliances should not be accepted simply for expediency.											
EVAL or SBT	Go-around management	A	APP	Any threat or error that can result in circumstances that require a decision to perform a go-around, in addition to the execution of the go-around. Go-around scenarios should be fully developed to encourage effective leadership and teamwork, in addition to problem-solving and decision-making, plus execution using manual aircraft control or the flight management system(s) and automation as applicable. Design should include the element of surprise, and scenario-based go-		Adverse-weather scenario leading to a reactive wind shear warning during approach	x	x					x	x	
			APP			Adverse-weather scenario leading to a predictive wind shear warning during approach or go-around	x	x					x	x	
			APP			Adverse-weather scenario, e.g. thunderstorm activity, heavy precipitation or icing forcing decision at or close to DA/MDA	x					x	x	x	
			APP			DA with visual reference in heavy precipitation with doubt about the runway surface braking capability	x					x	x	x	
			APP			Adverse-wind scenario resulting in increasing tailwind below DA (not reported)		x		x		x			
			APP			Adverse-wind scenario including strong gusts and/or crosswind out of limits below DA (not reported)		x		x		x			
			APP			Adverse-wind scenario including strong gusts and/or crosswind out of limits below 15 m (50 ft) (not reported)		x		x		x			
			APP			Lost or difficult communications resulting in no approach clearance prior to commencement of approach or final descent	x		x				x		
			APP			Birds: large flocks of birds below DA once visual reference has been established				x		x	x		
			APP			System malfunction, landing gear malfunction during the approach									

Assessment and training topic		Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
				arounds should not be predictable and anticipated. This topic is completely distinct from the go-around manoeuvre listed in the MT section that is intended only to practise psychomotor skills and a simple application of the procedures.											
EVAL or SBT	Manual aircraft control	A	CLB CRZ DES APP	Controls the flight path through manual control	Demonstrate manual aircraft control skills with smoothness and accuracy as appropriate to the situation. Detect deviations through instrument scanning. Maintain spare mental capacity during manual aircraft control. Maintain the aircraft within the normal flight envelope. Apply knowledge of the relationship between aircraft	Flight with unreliable airspeed, which may or may not be recoverable	x			x			x		X
			CLB CRZ DES APP			Alternate flight control modes according to malfunction characteristics	x			x				x	X
			CLB CRZ DES APP			ACAS warning (resolution advisory) requires the pilot to descend or ATC calls for immediate descent (preferably during climb which requires a significant change in aircraft attitude)	x	x		x					
			CLB CRZ DES APP			ACAS warning (resolution advisory) requires the pilot to climb or ATC calls for immediate climb (preferably during descent which requires a significant change in aircraft attitude).	x	x		x					
			DES			TAWS warning when deviating from planned descent routing, requiring immediate response	x			x	x				

Assessment and training topic		Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
EVAL or SBT			TO		attitude, speed and thrust.	Scenario immediately after take-off which requires an immediate and overweight landing			x	x	x	x			
			TO			Adverse wind, crosswinds with or without strong gusts on take-off	x			x					
			TO			Adverse weather, wind shear, wind shear encounter during take-off, with or without reactive warnings	x			x			x		
			TO			Engine failure during initial climb, typically 30-60 m (100-200 ft) (autopilot off)	x	x		x				x	
			CRZ			Wind shear encounter scenario during cruise, significant and rapid change in wind speed or down/updrafts, without wind shear warning	x		x			x	x	x	
			APP			Adverse weather, wind shear, wind shear encounter with or without warning during approach	x		x	x			x		
			APP			Adverse weather, deterioration in visibility or cloud base, or adverse wind, requiring a go-around from visual circling approach, during the visual segment	x	x	x	x		x	x	x	
			APP			Interception of the glide slope from above (correlation with unstable approach training)			x				x	x	
			APP LDG			Adverse wind, crosswinds with or without strong gusts on approach, final approach and landing (within and beyond limits)	x			x		x			
			APP LDG			Adverse weather, adverse wind, approach and landing in demanding weather conditions, e.g. turbulence, up and downdrafts, gusts and crosswinds including shifting wind directions				x		x	x		
			APP LDG			Circling approach manually flown at night in minimum in-flight visibility to ensure ground reference, minimum environmental lighting and no glide slope guidance lights	x			x			x	x	

Assessment and training topic		Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
			APP LDG			Runway incursion during approach, which can be triggered by ATC at various altitudes or by visual contact during the landing phase	x			x			x		
			LDG			Adverse wind, visibility, type-specific, special consideration for long-bodied aircraft, landing in minimum visibility for visual reference, with crosswind	x	x		x			x		
			LDG			System malfunction, auto flight failure at DA during a low-visibility approach requiring a go-around flown manually	x		x	x			x		
			APP LDG			Approach planned autoland, followed by a failure below 1 000 ft requiring a manual go-around and an immediate landing due to fuel shortage	x		x		x		x		
			TO			In-seat instruction: Insufficient engine failure recovery, forcing the pilot monitoring to take over the flight controls		x		x			x	x	
			APP LDG			In-seat instruction: Unstable approach on short final or long landing, forcing the pilot monitoring to take over the flight controls		x		x			x	x	
EVAL or SBT	Monitoring, cross-checking, error management, mismanaged	A	ALL	The scenarios should be realistic and relevant, and should be used for the purpose of demonstration and reinforcement of effective monitoring.	Recognise mismanaged aircraft state. Observe the pilot's behaviour: how the pilot is mitigating errors, performing cross-checking, monitoring performance and	Deviations from the flight path, in pitch attitude, speed, altitude, bank angle		x					x		
			ALL			In-seat instruction: Simple automation errors (e.g. incorrect mode selection, attempted engagement without the necessary conditions, entering wrong altitude or speed, failure to execute the desired mode) culminating in a need for direct intervention from the pilot monitoring, and where necessary taking control.		x					x		
			APP			In-seat instruction:	x	x					x	x	

Assessment and training topic	Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
aircraft state			Modules in the FSTD should be treated like those in an aircraft so that trainees have the opportunity to develop the competency with the practice of the right techniques and attitudes related to these topics through pilot performance, and that instructors have the opportunity to assess and train these topics in a realistic environment. As shown by the EBT data report, these topics are of key importance to improve safety in operations.	dealing with a mismanaged aircraft state, in order to ensure that observed deviations, errors and mistakes are taken as learning opportunities throughout the programme. Monitor flight path excursions. Detect errors and threats through proper cross-checking performance. Make appropriate interventions either verbally or by taking control if applicable. Take appropriate action if necessary. Restore the desired aircraft state. Identify and manage consequences.	Unstable approach or speed/path/vertical rate not congruent with the required state for the given flight condition									
		LDG	In addition, the operator may also use these topics to develop scripted role-playing scenarios in the form of ISI. These scenarios cater for the need to monitor flight path		In-seat instruction: Demonstration exercise — recovery from bounced landing, adverse wind, strong gusts during landing phase, resulting in a bounce and necessitating recovery action from the pilot monitoring	x			x			x		

Assessment and training topic		Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
				excursions from the instructor pilot (PF), detect errors and make appropriate interventions, either verbally or by taking control as applicable. Demonstration scenarios may also be used. Demonstrated role-play should contain realistic and not gross errors, leading at times to a mismanaged aircraft state, which can also be combined with upset management training.											
	Unstable approach	A	DES APP	Reinforce stabilised approach philosophy and adherence to defined parameters.		ATC or terrain-related environment creating a high-energy descent with the need to capture the optimum profile to complete the approach in a stabilised configuration	x		x				x		
			DES APP	Encourage go-arounds when crews are outside these parameters.		ATC or terrain-related environment creating a high-energy descent leading to unstable conditions and requiring a go-around	x		x				x		
			APP	Develop and sustain competencies related		Approach and landing in demanding weather conditions, e.g. turbulence, up and downdrafts, gusts and crosswinds including shifting wind directions				x		x	x		
			APP			Increasing tailwind on final approach (not reported)	x	x				x	x		

Assessment and training topic	Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO

				instrumentation should be in the role of pilot flying and the others may be in the role of pilot flying or pilot monitoring. For full details, see the malfunction equivalency methodology.											
EVAL or SBT	Aircraft system management	B	N/A	Normal system operation according to defined instructions	This is not considered as a stand-alone topic. It is linked with the topic 'compliance'. Where a system is not managed according to normal or defined procedures, this is determined as a non-compliance.	See 'compliance' topic above. There are no defined scenarios, but the instructor should focus on learning opportunities when system management non-compliances manifest themselves during other scenarios. Underpinning knowledge of systems and their interactions should be developed and challenged, and not merely the application of normal procedures.	Intentionally blank								X
			CRZ APP LDG			Minimum fuel, caused by extended delays, weather, etc. where the crew would need to manage a minimum fuel situation.					X	X	X	X	
	Approach, visibility close to minimum	B	APP	Any situation where visibility becomes a threat	Recognise actual conditions. Observe aircraft and/or procedural limitations. Apply the appropriate procedures if applicable.	Approach in poor visibility	X		X	X				X	
			APP			Approach in poor visibility with deteriorations necessitating a decision to perform a go-around	X		X	X					
			LDG			Landing in poor visibility				X		X	X		

Assessment and training topic		Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	WLC
					Maintain directional control and safe flight path.										
	Landing	B	LDG	Pilots should have opportunities to practise landings in demanding situations at the defined frequency. Data indicates that landing problems have their roots in a variety of factors, including inappropriate decision-making, in addition to manual aircraft control skills if difficult environmental conditions exist. The purpose of this item is to ensure that pilots are exposed to this during the programme.	Landing in demanding environmental conditions, with malfunctions as appropriate	This topic should be combined with the adverse-weather topic, aircraft system malfunctions topic or any topic that can provide exposure to a landing in demanding conditions.	Intentionally blank								

Assessment and training topic		Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
EVAL or SBT	Surprise	B	ALL	The data analysed during the development of the EBT concept indicated substantial difficulties encountered by crews when faced with a threat or error, which was a surprise or an unexpected event. The element of surprise should be distinguished from what is sometimes referred to as the ‘startle factor’ — the latter being a physiological reaction. Wherever possible, consideration should be given towards variations in the types of scenario, times of occurrences and types of occurrence, so that pilots do not become overly familiar with repetitions of the same scenarios. Variations should be the focus of EBT	Exposure to an unexpected event or sequence of events at the defined frequency in order to build resilience.	Rejected take-off	X			X		X			
						Intentionally blank	Intentionally blank								

Assessment and training topic		Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	WLC		
				programme design, and not left to the discretion of individual instructors, in order to preserve programme integrity and fairness.													
EVAL or SBT	Wind shear recovery	B	TO	With or without warnings including predictive. A wind shear scenario is ideally combined with an adverse-weather scenario containing other elements.	Anticipate potential for wind shear. Avoid known wind shear or prepare for suspected wind shear. Recognise wind shear encounter. Take appropriate action. Apply the appropriate procedure correctly. Assure aircraft control. Recognise out of wind shear condition. Maintain or restore a safe flight path. Assess consequential issues and manage outcomes.	Predictive wind shear warning during take-off					x	x					
			TO			Wind shear encounter during take-off	x				x	x					
			TO			Wind shear encounter after rotation						x		x			
			TO			Predictive wind shear after rotation					x	x					
			APP			Predictive wind shear during approach	x				x	x					
			APP			Wind shear encounter during go-around	x				x	x		x			
			APP			Wind shear encounter during approach	x				x	x					
EVAL or SBT	Workload, distraction, pressur	B	ALL	This is not considered a topic for specific attention on its own, but more as a reminder to programme	Manage available resources efficiently to prioritise and perform tasks in a timely manner under all circumstances	Intentionally blank	Intentionally blank

AMC4 ORO.FC.232 EBT programme assessment and training topics

ED Decision 2022/014/R

GENERATION 3 (TURBOPROP) — TABLE OF ASSESSMENT AND TRAINING TOPICS

Assessment and training topic	Frequency	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Flight phase activation	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
Generation 3 Turboprop — Recurrent assessment and training matrix						Competency map								
Section 1 — Skill retention. Manoeuvres training phase (MT)														
MT	Rejected take-off	A	Rejected take-off after the application of take-off thrust and before reaching V1 (may be in LVOs or CAT I or above)	TO	From initiation of take-off to complete stop (or as applicable to the procedure)	x			x					
	Failure of the critical engine between V1 and V2	A	Failure of the critical engine from V1 and before reaching V2 in the lowest CAT I visibility or in LVO meteorological (MET) conditions.		The manoeuvre is complete at a point when the aircraft is stabilised at normal engine-out climb speed with the correct pitch and lateral control, in trim condition and, as applicable, autopilot engagement. Only one failure of the critical engine between V1 and V2 a year may be done in LVO conditions.	x			x					
	Failure of one engine on take-off	B	Failure of one engine from V1 and before reaching V2 in the lowest CAT I visibility or in LVO MET conditions.		The manoeuvre is complete at a point when the aircraft is stabilised in a clean configuration with engine-out procedures completed. Only one failure of the critical engine between V1 and V2 a year may be done in LVO conditions.	x			x					

Assessment and training topic	Frequency	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Flight phase activation	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTV	PSD	SAW	WLM	KNO
Generation 3 Turboprop — Recurrent assessment and training matrix						Competency map								
		Failure of one engine above V2 (any segment of the TO) in the lowest CAT I visibility or in LVO MET conditions.			The manoeuvre is complete at a point when the aircraft is stabilised in a clean configuration with engine-out procedures completed.	x		x	x					
Emergency descent	C	Initiation of emergency descent from normal cruise altitude		CRZ	The manoeuvre is complete once the aircraft is stabilised in emergency descent configuration (and profile). However, if the EBT programme does not include the example scenario element 'emergency descent' in the training topic 'automation management', the emergency descent procedures should be completed and should not stop once the aircraft is stabilised in emergency descent configuration.	x		x	x					
Engine-out approach & landing	A	With the critical engine (if applicable) failed, normal landing		LDG	Initiation in a stabilised engine-out configuration from not less than 3 NM final approach, until completion of roll-out	x			x					

Assessment and training topic	Frequency	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Flight phase activation	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
Generation 3 Turboprop — Recurrent assessment and training matrix						Competency map								
Engine-out approach & go-around	A	With the critical engine (if applicable) failed, manually flown normal precision approach to DA, followed by a manual go-around — the whole manoeuvre to be flown without visual reference		APP	This manoeuvre should be flown from intercept to centreline until acceleration after go-around. The manoeuvre is complete at a point when the aircraft is stabilised at normal engine-out climb speed with the correct pitch and lateral control, in trim condition and, as applicable, autopilot engagement (describe generally the critical part of the manoeuvre).	x			x					
Go-around	A	Go-around, all engines operative		APP	High energy, initiation during the approach at 150 to 300 m (500 to 1 000 ft) below the missed approach level-off altitude	x		x	x					
					Initiation of a go-around from DA followed by visual circuit and landing	x		x	x					
					During flare/rejected landing	x		x	x					
Pilot qualification to operate in either pilot’s seat	B	As per ORO.FC.235		APP	Complete the manoeuvres mandated in ORO.FC.235.	Intentionally left in blank.								

Section 2 — Equivalency of approaches relevant to operations. Evaluation phase, manoeuvres training phase or scenario-based training phase (EVAL, MT or SBT)															
MT	Approach type A or B	B	Approach type A or B flight method 3D	See equivalency of approaches relevant to operations that place an additional demand on a proficient crew	APP	See equivalency of approaches relevant to operations	x		x	x			x		x
	Approach type A	B	Approach type A flight method 2D	See equivalency of approaches relevant to operations that place an additional demand on a proficient crew	APP	See equivalency of approaches relevant to operations	x		x	x			x		x
EVAL or SBT	Approach type A	B	Approach type A flight method 3D or 2D	See equivalency of approaches relevant to operations that place an additional demand on a proficient crew	APP	See equivalency of approaches relevant to operations	x		x	x			x		x
	Approach type B	B	Approach type B flight method 3D	See equivalency of approaches relevant to operations that place an additional demand on a proficient crew	APP	See equivalency of approaches relevant to operations	x		x	x			x		x
Section 3 — Equivalency of approaches under specific approvals and Take-off under specific approvals. Evaluation phase, manoeuvres training phase or scenario-based training phase (EVAL, MT or SBT)															
MT	SPA approach(es)	B	Approach requiring specific approval	See equivalency of approaches relevant to operations — specific approval	APP	Approaches flown from FAF to landing or go-around	x		x	x					
EVAL or SBT	SPA approach(es)	B	Approach requiring specific approval	See equivalency of approaches relevant to operations — specific approval	APP	Approaches flown from FAF to landing or go-around	x		x	x					

EVAL, MT or SBT	SPA rejected take-off (RTO)	B	<p>Engine failure after the application of take-off thrust and before reaching V1 (in low-visibility MET conditions, preferably in the lowest approved visibility)</p> <p>Low-visibility RTO is not required under Part SPA but instead in Appendix 9 Section 6.</p> <p>Note: AMC1 SPA.LVO.120 point (f) does not require a low-visibility RTO. RTO is required only in the initial LVO course (point (g)(1)(iii) of AMC1 SPA.LVO.120).</p>	<p>Demonstrate manual aircraft control skills with smoothness and accuracy as appropriate to the situation.</p> <p>Detect deviations through instrument scanning.</p> <p>Maintain spare mental capacity during manual aircraft control.</p>	TO	RTO — can be combined with the assessment and training topic ‘surprise’ in EVAL or SBT	x			x							
	LVTO	B	<p>Notwithstanding AMC1 SPA.LVO120 point (f)(1)</p> <p>AMC1 SPA.LVO.120 requires SPA manoeuvres in the frequency of the OPC, as OPC is substituted in the EBT programme. Thus, the frequency in EBT is determined in every cycle (B).</p> <p>Low-visibility take-off, preferably in the lowest approved visibility</p>	<p>Maintain the aircraft within the flight envelope.</p> <p>Apply knowledge of the relationship between aircraft attitude, speed and thrust.</p>	TO	The manoeuvre is complete at a point when the aircraft is stabilised at normal climb speed with the correct pitch and lateral control, in trim condition and, as applicable, autopilot engagement.	x			x							

Assessment and training topic	Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO	
Generation 3 Turboprop — Recurrent assessment and training matrix						Competency map									
Section 4 — Training topics with frequency (A) in alphabetical order. Evaluation phase or scenario-based training phase (EVAL or SBT)															
EVAL or SBT	Adverse weather	A	GND	Thunderstorm, heavy rain, turbulence, ice build-up to include de-icing issues, as well as high-temperature conditions. The proper use of anti-ice and de-icing systems should be included generally in appropriate scenarios.	Anticipate adverse weather. Prepare for suspected adverse weather. Recognise adverse weather. Take appropriate action. Apply the appropriate procedure correctly. Assure aircraft control.	Predictive wind shear warning before take-off, as applicable	x	x			x				
			ALL			Adverse-weather scenario, e.g. thunderstorm activity, precipitation, icing		x		x		x			
			TO			Wind shear encounter during take-off, not predictive	x			x		x		x	
			TO			Predictive wind shear warning during take-off	x	x			x	x			
			TO			Crosswinds with or without strong gusts on take-off	x			x					
			CRZ			Turbulence that increases to severe turbulence		x		x		x	x		
			CRZ			Wind shear encounter scenario during cruise	x		x		x	x	x		
			APP			Reactive wind shear warning during approach or go-around	x		x	x		x			
			APP			Predictive wind shear warning during approach or go-around	x	x			x	x			
			APP			Thunderstorm encounter during approach or on missed approach	x				x	x			
			APP			Increasing tailwind on final approach (not reported)	x	x				x	x		
			APP			Approach and landing in demanding weather conditions, e.g. turbulence, up and downdrafts, gusts and crosswinds including shifting wind directions					x		x	x	

Assessment and training topic	Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTV	PSD	SAW	WLM	KNO
Generation 3 Turboprop — Recurrent assessment and training matrix						Competency map								
		APP			Non-precision approach in cold-temperature conditions, requiring altitude compensation for temperature, as applicable to the type	x	x					x		
					Crosswinds with or without strong gusts on approach, final approach and landing (within and beyond limits)	x			x		x			
					In approach, unexpected braking action 'good to medium' reported by the preceding aircraft		x				x	x	x	
					Moderate to severe icing conditions during approach effecting aircraft performance	x	x				x	x		
					Reduced visibility even after acquiring the necessary visual reference during approach, due to rain or fog	x	x				x			
EVAL or SBT	Automation management	A	CLB CRZ DES APP	The purpose of this topic is to encourage and develop effective flight path management through proficient and appropriate use of the flight management system(s), guidance and	Know how and when to use the flight management system(s), guidance and automation. Demonstrate correct methods for engagement and disengagement of the auto flight system(s). Demonstrate appropriate use of flight	ACAS warning (resolution advisory), recovery and subsequent engagement of automation	x		x					
			ALL			FMS tactical programming issues, e.g. step climb, runway changes, late clearances, destination re-programming, executing diversion	x		x					x
			CLB CRZ DES APP			Recoveries from TAWS, management of energy state to restore automated flight	x		x	x				

Assessment and training topic	Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
Generation 3 Turboprop — Recurrent assessment and training matrix						Competency map								
		CLB CRZ DES APP TO TO APP CRZ CLB CRZ CRZ DES APP APP APP	automation, including transitions between modes, monitoring, mode awareness, vigilance and flexibility needed to change from one mode to another. The means of mitigating errors are included in this topic. The errors are described as mishandled auto flight systems, inappropriate mode selection, mishandled flight management system(s) and inappropriate autopilot usage.	guidance, auto thrust and other automation systems. Maintain mode awareness of the auto flight system(s), including engagement and automatic transitions. Revert to different modes when appropriate. Detect deviations from the desired aircraft state (flight path, speed, attitude, thrust, etc.) and take appropriate action. Anticipate mishandled auto flight system. Recognise mishandled auto flight system. Take appropriate action if necessary. Restore correct auto flight state. Identify and manage consequences.	Amendments to ATC cleared levels during altitude capture modes to force mode awareness and intervention	x		x				x		
					ACAS warning (resolution advisory to level off) during climb or descent; for example, close to the cleared level when the capture mode has already been activated.	x		x				x		
					Late ATC clearance to an altitude below acceleration altitude	x		x				x		
					Engine-out special terrain procedures	x		x				x		
					Forcing autopilot disconnect followed by re-engagement, recovery from low- or high-speed events in cruise	x		x	x			x		
					Engine failure during or after initial climb using automation	x		x						
					Engine failure in cruise to onset of descent using automation	x		x						
					Emergency descent	x		x						x
					Managing high-energy descent capturing descent path from above (correlation with unstable approach training)	x		x				x		x
					No ATC clearance received prior to commencement of approach or final descent	x		x				x		
					Reactive wind shear and recovery from the consequent high-energy state	x		x				x		

Assessment and training topic	Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
Generation 3 Turboprop — Recurrent assessment and training matrix						Competency map								
			APP		Automation fail to capture the approach altitude in descent (e.g. last altitude before the FAP). Ideally, the failure occurs when the workload is high (e.g. configuration of the aircraft for final approach).					x	x	x	x	
			APP		Non-precision or infrequently flown approaches using the maximum available level of automation	x		x						x
			APP		Gear malfunction during an approach planned with autoland (including autobrake). Competency FPA may or may not be included depending on the impact of such malfunction on the automation.		x				x		x	
			APP		ATC clearances to waypoints beyond the programmed descent point for a coded final descent point during an approach utilising a final descent that is commanded by the flight management system	x		x				x		x
			APP		GPS failure prior to commencement of approach associated with position drift and a terrain alert					x	x	x		x
EVAL or SBT	Competencies — non-technical (CRM)	A	DES	This encapsulates the general CRM principles and objectives. It includes communication; leadership and	Exposure to an event or sequence of events to allow the pilot to build awareness of human factors in aviation and the human limitations.	Cabin crew report of water noise below the forward galley indicating a possible toilet pipe leak, with consequent avionics failures				x	x	x		
			APP											

Assessment and training topic	Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
Generation 3 Turboprop — Recurrent assessment and training matrix						Competency map								
		CRZ	teamwork; problem-solving and decision-making; situation awareness and management of information; and workload management. Emphasis should be placed on the development of leadership, shown by EBT data sources to be a highly effective competency in mitigating risk and improving safety through pilot performance.	This includes the development of the following competencies: <u>Communication:</u> Demonstrate: — effective use of language; — responsiveness to feedback; and — capability to state the plans and resolve ambiguities. <u>Leadership and teamwork:</u> Use appropriate authority to ensure focus on the task. Support others in completing tasks. <u>Problem-solving and decision-making:</u> Detect deviations from the desired state, evaluate problems, identify the risk, consider alternatives and select the best course of action. Continuously	Smoke removal but combined with a diversion until landing is completed.		x			x	x	x	x	x
		GND			Apron fuel spillage					x	x		x	
		CRZ			Important water leak in an aircraft galley		x			x	x		x	
		ALL			A relevant number of cabin crew are wounded or incapacitated. Additionally, the cabin crew wounded or incapacitated are the most competent (e.g. senior cabin crew member).					x	x		x	
		ALL			Unruly passenger(s)					x			x	
		GND			Passenger oxygen: passenger service unit open and mask falling down					x	x		x	
		ALL			Passenger with medical problems — medical emergency					x			x	
		CRZ			Credible threat reported to the crew. Stowaway or fugitive on board.		x			x		x	x	
		GND			No METAR or TAFOR is available for destination due to industrial action at the destination airport	x	x			x	x			
		CRZ			Credible bomb threat reported to crew		x			x		x	x	
		CLB DES			Credible bomb threat or pressurisation problem, but no quick landing possible (due to weather, terrain or other reasons)		x			x	x		x	
		APP			Diversion with low remaining fuel or increased fuel flow due to system malfunction	x				x		x	x	

Assessment and training topic		Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
Generation 3 Turboprop — Recurrent assessment and training matrix							Competency map								
EVAL or SBT			APP		review progress and adjust plans. <u>Situation awareness and management of information:</u> Have an awareness of the aircraft state in its environment; project and anticipate changes. <u>Workload management:</u> Prioritise, delegate and receive assistance to maximise focus on the task. Continuously monitor the flight progress.	ACAS warning (resolution advisory) immediately following a go-around, with a descent manoeuvre required. (The RA should be a command for descent when the aircraft is above 1 100 ft AGL.)		x			x	x	x	x	
EVAL or SBT	Compliance	A	ALL	Compliance failure. Consequences of not complying with operating instructions (e.g. SOPs). This is not intended to list example scenario elements, but instructors should ensure that	Recognise that a compliance failure has occurred. Make a verbal announcement. Take appropriate action if necessary. Restore safe flight path if necessary. Manage consequences.	The following are examples of potential compliance failures and are not intended to be developed as scenarios as part of an EBT module: 1. Requesting flap beyond limit speed 2. Flaps or slats in the wrong position for phase of flight or approach	Intentionally blank								

Assessment and training topic	Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
Generation 3 Turboprop — Recurrent assessment and training matrix						Competency map								
			observed non-compliances are taken as learning opportunities throughout the programme. In all modules of the programme, the FSTD should as far as possible be treated like an aircraft, and non-compliances should not be accepted simply for expediency.		3. Omitting an action as part of a procedure 4. Failing to initiate or complete a checklist 5. Using the wrong checklist for the situation									
EVAL or SBT	Go-around management	A	APP	Any threat or error that can result in circumstances that require a decision to perform a go-around, in addition to the execution of the go-around. Go-around scenarios should be fully	Adverse-weather scenario leading to a reactive wind shear warning during approach	x	x					x	x	
			APP		Adverse-weather scenario leading to a predictive wind shear warning during approach or go-around	x	x					x	x	
			APP		Adverse-weather scenario, e.g. thunderstorm activity, heavy precipitation or icing forcing decision at or close to DA/MDA	x					x	x	x	

Assessment and training topic	Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
Generation 3 Turboprop — Recurrent assessment and training matrix						Competency map								
			APP	developed to encourage effective leadership and teamwork, in addition to problem-solving and decision-making, plus execution using manual aircraft control or the flight management system(s) and automation as applicable. Design should include the element of surprise, and scenario-based go-arounds should not be predictable and anticipated. This topic is completely distinct from the go-around manoeuvre listed in the MT section that is	DA with visual reference in heavy precipitation with doubt about the runway surface braking capability	x					x	x	x	
			APP		Adverse-wind scenario resulting in increasing tailwind below DA (not reported)		x		x		x			
			APP		Adverse-wind scenario including strong gusts and/or crosswind out of limits below DA (not reported)		x		x		x			
			APP		Adverse-wind scenario including strong gusts and/or crosswind out of limits below 15 m (50 ft) (not reported)		x		x		x			
			APP		Lost or difficult communications resulting in no approach clearance prior to commencement of approach or final descent	x		x				x		
			APP		Birds: large flocks of birds below DA once visual reference has been established				x		x	x		
			APP		System malfunction, landing gear malfunction during the approach									

Assessment and training topic	Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
Generation 3 Turboprop — Recurrent assessment and training matrix						Competency map								
			intended only to practise psychomotor skills and a simple application of the procedures.											
EVAL or SBT	Manual aircraft control	A	CLB CRZ DES APP CLB CRZ DES APP CLB CRZ DES APP DES	Controls the flight path through manual control	Demonstrate manual aircraft control skills with smoothness and accuracy as appropriate to the situation. Detect deviations through instrument scanning. Maintain spare mental capacity during manual aircraft control. Maintain the aircraft within the normal flight envelope. Apply knowledge of the relationship between aircraft attitude, speed and thrust.	Flight with unreliable airspeed, which may or may not be recoverable	x			x		x		x
						Alternate flight control modes according to malfunction characteristics	x			x			x	x
						ACAS warning (resolution advisory) requires the pilot to descend or ATC calls for immediate descent (preferably during climb which requires a significant change in aircraft attitude)	x	x		x				
						ACAS warning (resolution advisory) requires the pilot to climb or ATC calls for immediate climb (preferably during descent which requires a significant change in aircraft attitude).	x	x		x				
						TAWS warning when deviating from planned descent routing, requiring immediate response	x			x	x			

Assessment and training topic	Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
Generation 3 Turboprop — Recurrent assessment and training matrix						Competency map								
		TO			Scenario immediately after take-off which requires an immediate and overweight landing			x	x	x	x			
		TO			Adverse wind, crosswinds with or without strong gusts on take-off	x			x					
		TO			Adverse weather, wind shear, wind shear encounter during take-off, with or without reactive warnings	x			x			x		
		TO			Engine failure during initial climb, typically 30-60 m (100-200 ft) (autopilot off)	x	x		x				x	
		CRZ			Wind shear encounter scenario during cruise, significant and rapid change in wind speed or down/updrafts, without wind shear warning	x		x			x	x	x	
		APP			Adverse weather, wind shear, wind shear encounter with or without warning during approach	x		x	x			x		
		APP			Adverse weather, deterioration in visibility or cloud base, or adverse wind, requiring a go-around from visual circling approach, during the visual segment	x	x	x	x		x	x	x	
		APP			Interception of the glide slope from above (correlation with unstable approach training)			x				x	x	
		APP LDG			Adverse wind, crosswinds with or without strong gusts on approach, final	x			x		x			

Assessment and training topic	Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
Generation 3 Turboprop — Recurrent assessment and training matrix						Competency map								
					approach and landing (within and beyond limits)									
		APP LDG			Adverse weather, adverse wind, approach and landing in demanding weather conditions, e.g. turbulence, up and downdrafts, gusts and crosswinds including shifting wind directions				x		x	x		
		APP LDG			Circling approach manually flown at night in minimum in-flight visibility to ensure ground reference, minimum environmental lighting and no glide slope guidance lights	x			x			x	x	
		APP LDG			Runway incursion during approach, which can be triggered by ATC at various altitudes or by visual contact during the landing phase	x			x			x		
		LDG			Adverse wind, visibility, type-specific, special consideration for long-bodied aircraft, landing in minimum visibility for visual reference, with crosswind	x	x		x			x		
		LDG			System malfunction, auto flight failure at DA during a low-visibility approach requiring a go-around flown manually	x		x	x			x		
		APP LDG			Approach planned with autoland, followed by a failure below 1 000 ft requiring a manual go-around and an immediate landing due to fuel shortage	x		x		x		x		
		TO			In-seat instruction:		x		x			x	x	

Assessment and training topic	Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
Generation 3 Turboprop — Recurrent assessment and training matrix						Competency map								
					Insufficient engine failure recovery, forcing the pilot monitoring to take over the flight controls									
		APP LDG			In-seat instruction: Unstable approach on short final or long landing, forcing the pilot monitoring to take over the flight controls		x		x			x	x	
EVAL or SBT	Monitoring, cross-checking, error management, mismanaged aircraft state	A	ALL	The scenarios should be realistic and relevant, and should be used for the purpose of demonstration and reinforcement of effective monitoring.	Recognise mismanaged aircraft state. Observe the pilot's behaviour: how the pilot is mitigating errors, performing cross-checking, monitoring performance and dealing with a mismanaged aircraft state, in order to ensure that observed deviations, errors and mistakes are taken as learning opportunities throughout the programme.	Deviations from the flight path, in pitch attitude, speed, altitude, bank angle		x				x		
			ALL	Modules in the FSTD should be treated like those in an aircraft so that trainees have the opportunity to develop the competency with the practice of the right techniques and attitudes	Monitor flight path excursions. Detect errors and threats through proper cross-checking performance.	In-seat instruction: Simple automation errors (e.g. incorrect mode selection, attempted engagement without the necessary conditions, entering wrong altitude or speed, failure to execute the desired mode) culminating in a need for direct intervention from the pilot monitoring, and where necessary taking control.		x				x		
			APP			In-seat instruction: Unstable approach or speed/path/vertical rate not congruent with the required state for the given flight condition	x	x				x	x	
			LDG			In-seat instruction: Demonstration exercise — recovery from bounced landing, adverse wind, strong gusts during landing phase, resulting in a bounce and necessitating	x			x		x		

Assessment and training topic	Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
Generation 3 Turboprop — Recurrent assessment and training matrix						Competency map								
			<p>related to these topics through pilot performance, and that instructors have the opportunity to assess and train these topics in a realistic environment. As shown by the EBT data report, these topics are of key importance to improve safety in operations.</p> <p>In addition, the operator may also use these topics to develop scripted role-playing scenarios in the form of ISI. These scenarios cater for the need to monitor flight path excursions from the instructor pilot</p>	<p>Make appropriate interventions either verbally or by taking control if applicable. Take appropriate action if necessary. Restore the desired aircraft state. Identify and manage consequences.</p>	recovery action from the pilot monitoring									

Assessment and training topic	Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
Generation 3 Turboprop — Recurrent assessment and training matrix						Competency map								
			(PF), detect errors and make appropriate interventions, either verbally or by taking control as applicable. Demonstration scenarios may also be used. Demonstrated role-play should contain realistic and not gross errors, leading at times to a mismanaged aircraft state, which can also be combined with upset management training.											
Unstable approach	A	DES APP	Reinforce stabilised approach philosophy and adherence to		ATC or terrain-related environment creating a high-energy descent with the need to capture the optimum profile to complete the approach in a stabilised configuration	x		x				x		

Assessment and training topic	Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO	
Generation 3 Turboprop — Recurrent assessment and training matrix						Competency map									
			DES APP	defined parameters. Encourage go-arounds when crews are outside these parameters.		ATC or terrain-related environment creating a high-energy descent leading to unstable conditions and requiring a go-around	x		x			x			
			APP	Develop and sustain competencies related to the management of high-energy situations.		Approach and landing in demanding weather conditions, e.g. turbulence, up and downdrafts, gusts and crosswinds including shifting wind directions				x	x				
			APP	Increasing tailwind on final approach (not reported)		x	x			x	x				
			APP LDG	Crosswinds with or without strong gusts on approach, final approach and landing (within and beyond limits)		x			x		x				
Section 5 — UPRT training topic with frequency (B). Evaluation phase, manoeuvres training phase or scenario-based training phase (EVAL, MT or SBT)															
EVAL, MT or SBT	Upset prevention training	B	N/A	Compliance with AMC1 or AMC2 to ORO.FC.220&230	Early recognition and prevention of upset conditions. When the differences between LHS and RHS are not significant in the handling of the aircraft, UPRT may be conducted in either seat.	See Table 1 of AMC1 ORO.FC.220&230: Elements and respective components of upset prevention training.	Intentionally blank								
			CRZ	Include upset prevention elements in Table 1 for the recurrent training programme in at least every cycle, such that all the elements are covered over a period not exceeding 3 years.		Demonstration of the defined normal flight envelope and any associated changes in flight instruments, flight director systems, and protection systems. This should take the form of an instructor-led exercise to show the crew the points beyond which an upset condition could exist.			x				x	x	
			TO APP			Severe wind shear or wake turbulence during take-off or approach			x	x		x	x		
			CRZ			As applicable and relevant to the aircraft type, demonstration at a suitable				x			x		x

Assessment and training topic	Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
Generation 3 Turboprop — Recurrent assessment and training matrix						Competency map								
			The elements are numbered with letters from A to I in Table 1 of AMC1 ORO.FC.220&230. Each element is made up of several numbered components. According to the principles of EBT, covering one component should satisfy the requirement to cover the whole element of recognising and preventing the development of upset conditions.		intermediate level, with turbulence as appropriate; practise steep turns and note the relationship between bank angle, pitch and stalling speed									
		CRZ			At the maximum cruise flight level for the current aircraft weight, turbulence to trigger overspeed conditions (if FSTD capability exists, consider use of the vertical wind component to add realism)	x		x	x			x		
		CRZ			At the maximum cruise flight level for the current aircraft weight, turbulence and significant temperature rise to trigger low-speed conditions (if FSTD capability exists, consider use of the vertical wind component to add realism)			x	x			x		x
		CRZ			High-altitude loss of reliable airspeed	x	x		x			x	x	
		CRZ			High-altitude ACAS RA (where the RA is required to be flown in manual flight)	x			x			x	x	

Section 6 — Training topics with frequency (B) in alphabetical order. Evaluation phase or scenario-based training phase (EVAL or SBT)											
EVAL or SBT	Aircraft system malfunctions, including operations under MEL	B	ALL	<p>Any internal failure(s) apparent or not apparent to the crew</p> <p>Any item cleared by the MEL but having an impact upon flight operations — for instance, thrust reverser locked.</p> <p>Malfunctions to be considered should have one or more of the following characteristics: Immediacy Complexity Degradation of aircraft control Loss of primary instrumentation Management of consequences The operator should vary malfunctions for each characteristic over the EBT cycle.</p>	<p>Recognise system malfunction. Take appropriate action including correct stop/go decision. Apply the appropriate procedure correctly. Maintain aircraft control. Manage consequences.</p> <p>Apply crew operating procedures where necessary. Respond appropriately to additional system abnormalities associated with MEL dispatch.</p>	<p>(i) System malfunctions that require immediate and urgent crew intervention or decision, e.g. fire, smoke, loss of pressurisation at high altitude, failures during take-off, brake failure during landing.</p> <p>(ii) System malfunctions that require complex procedures, e.g. multiple hydraulic system failures, smoke and fumes procedures, major electrical system failure.</p> <p>(iii) System malfunctions that result in significant degradation of flight controls in combination with abnormal handling characteristics, e.g. jammed flight controls, certain degradation of FBW control, jammed horizontal stabiliser; flaps and/or slats locked; other malfunctions that result in degraded flight controls.</p> <p>(iv) System failures that require monitoring and management of the flight path using degraded or alternative displays, unreliable primary flight path information, unreliable airspeed, e.g. flight with unreliable airspeed</p> <p>(v) System failures that require extensive management of their consequences (independent of operation or environment), e.g. fuel leak.</p>	Intentionally blank				
			TO								
						MEL items with crew operating procedures applicable during take-off					x
											x

			TO	Unless specified otherwise in the operational suitability data, at least one malfunction with each characteristic should be included in every cycle. Combining characteristics should not reduce the number of malfunctions below seven for each cycle. For each crew member, the characteristics of degraded control and loss of instrumentation should be in the role of pilot flying and the others may be in the role of pilot flying or pilot monitoring. For full details, see the malfunction equivalency methodology.		Response to an additional factor that is affected by an MEL item (e.g. system failure, runway state)		x		x		x			x
			GND			Malfunction during preflight preparation and prior to departure	x					x	x		
			CLB			Malfunction after departure	x					x	x		x
			ALL			Malfunctions that require immediate attention (e.g. bleed fault during engine start, hydraulic failure during taxi)	x				x			x	
			CLB CRZ			Fuel leak (management of consequences)	x				x		x		x
			TO			Malfunction on take-off high speed below V1	x				x	x			
			TO			Malfunction on take-off high speed above V1	x					x			
			GND			During taxi to the runway, a spurious brake temperature announcement. The crew had the correct brake temperature moments before the failure.					x	x	x		
			TO			Tyre failure during take-off					x	x		x	
			TO			Malfunction on initial climb	x					x			
			APP			Malfunction on approach	x					x		x	
			APP			Malfunction on go-around	x					x		x	
			LDG			Malfunction during landing	x	x		x		x	x		
EVAL	Aircraft system management	B		Normal system operation	This is not considered as a stand-alone topic. It is	See 'compliance' topic above. There are no defined scenarios, but the instructor	Intentionally blank								x

				according to defined instructions	linked with the topic 'compliance'. Where a system is not managed according to normal or defined procedures, this is determined as a non-compliance.	should focus on learning opportunities when system management non-compliances manifest themselves during other scenarios. Underpinning knowledge of systems and their interactions should be developed and challenged, and not merely the application of normal procedures.										
			CRZ APP LDG													
	Approach, visibility close to minimum	B	APP	Any situation where visibility becomes a threat	Recognise actual conditions. Observe aircraft and/or procedural limitations. Apply the appropriate procedures if applicable. Maintain directional control and safe flight path.	Approach in poor visibility	x		x	x					x	
			APP			Approach in poor visibility with deteriorations necessitating a decision to perform a go-around	x			x	x					
			LDG			Landing in poor visibility					x		x	x		
	Landing	B	LDG	Pilots should have opportunities to practise landings in demanding situations at the defined frequency. Data indicates that landing problems have their roots in a variety of factors, including inappropriate decision-making, in addition to	Landing in demanding environmental conditions, with malfunctions as appropriate	This topic should be combined with the adverse-weather topic, aircraft system malfunctions topic or any topic that can provide exposure to a landing in demanding conditions.	Intentionally blank									

				manual aircraft control skills if difficult environmental conditions exist. The purpose of this item is to ensure that pilots are exposed to this during the programme.			
EVAL or SBT	Surprise	B	ALL	The data analysed during the development of the EBT concept indicated substantial difficulties encountered by crews when faced with a threat or error, which was a surprise or an unexpected event. The element of surprise should be distinguished from what is sometimes referred to as the 'startle factor' — the latter being a physiological reaction. Wherever possible,	Exposure to an unexpected event or sequence of events at the defined frequency in order to build resilience.	Rejected take-off	<div> <div>x</div> <div></div> <div></div> <div></div> <div>x</div> <div></div> <div>x</div> <div></div> <div></div> </div>
						Intentionally blank	Intentionally blank

Page 668 of 2314 | Dec 2022

	Workload, distraction, pressure, stress	B	ALL	This is not considered a topic for specific attention on its own, but more as a reminder to programme developers to ensure that pilots are exposed to immersive training scenarios which expose them to manageable high workload and distractions during the course of the EBT programme, at the defined frequency.	Manage available resources efficiently to prioritise and perform tasks in a timely manner under all circumstances.	Intentionally blank	Intentionally blank
Section 7 — UPRT Upset recovery training topic with frequency (C). Manoeuvres training phase or scenario-based training phase (MT or SBT)							
MT or SBT	Upset recovery	C	N/A	Compliance with AMC1 or AMC2 to ORO.FC.220&230	Recognise upset condition.	The example scenario elements may be done in ISI, as non-ISI or a combination of both. If done in ISI: The instructor should position the aircraft within but close to the edge of the validated training envelope before handing control to the trainee to demonstrate the restoration of normal flight. Careful consideration should be given to flying within the validated training envelope.	Intentionally blank
				Include the recovery exercises in Table 2 of AMC1 ORO.FC.220&230 for the recurrent training programme, such that all the exercises are covered over a	Make timely and appropriate intervention. Take appropriate action. Assure timely and appropriate intervention. (AMC1 ORO.FC.220&230 Table 2 component 1)	Table 2 of AMC1 ORO.FC.220&230: Exercises for upset recovery training	
					Assure aircraft control.	A. Recovery from developed upsets	

				period not exceeding 3 years. According to the principles of EBT, covering one component should satisfy the requirement to cover the whole element of recovery from developed upsets.	Maintain or restore a safe flight path. Assess consequential issues. Manage outcomes. Consolidate the summary of aeroplane recovery techniques. (AMC1 ORO.FC.220&230 Table 2 component 5)	2.	Recovery from stall events in the following configurations: take-off configuration, clean configuration low altitude, clean configuration near maximum operating altitude, and landing configuration during the approach phase.	x			x				x	x	
			CRZ	The same principles apply to the exercises of components 2, 3 and 4 where one exercise may satisfy the requirement to cover the whole component.	Note: The operator should assess if the exercises should be practised for the either seat qualification.	3.	Recovery from nose high at various bank angles	x			x				x	x	
			CRZ			4.	Recovery from nose low at various bank angles	x			x				x	x	
			APP			Demonstration at a normal cruising altitude. Set conditions and disable aircraft systems as necessary to enable trainee to perform stall recovery according to OEM instructions.	x			x				x			
			CLB DES			Demonstration at an intermediate altitude during early stages of the approach. Set conditions and disable aircraft systems as necessary to enable trainee to perform stall recovery according to OEM instructions.	x			x				x			

				An aeroplane upset is defined as an undesired aeroplane state in flight characterised by unintentional divergences from parameters normally experienced during line operations or training. An aeroplane upset may involve pitch and/or bank angle divergences as well as inappropriate airspeeds for the conditions.		Recovery from a wake turbulence position with high-bank angle	x		x	x				x			
Section 8 — Training topics with frequency (C) in alphabetical order. Evaluation phase or scenario-based training phase (EVAL or SBT)																	
EVAL or SBT	Adverse wind	C	TO	Adverse wind/crosswind. This includes tailwind but not ATC mis-reporting of the actual wind.	Recognise adverse-wind conditions. Observe limitations. Apply the appropriate procedures. Maintain directional control and safe flight path.	Take-off with different crosswind/tailwind/gust conditions								x		x	
			TO			Take-off with unreported tailwind		x			x						
			TO			Crosswinds with or without strong gusts on take-off	x			x							
			APP			Wind exceeding limits on final approach (not reported)	x	x					x	x			
			APP			Wind exceeding limits on final approach (reported) in manual aircraft control	x	x		x			x				
			APP			Increasing tailwind on final approach (not reported)	x	x					x	x			

EVAL or SBT	ATC	C	APP		Respond to communications appropriately. Recognise, clarify and resolve any ambiguities. Refuse or question unsafe instructions. Use standard phraseology whenever possible.	Approach and landing in demanding weather conditions, e.g. turbulence, up and downdrafts, gusts and crosswind including shifting wind directions				x		x	x		
			APP			Adverse-wind scenario resulting in increasing tailwind below DA (not reported)		x		x		x			
			APP			Adverse-wind scenario including strong gusts and/or crosswind out of limits below DA (not reported)		x		x		x			
			APP			Adverse-wind scenario including strong gusts and/or crosswind out of limits below 15 m (50 ft) (not reported)		x		x		x			
			APP LDG			Crosswind with or without strong gusts on approach, final approach and landing (within and beyond limits)	x			x		x			
			ALL	ATC error. Omission, miscommunication , garbled, poor quality transmission. All these act as distractions to be managed by the crew. The scenarios should be combined, where possible, with others of the same or higher weighting, the principal reason being to create distractions.	ATC role-play: the instructor provides scripted instructions, as a distraction to the crew	x	x			x					
			ALL		Controller error, provided by the instructor according to a defined scripted scenario	x	x				x	x			
			ALL		Frequency congestion, with multiple aircraft using the same frequency		x								
			APP		Destination temporarily closed					x	x	x	x		
			CRZ		Rescue and firefighting services (RFFS) level reduction at destination		x			x		x			
APP	Runway change before the interception of the localiser or similar navigation aid in azimuth				x		x		x	x					
GND TO	Stray dogs at the opposite threshold runway		x				x		x						
ALL	Poor quality transmissions		x												

EVAL or SBT	Engine failure	C	TO	Any engine failure or malfunction, which causes loss or degradation of thrust that affects performance. This is distinct from the engine-out manoeuvres described in the MT section above, which are intended only to practise psychomotor skills and reinforce procedures to manage engine failures.	Recognise engine failure. Take appropriate action. Apply the appropriate procedure correctly. Maintain aircraft control. Manage consequences.	Engine failure or engine malfunction on take-off low speed	x			x		x		x	
			TO			Engine failure or engine malfunction on take-off high speed below V1	x			x		x		x	
			TO			Engine failure or engine malfunction on take-off above V1	x					x	x	x	
			TO			Engine failure or engine malfunction on initial climb	x					x	x		
			APP			Engine malfunction	x					x		x	
			CRZ			Engine failure in cruise (with autopilot)	x			x			x		
			LDG			Engine failure or engine malfunction on landing					x				
EVAL or SBT	Fire and smoke management	C	GND	This includes engine, electric, pneumatic, cargo fire, smoke or fumes.	Recognise fire, smoke or fumes. Take appropriate action. Apply the appropriate procedure correctly. Maintain aircraft control. Manage consequences.	Fire in cargo or cabin/cockpit at gate	x	x				x		x	
			GND			Fire during taxi	x	x				x		x	x
			GND			Fire with no cockpit indication	x	x				x		x	x
			TO			Take-off low speed	x			x	x	x			x
			TO			Fire or smoke on take-off high speed below V1	x			x	x	x			
			TO			Fire or smoke on take-off high speed above V1	x				x	x			
			TO			Fire or smoke on initial climb	x				x	x			
			CRZ			Cargo fire						x	x	x	
			APP			Engine fire in approach (extinguishable)		x				x			

			APP			Engine fire in approach (non-extinguishable)		x			x	x			
			CLB CRZ DES			Lithium battery fire in the cockpit or cabin compartment	x	x			x	x		x	
			APP			Flight deck or cabin fire		x			x	x			x
			GND			Any of the example scenario elements above ending in an evacuation		x			x	x		x	
EVAL or SBT	Loss of communications	C	GND	Lost or difficult communications due to either pilot mis-selection or a failure external to the aircraft. This could be for a few seconds or a total loss.	Recognise loss of communications. Take appropriate action. Execute the appropriate procedure as applicable. Use alternative ways to communicate. Manage consequences.	Loss of communications during ground manoeuvring	x	x							
			TO			Loss of communications after take-off	x					x			x
			APP			Loss of communications during approach phase, including go-around	x	x				x	x		x
EVAL or SBT	Managing loading, fuel, performance errors	C	ALL	A calculation error by one or more pilots, or someone involved with the process, or the process itself, e.g. incorrect information on the load sheet	Anticipate the potential for errors in load/fuel/performance data. Recognise inconsistencies. Manage/avoid distractions. Make changes to paperwork/aircraft system(s) to eliminate error. Identify and manage consequences.	This can be a demonstrated error, in that the crew may be instructed to deliberately insert incorrect data — for example, to take off from an intersection with full-length performance information. The crew will be asked to intervene when acceleration is sensed to be lower than normal, and this may be part of the operator procedures, especially when operating mixed fleets with considerable variations in MTOM.	x	x						x	
			GND			Fuel ground staff on industrial action. Only limited amount of fuel available, which is below the calculated fuel for the flight.					x	x	x	x

						the launch, like the Guiana Space Centre, Cape Cañaveral, etc.).										
	Operations- or type-specific	C	ALL	Intentionally blank	Intentionally blank	Intentionally blank	Intentionally blank									
	Operations of special airport approval	C	APP LDG	See equivalency of approaches relevant to operations.	The operator should comply with the national qualification requirements published in the Aeronautical Information Publication.	Intentionally blank	Intentionally blank									
EVAL or SBT	Pilot incapacitation	C	TO	Consequences for the non-incapacitated pilot	Recognise incapacitation. Take appropriate action including correct stop/go decision. Apply the appropriate procedure correctly. Maintain aircraft control. Manage consequences.	During take-off	x	x			x	x				x
			APP			During approach	x			x				x	x	
	Runway or taxiway condition	C	GND TO LDG	Contamination or surface quality of the runway, taxiway, or tarmac including foreign objects	Recognise hazardous runway condition. Observe limitations. Take appropriate action. Apply the appropriate procedures correctly. Assure aircraft control.	Planned anticipated hazardous conditions with dispatch information provided to facilitate planning and execution of appropriate procedures						x			x	
			GND TO LDG			Unanticipated hazardous conditions, e.g. unexpected heavy rain resulting in flooded runway surface		x			x	x				
			TO			Take-off on runway with reduced cleared width due to snow	x			x	x		x			
			TO			Stop/go decision in hazardous conditions					x	x		x		

EVAL or SBT	Traffic	C	CLB CRZ DES	Traffic conflict. ACAS RA or TA, or visual observation of conflict, which requires evasive manoeuvring	Anticipate potential loss of separation. Recognise loss of separation. Take appropriate action. Apply the appropriate procedure correctly. Maintain aircraft control. Manage consequences.	ACAS warning that requires crew intervention		x					x	x	x	
						Dilemma: Visual acquisition of conflicting traffic followed by an ACAS warning (resolution advisory) triggered by the same or other traffic. Even if the traffic is in sight, the pilot should follow the RA.	x			x	x					
						While in descent, ACAS warning (traffic advisory) of an aircraft below. The crew should not initiate an avoidance manoeuvre based on TA (except decreasing the rate of descent unless otherwise instructed by ATC, etc.). This example scenario can be done during climb with conflicting traffic above.	x					x				

END GEN3 TURBOPROP

AMC5 ORO.FC.232 EBT programme assessment and training topics

ED Decision 2021/002/R

GENERATION 2 (JET) — EBT PROGRAMME — TABLE OF ASSESSMENT AND TRAINING TOPICS

Given the very small number of turbo-jet aeroplanes of the second generation in current use in commercial air transport operations, the operator should apply for an alternative means of compliance to develop a table of assessment and training topics to apply EBT.

AMC6 ORO.FC.232 EBT programme assessment and training topics

ED Decision 2022/014/R

GENERATION 2 (TURBOPROP) — TABLE OF ASSESSMENT AND TRAINING TOPICS

Assessment and training topic	Frequency	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Flight phase activation	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
Generation 2 Turboprop — Recurrent assessment and training matrix						Competency map								
Section 1 — Skill retention. Manoeuvres training phase (MT)														
MT	Rejected take-off	A	Engine failure after the application of take-off thrust and before reaching V1 (may be in LVO or CAT I or above)		TO	From initiation of take-off to complete stop (or as applicable to the procedure)	x			x				
	Failure of the critical engine between V1 and V2	A	Failure of the critical engine from V1 and before reaching V2 in the lowest CAT I visibility or in LVO meteorological (MET) conditions.		TO	The manoeuvre is complete at a point when the aircraft is stabilised at normal engine-out climb speed with the correct pitch and lateral control, in trim condition and, as applicable, autopilot engagement. Only one failure of the critical engine between V1 and V2 a year may be done in LVO conditions.	x			x				
	Failure of one engine on take-off	B	Failure of one engine from V1 and before reaching V2 in the lowest CAT I visibility or in LVO MET conditions.		TO	The manoeuvre is complete at a point when the aircraft is stabilised in a clean configuration with engine-out procedures completed. Only one failure of the critical engine between V1 and V2 a year may be done in LVO conditions.	x			x				

Assessment and training topic	Frequency	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Flight phase activation	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
Generation 2 Turboprop — Recurrent assessment and training matrix						Competency map								
		Failure of one engine above V2 (any segment of the TO) in the lowest CAT I visibility or in LVO MET conditions.			The manoeuvre is complete at a point when the aircraft is stabilised in a clean configuration with engine-out procedures completed	x		x	x					
Emergency descent	C	Initiation of emergency descent from normal cruise altitude		CRZ	The manoeuvre is complete once the aircraft is stabilised in emergency descent configuration (and profile). However, if the EBT programme does not include the example scenario element ‘emergency descent’ in the training topic ‘automation management’, the emergency descent procedures should be completed and should not stop once the aircraft is stabilised in emergency descent configuration.	x		x	x					
Engine-out approach & landing	A	With the critical engine (if applicable) failed, normal landing		LDG	Initiation in a stabilised engine-out configuration from not less than 3 NM final approach, until completion of roll-out	x			x					

Assessment and training topic	Frequency	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Flight phase activation	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
Generation 2 Turboprop — Recurrent assessment and training matrix						Competency map								
Engine-out approach & go-around	A	With the critical engine (if applicable) failed, manually flown normal precision approach to DA, followed by a manual go-around — the whole manoeuvre to be flown without visual reference		APP	This manoeuvre should be flown from intercept to centreline until acceleration after go-around. The manoeuvre is complete at a point when the aircraft is stabilised at normal engine-out climb speed with the correct pitch and lateral control, in trim condition and, as applicable, autopilot engagement (describe generally the critical part of the manoeuvre).	x			x					
Go-around	A	Go-around, all engines operative		APP	High energy, initiation during the approach at 150 to 300 m (500 to 1 000 ft) below the missed approach level-off altitude	x		x	x					
					Initiation of a go-around from DA followed by visual circuit and landing	x		x	x					
					During flare/rejected landing	x		x	x					
Pilot qualification to operate in either pilot’s seat	B	As per ORO.FC.235		APP	Complete the manoeuvres mandated in ORO.FC.235.	Intentionally left in blank.								

Section 2 — Equivalency of approaches relevant to operations. Evaluation phase, manoeuvres training phase or scenario-based training phase (EVAL, MT or SBT)															
MT	Approach type A or B	B	Approach type A or B flight method 3D	See equivalency of approaches relevant to operations that place an additional demand on a proficient crew	APP	See equivalency of approaches relevant to operations	x		x	x			x		x
	Approach type A	B	Approach type A flight method 2D	See equivalency of approaches relevant to operations that place an additional demand on a proficient crew	APP	See equivalency of approaches relevant to operations	x		x	x			x		x
EVAL or SBT	Approach type A	B	Approach type A flight method 3D or 2D	See equivalency of approaches relevant to operations that place an additional demand on a proficient crew	APP	See equivalency of approaches relevant to operations	x		x	x			x		x
	Approach type B	B	Approach type B flight method 3D	See equivalency of approaches relevant to operations that place an additional demand on a proficient crew	APP	See equivalency of approaches relevant to operations	x		x	x			x		x
Section 3 – Equivalency of approaches under specific approvals and take-off under specific approvals. Evaluation phase, manoeuvres training phase or scenario-based training phase (EVAL, MT or SBT)															
MT	SPA approach(es)	B	Approach requiring specific approval	See equivalency of approaches relevant to operations — specific approval	APP	Approaches flown from FAF to landing or go-around	x		x	x					
EVAL or SBT	SPA approach(es)	B	Approach requiring specific approval	See equivalency of approaches relevant to operations — specific approval	APP	Approaches flown from FAF to landing or go-around	x		x	x					

EVAL, MT or SBT	SPA rejected Take-off (RTO)	B	<p>Engine failure after the application of take-off thrust and before reaching V1 (in low-visibility MET conditions, preferably in the lowest approved visibility)</p> <p>Low-visibility RTO is not required under Part SPA but instead in Appendix 9 Section 6.</p> <p>Note: AMC1 SPA.LVO.120 point (f) does not require a low-visibility RTO. RTO is required only in the initial LVO course (point (g)(1)(iii) of AMC1 SPA.LVO.120).</p>	<p>Demonstrate manual aircraft control skills with smoothness and accuracy as appropriate to the situation.</p> <p>Detect deviations through instrument scanning.</p> <p>Maintain spare mental capacity during manual aircraft control.</p>	TO	RTO — can be combined with the assessment and training topic ‘surprise’ in EVAL or SBT	x			x							
	LVTO	B	<p>Notwithstanding AMC1 SPA.LVO120 point (f)(1)</p> <p>AMC1 SPA.LVO.120 requires SPA manoeuvres in the frequency of the OPC, as OPC is substituted in the EBT programme. Thus, the frequency in EBT is determined in every cycle (B).</p> <p>Low-visibility take-off, preferably in the lowest approved visibility</p>	<p>Maintain the aircraft within the flight envelope.</p> <p>Apply knowledge of the relationship between aircraft attitude, speed and thrust.</p>	TO	The manoeuvre may be complete at a point when the aircraft is stabilised at normal climb speed with the correct pitch and lateral control, in trim condition and, as applicable, autopilot engagement.	x			x							

Assessment and training topic	Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO

			Each element is made up of several numbered components. According to the principles of EBT, covering one component should satisfy the requirement to cover the whole element of recognising and preventing the development of upset conditions.		to trigger overspeed conditions (if FSTD capability exists, consider use of the vertical wind component to add realism)									
		CRZ			At the maximum cruise flight level for the current aircraft weight, turbulence and significant temperature rise to trigger low-speed conditions (if FSTD capability exists, consider use of the vertical wind component to add realism)			x	x			x		x
		CRZ			High-altitude loss of reliable airspeed	x	x		x			x	x	
		CRZ			High-altitude ACAS RA (where the RA is required to be flown in manual flight)	x			x			x	x	
Section 6 — Training topics with frequency (B) in alphabetical order. Evaluation phase or scenario-based training phase (EVAL or SBT)														
EVAL, MT or SBT		B	ALL	For full details, see the malfunction equivalency methodology. Any internal failure(s) apparent or not apparent to the crew	Recognise system malfunction. Take appropriate action including correct stop/go decision. Apply the appropriate procedure correctly. Maintain aircraft control. Manage consequences.	(i) System malfunctions that require immediate and urgent crew intervention or decision, e.g. fire, smoke, loss of pressurisation at high altitude, failures during take-off, brake failure during landing. (ii) System malfunctions that require complex procedures, e.g. multiple hydraulic system failures, smoke and fumes procedures, major electrical system failure.								
						Intentionally blank								

Assessment and training topic	Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTV	PSD	SAW	WLM	KNO
Generation 3 Turboprop — Recurrent assessment and training matrix						Competency map								
			Any item cleared by the MEL but having an impact upon flight operations — for instance, thrust reverser locked.	Apply crew operating procedures where necessary. Respond appropriately to additional system abnormalities associated with MEL dispatch.	(iii) System malfunctions that result in significant degradation of flight controls in combination with abnormal handling characteristics, e.g. jammed flight controls, certain degradation of FBW control, jammed horizontal stabiliser; flaps and/or slats locked; other malfunctions that result in degraded flight controls. (iv) System failures that require monitoring and management of the flight path using degraded or alternative displays, unreliable primary flight path information, unreliable airspeed, e.g. flight with unreliable airspeed (v) System failures that require extensive management of their consequences (independent of operation or environment), e.g. fuel leak.									
		TO	Malfunctions to be considered should have one or more of the following characteristics: Immediacy Complexity Degradation of aircraft control Loss of primary instrumentation Management of consequences		MEL items with crew operating procedures applicable during take-off						x			x
		TO	The operator should vary malfunctions for each characteristic		Response to an additional factor that is affected by an MEL item (e.g. system failure, runway state)		x		x		x			x
		GND			Malfunction during preflight preparation and prior to departure	x					x	x		
		CLB			Malfunction after departure	x					x	x		x

Assessment and training topic	Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
Generation 3 Turboprop — Recurrent assessment and training matrix						Competency map								
		ALL	over the EBT cycle.		Malfunctions that require immediate attention (e.g. bleed fault during engine start, hydraulic failure during taxi)	x				x			x	
		CLB CRZ	Unless specified otherwise in the operational suitability data, at least one malfunction with each characteristic should be included in every cycle. Combining characteristics should not reduce the number of malfunctions below seven for each cycle. For each crew member, the characteristics of degraded control and loss of instrumentation should be in the role of pilot flying and the others		Fuel leak (management of consequences)	x				x		x		x
		TO			Malfunction on take-off high speed below V1	x				x	x			
		TO			Malfunction on take-off high speed above V1	x					x			
		GND			During taxi to the runway, a spurious brake temperature announcement. The crew had the correct brake temperature moments before the failure.					x	x	x		
		TO			Tyre failure during take-off					x	x		x	
		TO			Malfunction on initial climb	x					x			
		APP			Malfunction on approach	x					x		x	
		APP			Malfunction on go-around	x					x		x	
		LDG			Malfunction during landing	x	x		x		x	x		

Assessment and training topic		Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
Generation 3 Turboprop — Recurrent assessment and training matrix							Competency map								
				may be in the role of pilot flying or pilot monitoring. For full details, see the malfunction equivalency methodology.											
EVAL or SBT	Engine failure	B	TO	Any engine failure or malfunction, which causes loss or degradation of thrust that affects performance. This is distinct from the engine-out manoeuvres described in the MT section above, which are intended only to practise psychomotor skills and reinforce procedures to manage engine failures.	Recognise engine failure. Take appropriate action. Apply the appropriate procedure correctly. Maintain aircraft control. Manage consequences.	Engine failure or engine malfunction on take-off low speed	x			x		x		x	
			TO			Engine failure or engine malfunction on take-off high speed below V1	x			x		x		x	
			TO			Engine failure or engine malfunction on take-off above V1	x					x	x	x	
			TO			Engine failure or engine malfunction on initial climb	x					x	x		
			APP			Engine malfunction	x					x		x	
			CRZ			Engine failure in cruise (with autopilot)	x		x				x		
		LDG				Engine failure or engine malfunction on landing									
										x					

Assessment and training topic		Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
Generation 3 Turboprop — Recurrent assessment and training matrix							Competency map								
	Landing	B	LDG	Pilots should have opportunities to practise landings in demanding situations at the defined frequency. Data indicates that landing problems have their roots in a variety of factors, including inappropriate decision-making, in addition to manual aircraft control skills if difficult environmental conditions exist. The purpose of this item is to ensure that pilots are exposed to this during the programme.	Landing in demanding environmental conditions, with malfunctions as appropriate	This topic should be combined with the adverse-weather topic, aircraft system malfunctions topic or any topic that can provide exposure to a landing in demanding conditions.	Intentionally blank								
EVAL	Surprise	B	ALL	The data analysed during the	Exposure to an unexpected event or	Rejected take-off	x			x		x			

Assessment and training topic		Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
Generation 3 Turboprop — Recurrent assessment and training matrix							Competency map								
				development of the EBT concept indicated substantial difficulties encountered by crews when faced with a threat or error, which was a surprise or an unexpected event. The element of surprise should be distinguished from what is sometimes referred to as the ‘startle factor’ — the latter being a physiological reaction. Wherever possible, consideration should be given towards variations in the types of scenario,	sequence of events at the defined frequency in order to build resilience.	Intentionally blank	Intentionally blank								

Assessment and training topic		Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTV	PSD	SAW	WLM	KNO
Generation 3 Turboprop — Recurrent assessment and training matrix							Competency map								
				times of occurrences and types of occurrence, so that pilots do not become overly familiar with repetitions of the same scenarios. Variations should be the focus of EBT programme design, and not left to the discretion of individual instructors, in order to preserve programme integrity and fairness.											
EVAL or SBT	Terrain	B	ALL	Alert, warning, or conflict	Anticipate terrain threats.	ATC clearance giving insufficient terrain clearance	x	x			x				
			ALL		Prepare for terrain threats.	Demonstration of terrain avoidance warning systems (TAWS) (this scenario element may be done in an ISI.)						x	x	x	
			TO CLB		Recognise unsafe terrain clearance. Take appropriate action.	Engine failure where performance is marginal leading to TAWS warning		x		x				x	

Assessment and training topic	Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO
Generation 3 Turboprop — Recurrent assessment and training matrix						Competency map								
		DES APP		Apply the appropriate procedures correctly. Maintain aircraft control. Restore safe flight path. Manage consequences.	ATC provides a wrong QNH		x					x		
		DES			'Virtual mountain' refers to the surprise element of an unexpected warning. Care should be exercised in creating a level of realism, so this can best be achieved by an unusual and unexpected change of route during the descent.						x	x	x	

Assessment and training topic		Frequency	Flight phase activation	Description (includes type of topic, being threat, error or focus)	Desired outcome (includes performance criteria OR training outcome)	Guidance material (GM) Example scenario elements	PRO	COM	FPA	FPM	LTW	PSD	SAW	WLM	KNO

			APP			Flight deck or cabin fire		x			x	x				x
			GND			Any of the example scenario elements above ending in an evacuation		x			x	x		x		

EVAL or SBT	Loss of communications	C	GND	Lost or difficult communications due to either pilot mis-selection or a failure external to the aircraft. This could be for a few seconds or a total loss.	Recognise loss of communications. Take appropriate action. Execute the appropriate procedure as applicable. Use alternative ways to communicate. Manage consequences.	Loss of communications during ground manoeuvring	x	x								
			TO			Loss of communications after take-off	x					x				x
			APP			Loss of communications during approach phase, including go-around	x	x				x	x			x
EVAL or SBT	Managing loading, fuel, performance errors	C	ALL	A calculation error by one or more pilots, or someone involved with the process, or the process itself, e.g. incorrect information on the load sheet	Anticipate the potential for errors in load/fuel/performance data. Recognise inconsistencies. Manage/avoid distractions. Make changes to paperwork/aircraft system(s) to eliminate error. Identify and manage consequences.	This can be a demonstrated error, in that the crew may be instructed to deliberately insert incorrect data — for example, to take off from an intersection with full-length performance information. The crew will be asked to intervene when acceleration is sensed to be lower than normal, and this may be part of the operator procedures, especially when operating mixed fleets with considerable variations in MTOM.	x	x							x	
			GND			Fuel ground staff on industrial action. Only limited amount of fuel available, which is below the calculated fuel for the flight.					x	x	x	x		
			GND			Advise crew that there is a change of the load sheet figures during taxi to the runway. The crew may have limited time due to a calculated take-off time (CTOT) — ATC slot.	x								x	
			GND			Braking action reported 'medium'. The information is transmitted just before take-off. The flight is subject to a					x		x	x		

						calculated take-off time (CTOT) — ATC slot.										
EVAL or SBT	Navigation	C	GND	External NAV failure. Loss of GPS satellite, ANP exceeding RNP, loss of external NAV source(s)	Recognise a NAV degradation. Take appropriate action. Execute the appropriate procedure as applicable. Use alternative NAV guidance. Manage consequences.	External failure or a combination of external failures degrading aircraft navigation performance on ground	x		x				x	x		
			TO CLB APP LDG			External failure or a combination of external failures degrading aircraft navigation performance in flight		x				x	x	x		
			GND			Standard initial departure change during taxi. The flight may be subject to a CTOT — ATC slot.						x		x	x	
			APP			Loss of runway lighting below decision height		x					x	x		
			CRZ			No fly zone: when the crew changes control frequency, the new ATCO informs the crew that they are flying over an unannounced ‘no fly zone’ that is not included in the NOTAMs. (To trigger such an event, the context may be as follows: an unexpected military conflict in the territory the aircraft is flying over or the crew is forced to re-route in flight and the new route flies over a city that has an important event such the Olympic games, a G20/G7 summit, or the route is flying near a space rocket launch close to the time of the launch, like the Guiana Space Centre, Cape Cañaveral, etc.).							x	x	x	
	Operations- or type-specific	C	ALL	Intentionally blank	Intentionally blank	Intentionally blank	Intentionally blank									

	Operations of special airport approval	C	APP LDG	See equivalency of approaches relevant to operations.	The operator should comply with the national qualification requirements published in the aeronautical information publication (AIP).	Intentionally blank	Intentionally blank								
EVAL or SBT	Pilot incapacitation	C	TO	Consequences for the non-incapacitated pilot	Recognise incapacitation. Take appropriate action including correct stop/go decision. Apply the appropriate procedure correctly. Maintain aircraft control. Manage consequences.	During take-off	x	x			x	x			x
			APP			During approach	x			x			x	x	
EVAL or SBT	Runway or taxiway condition	C	GND TO LDG	Contamination or surface quality of the runway, taxiway, or tarmac including foreign objects	Recognise hazardous runway condition. Observe limitations. Take appropriate action. Apply the appropriate procedures correctly. Assure aircraft control.	Planned anticipated hazardous conditions with dispatch information provided to facilitate planning and execution of appropriate procedures						x			x
			GND TO LDG			Unanticipated hazardous conditions, e.g. unexpected heavy rain resulting in flooded runway surface		x			x	x			
			TO			Take-off on runway with reduced cleared width due to snow	x			x	x		x		
			TO			Stop/go decision in hazardous conditions					x	x		x	
EVAL or SBT	Traffic	C	CLB CRZ DES	Traffic conflict. ACAS RA or TA, or visual observation of conflict, which	Anticipate potential loss of separation. Recognise loss of separation.	ACAS warning that requires crew intervention		x				x	x	x	

				requires evasive manoeuvring	Take appropriate action. Apply the appropriate procedure correctly. Maintain aircraft control. Manage consequences.	Dilemma: Visual acquisition of conflicting traffic followed by an ACAS warning (resolution advisory) triggered by the same or other traffic. Even if the traffic is in sight, the pilot should follow the RA.	x		x	x						
						While in descent, ACAS warning (traffic advisory) of an aircraft below. The crew should not initiate an avoidance manoeuvre based on TA (except decreasing the rate of descent unless otherwise instructed by ATC, etc.). This example scenario can be done during climb with conflicting traffic above.	x				x	x				
	Wind shear recovery	C	TO	With or without warnings including predictive. A wind shear scenario is ideally combined with an adverse-weather scenario containing other elements.	Anticipate potential for wind shear. Avoid known wind shear or prepare for suspected wind shear. Recognise wind shear encounter. Take appropriate action. Apply the appropriate procedure correctly. Assure aircraft control. Recognise out of wind shear condition. Maintain or restore a safe flight path. Assess consequential issues and manage outcomes.	Predictive wind shear warning during take-off					x	x				
			TO			Wind shear encounter during take-off	x				x	x				
			TO			Wind shear encounter after rotation						x			x	
			TO			Predictive wind shear after rotation					x	x				
			APP			Predictive wind shear during approach	x				x	x				
			APP			Wind shear encounter during go-around	x				x	x			x	
			APP			Wind shear encounter during approach	x				x	x				

END GEN2 TURBOPROP

AMC7 ORO.FC232 EBT programme assessment and training topics

ED Decision 2021/002/R

GENERATION 1 (JET) — EBT PROGRAMME — TABLE OF ASSESSMENT AND TRAINING TOPICS

Given the very small number of turbo-jet aeroplanes of the first generation in current use in commercial air transport operations and the lack of appropriate FSTDs for recurrent training, it has not been deemed possible to provide a table of assessment and training topics for those aeroplanes and therefore it is not possible to apply EBT.

AMC8 ORO.FC.232 EBT programme assessment and training topics

ED Decision 2021/002/R

SCENARIO ELEMENTS AND COMPETENCY MAPPING

- (a) The operator may develop scenario elements and a competency map that are more relevant to its operation.
- (b) When developing scenario elements, the operator should ensure that there can be no negative training when asking pilots to induce their own errors.
- (c) Competencies mapped are those considered critical in managing the scenario. They are determined according to the following principles:
 - (1) those competencies considered most critical to the successful management of the defined threat or error; or
 - (2) those competencies most likely to be linked to the root cause of poor performance in the case of unsuccessful management of a defined threat or error.
- (d) The competency map may indicate scenarios or combinations of scenarios for development of particular competencies.
- (e) The competency map indicates the most critical competencies suggested by design, but the instructor should always assess all observed competencies.

GM1 ORO.FC.232 EBT programme assessment and training topics

ED Decision 2021/002/R

TABLE OF ASSESSMENT AND TRAINING TOPICS

- (a) The assessment and training topics usually have several example scenario elements. At least one example scenario element is selected (e.g. Gen 4 topic ‘Go-around’ in MT has three example scenario elements — the operator may choose one at each module (frequency A)).
- (b) Flight phase for activation:

Abbreviation	Flight phase	Description
GND (1)	Flight planning, preflight, engine start & taxi-out	Ground phases up to when the crew increases thrust for taking-off
	Taxi-in, engine shutdown, post-flight & flight closing	From the speed that permits the aircraft to be manoeuvred by means of taxiing for arriving at a parking area until the crew completes post-flight and flight closing duties.
TO (2)	Take-off	This phase begins when the crew increases the thrust for taking-off. It ends after the speed and configuration are established at a defined manoeuvring altitude or to continue the climb for cruise.
CLB (3)	Climb	This phase begins when the crew establishes the aircraft at a defined speed and configuration enabling the aircraft to increase altitude for the purpose of cruise. It ends with the aircraft established at a predetermined constant initial cruise altitude at a defined speed.
CRZ (4)	Cruise	The cruise phase begins when the crew establishes the aircraft at a defined speed and predetermined constant initial cruise altitude and

		proceeds in the direction of a destination. It ends with the beginning of descent for an approach.
DES (5)	Descent	This phase begins when the crew departs the cruise altitude for an approach at a particular destination. It ends when the crew initiates changes in aircraft configuration and/or speed to facilitate a landing on a particular runway.
APP (6)	Approach	This phase begins when the crew initiates changes in aircraft configuration and/or speeds enabling the aircraft to manoeuvre for landing on a particular runway. It ends when the aircraft is in the landing configuration and the crew is dedicated to land on a specific runway. It also includes go-around where the crew aborts the descent to the planned landing runway during the approach phase. Go-around ends after speed and configuration are established at a defined manoeuvring altitude or to continue the climb for cruise.
LDG (7)	Landing	This phase begins when the aircraft is in the landing configuration and the crew is dedicated to touchdown on a specific runway. It ends when the speed permits the aircraft to be manoeuvred by means of taxiing for arrival at a parking area.
ALL (8)	All	Any or all phases of flight

GM2 ORO.FC.232 EBT programme assessment and training topics

ED Decision 2021/002/R

COMPETENCY MAP PROCESS

Note 1. The competency map process may be done in teams of instructors. Then the results are compared and reconciled by a small group of subject matter experts (SMEs).

Note 2. It is always easy to map SAW or KNO as the underlying competency, but there are almost invariably other competencies, especially when there is ineffective management, so the intent should be to balance the mapping of SAW or KNO and map the other predominant competencies within the scenario.

AMC1 ORO.FC.232(b)(1) EBT programme assessment and training topics

ED Decision 2021/002/R

EBT DATA REPORT

- (a) The data report is a large-scale comprehensive study of operational data. It identifies the areas of pilot training for improvement, providing the prioritisation of germane and relevant training topics to guide in the construction of suitable EBT programmes. The data report uses other studies, a variety of data sources and/or varied methodology to mitigate the inherent bias associated with individual types of data sources.
- (b) The data report should:
 - (1) be endorsed or developed by the competent authority, EASA or ICAO;
 - (2) be reviewed by a team of experts in pilot training, representing airline operators, pilot associations, regulators, and original equipment manufacturers (OEM);

-
- (3) use data or information (training data, operational data and safety data) from the following sources:
 - (i) accident investigation bodies;
 - (ii) competent authorities;
 - (iii) OEM — aircraft;
 - (iv) EASA safety information;
 - (v) operators; and
 - (vi) studies or reports (aviation or scientific);
 - (4) analyse the data with the following objectives:
 - (i) to substantiate the need for change in the assessment and training programmes for commercial transport pilots;
 - (ii) to provide evidence from data analyses to support the derivation of training topics, prioritised according to aircraft generation;
 - (iii) to challenge and/or corroborate the other sources of data (e.g. Training Criticality Survey and Training Guidance) with operational data;
 - (iv) to provide feedback regarding the effectiveness of changes implemented through the adoption of competency-based training methodologies; and
 - (v) to validate or ascertain practices, findings or conclusions made previously by the industry;
 - (5) include the studies and define the use of such studies in the data report following the criteria below:
 - (i) The study is relevant from a training perspective (e.g. if incorporating a training change mitigates the risk found in the study).
 - (ii) There is evidence that it will assist with the identification of competencies to be developed in training in order to mitigate risks encountered in the evolving operational environment.
 - (iii) The findings of the study will be corroborative or challenging across the spectrum of the analysis made in the data report.
 - (iv) The study allows the analysis and comparison of the data or findings in the data report and it is coming from industry-respected research or studies;
 - (6) include an evidence table for the purpose of:
 - (i) integrating the evidence of the analyses in points (4) and (5);
 - (ii) identifying meaningful patterns;
 - (iii) enabling the grouping of evidence to support the key findings; and
 - (iv) facilitating the prioritisation of results; and
 - (7) include a prioritisation of the training topics for the purpose of translating data into useful events and scenarios to assess and develop pilot performance (assessment and training topics). The prioritisation shall:

- (i) systematically rank threats, errors and competencies along with the factors leading to accidents and serious incidents from multiple data sources to formulate a table of assessment and training topics;
- (ii) be performed for each of the generations of aircraft. This allows highlighting the differences and commonalities between generations; and
- (iii) ensure sufficient flexibility in the process to allow enhancement of the training programmes according to the type of operation, culture and type of aircraft.

AMC1 ORO.FC.232(b)(3) EBT programme assessment and training topics

ED Decision 2021/002/R

AIRCRAFT TYPES BY GENERATIONS

The operator should only develop an EBT programme for aircraft types for which there is a table of assessment and training topics.

Generation 4 — Jet)	<p>From 1988.</p> <p>EFIS cockpit — FMS equipped</p> <p>FADEC</p> <p>Fly-by-wire control systems</p> <p>Advanced flight envelope protection</p> <p>Integrated auto flight control system — navigation performance, and terrain avoidance systems</p> <p>Generation fatal accident average rate: 0,1/million flights</p>	<p>A318/A319/A320/A321 (including neo), A330, A340-200/300, A340-500/600, B777, A380, B787, A350, Bombardier C Series (A220), Embraer E170/E175/E190/E195</p>
Generation 3 — Jet	<p>From 1969</p> <p>EFIS cockpit — FMS equipped</p> <p>FADEC</p> <p>Integrated auto flight control system — navigation performance, and terrain avoidance systems</p> <p>Basic flight envelope protection — stick shaker/pusher</p> <p>Generation fatal accident average rate: 0,2/million flights</p>	<p>A310/A300-600, B737-300/400/500, B737-600/700/800 (NG), B737 MAX, B757, B767, B747-400, B747-8, B717, BAE 146, MD11, MD80, MD90, F70, F100, Bombardier CRJ Series, Embraer ERJ 135/145</p>
Generation 3 — Turboprop	<p>From 1992</p> <p>EFIS cockpit — FMS equipped</p> <p>EEC/ECU or higher engine control</p> <p>Integrated auto flight control system — navigation performance and terrain avoidance systems</p> <p>Basic flight envelope protection — stick shaker/pusher</p>	<p>ATR 42-600, ATR 72-600, Bombardier Dash 8-400, BAE ATP, Saab 2000</p>
Generation 2 — Jet	<p>From 1964.</p> <p>Integrated auto-flight system.</p> <p>EEC/ECU or higher engine control</p>	<p>A300 (except A300-600), BAC111, B727, B737-100/200,</p>

	Analogue/CRT instrument display Basic flight envelope protection — stick shaker/pusher Generation fatal accident average rate: 0,7/million flights	B747-100/200/300, DC9, DC10, F28, L1011
Generation 2 — Turboprop	From 1964 Analogue/CRT instrument display EEC/ECU Basic flight envelope protection — stick shaker/pusher Integrated auto flight control system	ATR 42, ATR 72 (all series except -600), BAE J-41, Fokker F27/50, Bombardier Dash 7 and Dash 8-100/200/300 Series, Convair 580-600 Series, Shorts 330 and 360, Saab 340, Embraer 120
Generation 1 — Jet	From 1952 First commercial jets. Manual engine control Analogue instrument display Not integrated auto flight control system Basic flight envelope protection — stick shaker/pusher, attitude warning Generation fatal accident average rate: 3.0/million flights	DC8, B707

ORO.FC.235 Pilot qualification to operate in either pilot's seat — aeroplanes

Regulation (EU) 2021/2237

- (a) Commanders of aeroplanes whose duties require them to operate in either pilot's seat and carry out the duties of a co-pilot, or commanders required to conduct training or checking duties shall complete additional training and checking to ensure that they are proficient in conducting the relevant normal, abnormal and emergency procedures from either seat. Such training and checking shall be specified in the operations manual. The checking may be conducted together with the operator proficiency check prescribed in [ORO.FC.230\(b\)](#) or in the EBT programme prescribed in [ORO.FC.231](#).
- (b) The additional training and checking shall include at least the following:
 - (1) an engine failure during take-off;
 - (2) a one-engine-inoperative approach and go-around; and
 - (3) a one-engine-inoperative landing.
- (c) The validity period shall be 12 calendar months. For operators with an approved EBT programme, the validity is determined by the assessment and training topics in accordance with [ORO.FC.232](#).
- (d) When operating in the co-pilot's seat, the checks required by [ORO.FC.230](#) or the assessment and training required by [ORO.FC.231](#) for operating in the commander's seat shall, in addition, be valid and current.
- (e) The pilot relieving the commander shall have demonstrated, concurrent with the operator proficiency checks prescribed in [ORO.FC.230\(b\)](#) or the assessment and training required by

[ORO.FC.231](#), practice of drills and procedures that would not normally be his or her responsibility. Where the differences between left- and right-hand seats are not significant, practice may be conducted in either seat.

- (f) The pilot, other than the commander, occupying the commander's seat shall demonstrate practice of drills and procedures, concurrent with the operator proficiency checks prescribed in [ORO.FC.230\(b\)](#) or the assessment and training required by [ORO.FC.231](#), which are the commander's responsibility acting as pilot monitoring. Where the differences between left- and right-hand seats are not significant, practice may be conducted in either seat.

GM1 ORO.FC.235(e);(f) Pilot qualification to operate in either pilot's seat

ED Decision 2022/014/R

DIFFERENCES BETWEEN LEFT AND RIGHT-HAND SEATS

The differences between left- and right-hand seats may not be significant in cases where, for example, the autopilot is used.

ORO.FC.236 Pilot qualification to operate in either pilot's seat — helicopters

Regulation (EU) 2021/2237

- (a) Helicopter pilots whose duties require them to operate in either pilot's seat shall complete additional training and checking to ensure that they are proficient in conducting the relevant normal, abnormal and emergency procedures from either seat. The validity period of this qualification shall be 12 calendar months.
- (b) Current FIs or TRIs on the relevant type are considered to fulfil the requirement of point (a) if they have had a FI or TRI activity in the last 6 months on that type and on the helicopter.

AMC1 ORO.FC.236 Pilot qualification to operate in either pilot's seat — helicopters

ED Decision 2022/014/R

GENERAL

- (a) The operator should either conduct a check every year or alternate training and checking every year. The training and checking may take place during or together with an operator proficiency check or an aircraft/FSTD training session.
- (b) When engine-out manoeuvres are carried out in an aircraft, the engine failure should be simulated.
- (c) Helicopter pilots should meet one of the following criteria:
- (1) complete their operator proficiency checks from left- and right-hand seats, on alternate proficiency checks; or
 - (2) for multi-engined helicopters, if two consecutive operator proficiency checks are conducted from the same seat, the pilot should complete at least the following from the other pilot's seat:
 - (i) an engine failure during take-off;

- (ii) a one-engine-inoperative approach and go-around; and
- (iii) a one-engine-inoperative landing;
- (3) for single-engined helicopters, if two consecutive operator proficiency checks are conducted from the same seat, the pilot should complete at least one autorotation training or checking from the other pilot's seat.

GM1 ORO.FC.236 Pilot qualification to operate in either pilot's seat — helicopters

ED Decision 2022/014/R

QUALIFICATION TO FLY IN EITHER PILOT'S SEAT — NOMINATED COMMANDER CONDUCTING LINE CHECKS

In the case of a line check revalidation of a fully qualified commander in single-pilot operations, the line checker does not require a qualification to operate in either pilot's seat, regardless of the seat he or she occupies, provided that the line checker has no pilot duties other than checking.

ORO.FC.240 Operation on more than one type or variant

Regulation (EU) 2021/2237

- (a) The procedures or operational restrictions for operation on more than one type or variant established in the operations manual and approved by the competent authority shall cover:
 - (1) the flight crew members' minimum experience level;
 - (2) the minimum experience level on one type or variant before beginning training for and operation of another type or variant;
 - (3) the process whereby flight crew qualified on one type or variant will be trained and qualified on another type or variant; and
 - (4) all applicable recent experience requirements for each type or variant.
- (b) INTENTIONALLY LEFT BLANK
- (c) Point (a) shall not apply to operations of performance class B aeroplanes if they are limited to single-pilot classes of reciprocating engine aeroplanes under VFR by day.

AMC1 ORO.FC.240 Operation on more than one type or variant

ED Decision 2022/014/R

GENERAL

- (a) Aeroplanes
 - (1) When a flight crew member operates more than one aeroplane class, type or variant, as determined by the operational suitability data established in accordance with [Commission Regulation \(EU\) No 748/2012](#) for class-single pilot or type-single pilot, but not within a single licence endorsement, the operator should ensure that the flight crew member does not operate more than:
 - (i) three reciprocating engine aeroplane types or variants;
 - (ii) three turbo-propeller aeroplane types or variants;
 - (iii) one turbo-propeller aeroplane type or variant and one reciprocating engine aeroplane type or variant; or

- (iv) one turbo-propeller aeroplane type or variant and any aeroplane within a particular class.
- (2) When a flight crew member operates more than one aeroplane type or variant within one or more licence endorsement, as determined by the operational suitability data established in accordance with [Commission Regulation \(EU\) No 748/2012](#), the operator should ensure that:
 - (i) the minimum flight crew complement specified in the operations manual is the same for each type or variant to be operated;
 - (ii) the flight crew member does not operate more than two aeroplane types or variants for which a separate licence endorsement is required, unless credits related to the training, checking, and recent experience requirements are defined in the operational suitability data established in accordance with [Commission Regulation \(EU\) No 748/2012](#) for the relevant types or variants; and
 - (iii) only aeroplanes within one licence endorsement are flown in any one flight duty period, unless the operator has established procedures to ensure adequate time for preparation.
- (3) When a flight crew member operates more than one aeroplane type or variant as determined by the operational suitability data established in accordance with [Commission Regulation \(EU\) No 748/2012](#) for type-single pilot and type-multi pilot, but not within a single licence endorsement, the operator should comply with points (a)(2) and (4).
- (4) When a flight crew member operates more than one aeroplane type or variant as determined by the operational suitability data established in accordance with [Commission Regulation \(EU\) No 748/2012](#) for type multi-pilot, but not within a single licence endorsement, or combinations of aeroplane types or variants as determined by the operational suitability data established in accordance with [Commission Regulation \(EU\) No 748/2012](#) for class single-pilot and type multi-pilot, the operator should comply with the following:
 - (i) point (a)(2);
 - (ii) before exercising the privileges of more than one licence endorsement:
 - (A) flight crew members should have completed two consecutive OPCs and should have:
 - 500 hours in the relevant crew position in CAT operations with the same operator; or
 - for IFR and VFR night operations with performance class B aeroplanes, 100 hours or flight sectors in the relevant crew position in CAT operations with the same operator, if at least one licence endorsement is related to a class. A check flight should be completed before the pilot is released for duties as commander;
 - (B) in the case of a pilot having experience with an operator and exercising the privileges of more than one licence endorsement, and then being promoted to command with the same operator on one of those types, the required minimum experience as commander is 6 months and 300 hours, and the pilot should have completed two consecutive OPCs before again being eligible to exercise more than one licence endorsement;

- (iii) before commencing training for and operation of another type or variant, flight crew members should have completed 3 months and 150 hours flying on the base aeroplane, which should include at least one proficiency check, unless credits related to the training, checking and recent experience requirements are defined in the operational suitability data established in accordance with [Commission Regulation \(EU\) No 748/2012](#) for the relevant types or variants;
- (iv) after completion of the initial line check on the new type, 50 hours flying or 20 sectors should be achieved solely on aeroplanes of the new type rating, unless credits related to the training, checking and recent experience requirements are defined in the operational suitability data established in accordance with [Commission Regulation \(EU\) No 748/2012](#) for the relevant types or variants;
- (v) recent experience requirements established in [Commission Regulation \(EU\) No 1178/2011](#) for each type operated;
- (vi) the period within which line flying experience is required on each type should be specified in the operations manual;
- (vii) when credits are defined in the operational suitability data established in accordance with [Commission Regulation \(EU\) No 748/2012](#) for the relevant type or variant, this should be reflected in the training required in [ORO.FC.230](#) and:
 - (A) [ORO.FC.230 \(b\)](#) requires two OPCs every year. When credits are defined in the operational suitability data established in accordance with [Commission Regulation \(EU\) No 748/2012](#) for OPCs to alternate between the types, each OPC should revalidate the OPC for the other type(s). The OPC may be combined with the proficiency checks for revalidation or renewal of the aeroplane type rating or the instrument rating in accordance with [Commission Regulation \(EU\) No 1178/2011](#). For EBT programmes, [ORO.FC.231\(a\)\(3\)](#) requires the pilot to complete a minimum of two modules of the EBT programme, separated by a period of more than 3 months, within a 12-month period. In addition, the pilot is required to be trained according to assessment and training topics distributed across a 3-year period at the defined frequency relevant to the type or variant of aircraft. When credits are defined in the operational suitability data established in accordance with [Commission Regulation \(EU\) No 748/2012](#), EBT modules should alternate between types. The EBT modules may be combined for revalidation or renewal of the aeroplane type rating or the instrument rating in accordance with [Commission Regulation \(EU\) No 1178/2011](#). When operating more than one type of different generations, the operator has to fulfil both generation table of assessment and training topics as per [ORO.FC.232](#).
 - (B) [ORO.FC.230 \(c\)](#) requires one line check every year. When credits are defined in the operational suitability data established in accordance with [Commission Regulation \(EU\) No 748/2012](#) for line checks to alternate between types or variants, each line check should revalidate the line check for the other type or variant. For EBT programmes, [ORO.FC.231\(h\)](#) requires one line evaluation of competence every year. When credits are defined in the operational suitability data established in accordance with [Commission Regulation \(EU\) No 748/2012](#) for line evaluation of competence to alternate between types or variants, each line evaluation of competence should

revalidate the line evaluation of competence for the other type or variant. In such case, the operator should meet the requirements to extend the validity of the line evaluation of competence to 2 years. Extension to 3 years should not be allowed.

- (C) Annual emergency and safety equipment training and checking should cover all requirements for each type.

(b) Helicopters

- (1) If a flight crew member operates more than one type or variant, the following provisions should be met:
 - (i) The recency requirements and the requirements for recurrent training and checking should be met and confirmed prior to CAT operations on any type, and the minimum number of flights on each type within a 3 months' period specified in the operations manual.
 - (ii) [ORO.FC.230](#) requirements with regard to recurrent training.
 - (iii) When credits related to the training, checking and recent experience requirements are defined in operational suitability data established in accordance with [Commission Regulation \(EU\) No 748/2012](#) for the relevant types or variants, the requirements of [ORO.FC.230](#) with regard to proficiency checks may be met by a 6 monthly check on any one type or variant operated. However, a proficiency check on each type or variant operated should be completed every 12 months.
 - (iv) If a helicopter has a maximum certified take-off mass (MCTOM) of more than 5 700 kg or a maximum operational passenger seating configuration (MOPSC) of more than 19:
 - (A) the flight crew member should not fly more than two helicopter types, unless credits related to the training, checking and recent experience requirements are defined in operational suitability data established in accordance with [Commission Regulation \(EU\) No 748/2012](#) for the relevant types or variants;
 - (B) a minimum of 3 months and 150 hours experience on the type should be achieved before the flight crew member should commence the conversion course onto the new type or variant, unless credits related to the training, checking and recent experience requirements are defined in the operational suitability data established in accordance with [Commission Regulation \(EU\) No 748/2012](#) for the relevant types or variants;
 - (C) 28 flying days or 50 hours experience should then be achieved exclusively on the new type or variant, unless credits related to the training, checking and recent experience requirements are defined in the operational suitability data established in accordance with [Commission Regulation \(EU\) No 748/2012](#) for the relevant types or variants; and
 - (D) a flight crew member should not be rostered to fly more than one type during a single duty period unless the following conditions are met:
 - There should be sufficient time off between the two types for a comprehensive training or self-training on the differences between the types. The time off should not include flight preparation duties.

- The training referred in the previous paragraph should include time in flight or in the cockpit or in a device representative of the cockpit of the next type to be flown.
 - The training syllabus should be based on a risk assessment of the operator and be described in the operations manual. The training should take place every time the pilot changes types, whether within the same duty period or not.
- (v) In the case of all other helicopters, the flight crew member should not operate more than three helicopter types or groups of types in CAT, NCC and SPO, unless credits related to the training, checking and recent experience requirements are defined in the operational suitability data established in accordance with [Commission Regulation \(EU\) No 748/2012](#) for the relevant types or variants.
- (vi) The operator should only define a group of types for the purpose of this AMC if the following conditions are met:
 - (A) A group of helicopter types should either include only single-engined turbine helicopters operated only under VFR or it should include only single-engined piston helicopters operated only under VFR.
 - (B) The operator should define conditions for flying more than one type or variant on the same day, including sufficient time for a briefing or self-briefing on changing types or variants.
 - (C) The operator should define the maximum number of types and variants that can be flown on the same day.
- (vii) Points (v) and (vi) above apply whenever a flight crew member operates more than one type or variant in CAT.
- (c) Combination of helicopter and aeroplane
 - (1) The flight crew member should only operate a combination of helicopters and aeroplanes if one of the following conditions is met:
 - (i) operations under CAT, NCC and SPO should be limited to one type or class of aeroplane and one helicopter type; or
 - (ii) operations under CAT, NCC and SPO should be limited to one type or class of aeroplane and one group of helicopter types defined in (b)(vi) above; or
 - (iii) operations under CAT, NCC and SPO should be limited to only performance class B aeroplanes from the single-pilot classes of reciprocating engine aeroplanes and one helicopter type or group of helicopter types defined in (b)(vi) above.
 - (2) If a helicopter type is covered by point (b)(1)(iv), then (b)(1)(iv)(B), (C) and (D) should also apply in this case.

ORO.FC.A.245 Alternative training and qualification programme

Regulation (EU) 2021/2237

- (a) The aeroplane operator having appropriate experience may substitute one or more of the following training and checking requirements for flight crew by an alternative training and qualification programme (ATQP), approved by the competent authority:
 - (1) set out in point [SPA.LVO.120](#) on flight crew training and qualifications;

- (2) set out in point [ORO.FC.220](#) on conversion training and checking;
 - (3) set out in point [ORO.FC.125](#) on differences training, familiarisation, equipment and procedure training;
 - (4) set out in point [ORO.FC.205](#) on command course;
 - (5) set out in point [ORO.FC.230](#) on recurrent training and checking; and
 - (6) set out in point [ORO.FC.240](#) on operation on more than one type or variant.
- (b) The ATQP shall contain training and checking that establishes and maintains at least an equivalent level of proficiency achieved by complying with the provisions of [ORO.FC.220](#) and [ORO.FC.230](#). The level of flight crew training and qualification proficiency shall be demonstrated prior to being granted the ATQP approval by the competent authority.
- (c) The operator applying for an ATQP approval shall provide the competent authority with an implementation plan, including a description of the level of flight crew training and qualification proficiency to be achieved.
- (d) In addition to the checks required by points [ORO.FC.230](#) and FCL.060 of Annex I (Part-FCL) to [Regulation \(EU\) No 1178/2011](#), each flight crew member shall complete a line oriented evaluation (LOE) conducted in an FSTD. The validity period of an LOE shall be 12 calendar months. The LOE is completed when both of the following conditions are met:
- (1) the syllabus of the LOE is completed; and
 - (2) the flight crew member has demonstrated an acceptable level of performance.
- (e) After 2 years of operating with an approved ATQP, the operator may, with the approval of the competent authority, extend the validity periods of the checks referred to in point [ORO.FC.230](#) as follows:
- (1) Operator proficiency check to 12 calendar months.
 - (2) Line check to 24 calendar months.
 - (3) Emergency and safety equipment checking to 24 calendar months.
- (f) Each flight crew member shall undergo specific modular CRM training. All major topics of CRM training shall be covered by distributing modular training sessions as evenly as possible over each 3-year period.
- (g) The ATQP programme shall include 48 hours on an FSTD for each flight crew member, distributed evenly over a 3-year programme. The operator may reduce the number of FSTD hours, but no lower than 36 hours, provided that it demonstrates that the level of safety that is achieved is equivalent to that of the programme the ATQP may substitute in accordance with point (a).

AMC1 ORO.FC.A.245 Alternative training and qualification programme

ED Decision 2015/005/R

COMPONENTS AND IMPLEMENTATION

- (a) Alternative training and qualification programme (ATQP) components

The ATQP should comprise the following:

- (1) Documentation that details the scope and requirements of the programme, including the following:
 - (i) The programme should demonstrate that the operator is able to improve the training and qualification standards of flight crew to a level that exceeds the standards prescribed in ORO.FC and Subpart E of Annex V (SPA.LVO).
 - (ii) The operator's training needs and established operational and training objectives.
 - (iii) A description of the process for designing and gaining approval for the operator's flight crew qualification programmes. This should include quantified operational and training objectives identified by the operator's internal monitoring programmes. External sources may also be used.
 - (iv) A description of how the programme will:
 - (A) enhance safety;
 - (B) improve training and qualification standards of flight crew;
 - (C) establish attainable training objectives;
 - (D) integrate CRM in all aspects of training;

[point (D) applicable until 25 March 2023 — ED Decision 2022/014/R]

(D) integrate CRM in all aspects of training and ensure that each flight crew member undergoes specific modular CRM training. All major topics of CRM training should be covered by distributing modular training sessions as evenly as possible over each 3-year period;

[point (D) applicable from 26 March 2023 — ED Decision 2022/014/R]

 - (E) develop a support and feedback process to form a self-correcting training system;
 - (F) institute a system of progressive evaluations of all training to enable consistent and uniform monitoring of the training undertaken by flight crew;
 - (G) enable the operator to be able to respond to new aeroplane technologies and changes in the operational environment;
 - (H) foster the use of innovative training methods and technology for flight crew instruction and the evaluation of training systems; and
 - (I) make efficient use of training resources, specifically to match the use of training media to the training needs.
- (2) A task analysis to determine:
 - (i) knowledge;
 - (ii) required skills;
 - (iii) associated skill-based training; and
 - (iv) validated behavioural markers, where appropriate.

For each aeroplane type/class to be included within the ATQP the operator should establish a systematic review that determines and defines the various tasks to be undertaken by the flight crew when operating that type/class. Data from other types/classes may also be used. The analysis should determine and describe the

knowledge and skills required to complete the various tasks specific to the aeroplane type/class and/or type of operation. In addition, the analysis should identify the appropriate behavioural markers that should be exhibited. The task analysis should be suitably validated in accordance with (b)(3). The task analysis, in conjunction with the data gathering programme(s), permits the operator to establish a programme of targeted training together with the associated training objectives.

- (3) Curricula. The curriculum structure and content should be determined by task analysis, and should include proficiency objectives, including when and how these objectives should be met.
 - (i) The training programme should have the following structure:
 - (A) Curriculum, specifying the following elements:
 - (a) Entry requirements: a list of topics and content, describing what training level will be required before start or continuation of training.
 - (b) Topics: a description of what will be trained during the lesson.
 - (c) Targets/Objectives
 - (1) Specific target or set of targets that have to be reached and fulfilled before the training course can be continued.
 - (2) Each specified target should have an associated objective that is identifiable both by the flight crew and the trainers.
 - (3) Each qualification event that is required by the programme should specify the training that is required to be undertaken and the required standard to be achieved.
 - (B) Daily lesson plan
 - (a) Each lesson/course/training or qualification event should have the same basic structure. The topics related to the lesson should be listed and the lesson targets should be unambiguous.
 - (b) Each lesson/course or training event whether classroom, CBT or simulator should specify the required topics with the relevant targets to be achieved.
 - (ii) A specific training programme for:
 - (i) each aeroplane type/class within the ATQP;
 - (ii) instructors (class rating instructor rating/synthetic flight instructor authorisation/type rating instructor rating — CRI/SFI/TRI), and other personnel undertaking flight crew instruction; and
 - (iii) examiners (class rating examiner/synthetic flight examiner/type rating examiner — CRE/SFE/TRE).

This should include a method for the standardisation of instructors and examiners.

Personnel who perform training and checking of flight crew in an operator's ATQP should receive the following additional training on:

- (A) ATQP principles and goals;
- (B) knowledge/skills/behaviour as learnt from task analysis;

- (C) line-oriented evaluation (LOE)/ LOFT scenarios to include triggers/markers/event sets/observable behaviour;
- (D) qualification standards;
- (E) harmonisation of assessment standards;
- (F) behavioural markers and the systemic assessment of CRM;
- (G) event sets and the corresponding desired knowledge/skills and behaviour of the flight crew;
- (H) the processes that the operator has implemented to validate the training and qualification standards and the instructors part in the ATQP quality control; and
- (I) line-oriented quality evaluation (LOQE).

[points (A)-(I) applicable until 25 March 2023 — ED Decision 2022/014/R]

- (A) ATQP principles and goals;
- (B) knowledge/skills/behavioural markers as learnt from task analysis;
- (C) line-oriented evaluation (LOE)/LOFT scenarios to include triggers/behavioural markers/event sets/observable behaviour;
- (D) qualification standards;
- (E) harmonisation of assessment standards;
- (F) behavioural markers and the systemic assessment of CRM;
- (G) event sets and the corresponding desired knowledge/skills and behavioural markers of the flight crew;
- (H) the processes that the operator has implemented to validate the training and qualification standards and the instructors part in the ATQP quality control; and
- (I) line-oriented quality evaluation (LOQE).

[points (A)-(I) applicable from 26 March 2023 — ED Decision 2022/014/R]

- (5) A feedback loop for the purpose of curriculum validation and refinement, and to ascertain that the programme meets its proficiency objectives.
 - (i) The feedback should be used as a tool to validate that the curricula are implemented as specified by the ATQP; this enables substantiation of the curriculum, and that proficiency and training objectives have been met. The feedback loop should include data from operations flight data monitoring, the advanced flight data monitoring (FDM) programme and LOE/LOQE programmes. In addition, the evaluation process should describe whether the overall targets/objectives of training are being achieved and should prescribe any corrective action that needs to be undertaken.
 - (ii) The programme's established quality control mechanisms should at least review the following:
 - (A) procedures for approval of recurrent training;
 - (B) ATQP instructor training approvals;

- (C) approval of event set(s) for LOE/LOFT;
 - (D) procedures for conducting LOE and LOQE.
- (6) A method for the assessment of flight crew during conversion and recurrent training and checking. The assessment process should include event-based assessment as part of the LOE. The assessment method should comply with [ORO.FC.230](#).
- (i) The qualification and checking programmes should include at least the following elements:
 - (A) a specified structure;
 - (B) elements to be tested/examined;
 - (C) targets and/or standards to be attained;
 - (D) the specified technical and procedural knowledge and skills, and behavioural markers to be exhibited.
 - (ii) An LOE event should comprise tasks and sub-tasks performed by the crew under a specified set of conditions. Each event has one or more specific training targets/objectives, which require the performance of a specific manoeuvre, the application of procedures, or the opportunity to practise cognitive, communication or other complex skills. For each event the proficiency that is required to be achieved should be established. Each event should include a range of circumstances under which the crews' performance is to be measured and evaluated. The conditions pertaining to each event should also be established and they may include the prevailing meteorological conditions (ceiling, visibility, wind, turbulence, etc.), the operational environment (navigation aid inoperable, etc.), and the operational contingencies (non-normal operation, etc.).
 - (iii) The markers specified under the operator's ATQP should form one of the core elements in determining the required qualification standard. A typical set of markers is shown in the table below:

EVENT	MARKER
Awareness of aeroplane systems:	1. Monitors and reports changes in automation status
	2. Applies closed loop principle in all relevant situations
	3. Uses all channels for updates
	4. Is aware of remaining technical resources

- (iv) The topics/targets integrated into the curriculum should be measurable and progression on any training/course is only allowed if the targets are fulfilled.
- (v) The assessment and the subsequent grading of the performance of flight crew members should include the following steps:
 - (A) Observe performance (behaviours) during the simulator session.
 - (B) Record details of effective and ineffective performance (behaviours) observed during the simulator session ('record' in this context refers to instructors taking notes).
 - (C) Classify observations against the set of behavioural markers and allocate the behavioural markers to each type of knowledge or skill or task, using amongst others the facilitation technique. If the operator has developed a

set of competencies, it may allocate the behavioural markers to each competency.

- (D) Assess and evaluate (grade): assess the performance by determining the root cause(s). Low performance would normally indicate the area of performance to be remediated in subsequent phases or modules or training sessions. Evaluate (grade) the performance by determining a grade using the methodology defined by the operator.

[point (v) applicable from 26 March 2023 — ED Decision 2022/014/R]

- (7) A data monitoring/analysis programme consisting of the following:
- (i) A flight data monitoring (FDM) programme, as described in [AMC1 ORO.AOC.130](#). Data collection should reach a minimum of 60 % of all relevant flights conducted by the operator before ATQP approval is granted. This proportion may be increased as determined by the competent authority.
 - (ii) An advanced FDM when an extension to the ATQP is requested: an advanced FDM programme is determined by the level of integration with other safety initiatives implemented by the operator, such as the operator's safety management system. The programme should include both systematic evaluations of data from an FDM programme and flight crew training events for the relevant crews. Data collection should reach a minimum of 80 % of all relevant flights and training conducted by the operator. This proportion may be varied as determined by the competent authority.

The purpose of an FDM or advanced FDM programme for ATQP is to enable the operator to:

 - (A) provide data to support the programme's implementation and justify any changes to the ATQP;
 - (B) establish operational and training objectives based upon an analysis of the operational environment; and
 - (C) monitor the effectiveness of flight crew training and qualification.
 - (iii) Data gathering: the data analysis should be made available to the person responsible for ATQP within the organisation. The data gathered should:
 - (A) include all fleets that are planned to be operated under the ATQP;
 - (B) include all crews trained and qualified under the ATQP;
 - (C) be established during the implementation phase of ATQP; and
 - (D) continue throughout the life of the ATQP.
 - (iv) Data handling: the operator should establish a procedure to ensure the confidentiality of individual flight crew members, as described by [AMC1 ORO.AOC.130](#).
 - (v) The operator that has a flight data monitoring programme prior to the proposed introduction of ATQP may use relevant data from other fleets not part of the proposed ATQP.

(b) Implementation. The operator should develop an evaluation and implementation process, including the following stages:

(1) A safety case that demonstrates equivalency of:

- (i) the revised training and qualification standards compared to the standards of ORO.FC and/or Subpart E of Annex V (SPA.LVO) prior to the introduction of ATQP; and
- (ii) any new training methods implemented as part of ATQP.

The safety case should encompass each phase of implementation of the programme and be applicable over the lifetime of the programme that is to be overseen. The safety case should:

- demonstrate the required level of safety;
- ensure the required safety is maintained throughout the lifetime of the programme; and
- minimise risk during all phases of the programme's implementation and operation.

The elements of a safety case include:

- planning: integrated and planned with the operation (ATQP) that is to be justified;
- criteria;
- safety-related documentation, including a safety checklist;
- programme of implementation to include controls and validity checks; and
- oversight, including review and audits.

Criteria for the establishment of a safety case. The safety case should:

- be able to demonstrate that the required or equivalent level of safety is maintained throughout all phases of the programme;
- be valid to the application and the proposed operation;
- be adequately safe and ensure the required regulatory safety standards or approved equivalent safety standards are achieved;
- be applicable over the entire lifetime of the programme;
- demonstrate completeness and credibility of the programme;
- be fully documented;
- ensure integrity of the operation and the maintenance of the operations and training infrastructure;
- ensure robustness to system change;
- address the impact of technological advance, obsolescence and change; and
- address the impact of regulatory change.

(2) A task analysis, as required by (a)(2), to establish the operator's programme of targeted training and the associated training objectives.

- (3) A period of operation whilst data is collected and analysed to validate the safety case and task analysis. During this period the operator should continue to operate in accordance with ORO.FC and/or Subpart E of Annex V (SPA.LVO), as applicable. The length of this period should be determined by the competent authority.

GM1 ORO.FC.A.245 Alternative training and qualification programme

ED Decision 2014/017/R

TERMINOLOGY

- (a) 'Line-oriented evaluation (LOE)' is an evaluation methodology used in the ATQP to evaluate trainee performance, and to validate trainee proficiency. LOEs consist of flight simulator scenarios that are developed by the operator in accordance with a methodology approved as part of the ATQP. The LOE should be realistic and include appropriate weather scenarios and, in addition, should fall within an acceptable range of difficulty. The LOE should include the use of validated event sets to provide the basis for event-based assessment.
- (b) 'Line-oriented quality evaluation (LOQE)' is one of the tools used to help evaluate the overall performance of an operation. LOQEs consist of line flights that are observed by appropriately qualified operator personnel to provide feedback to validate the ATQP. The LOQE should be designed to look at those elements of the operation that are unable to be monitored by FDM or Advanced FDM programmes.
- (c) 'Skill-based training' requires the identification of specific knowledge and skills. The required knowledge and skills are identified within an ATQP as part of a task analysis and are used to provide targeted training.
- (d) 'Event-based assessment' is the assessment of flight crew to provide assurance that the required knowledge and skills have been acquired. This is achieved within an LOE. Feedback to the flight crew is an integral part of event-based assessment.
- (e) Safety case means a documented body of evidence that provides a demonstrable and valid justification that the ATQP is adequately safe for the given type of operation.

GM2 ORO.FC.A.245 Alternative training and qualification programme

ED Decision 2015/027/R

EVIDENCE-BASED RECURRENT TRAINING AND CHECKING OF FLIGHT CREW CONDUCTED IN FLIGHT SIMULATION TRAINING DEVICES (FSTDs)

It is possible to implement EBT in accordance with ICAO Doc 9995 in the framework of an approved alternative training and qualification programme (ATQP). [GM1 ORO.FC.230\(a\);\(b\);\(f\)](#) may be used to guide the operator towards EBT according to [ORO.FC.A.245](#) of Commission Regulation (EU) No 965/2012.

An operator holding approval for ATQP and wishing to implement EBT may use the guidance material in [GM1 ORO.FC.230\(a\);\(b\);\(f\)](#) for the conduct of the Licence Proficiency Check, or where the Licence Proficiency Check and Operator Proficiency Check are combined. For this purpose, the evaluation phase is equivalent to the line-oriented evaluation (LOE) described in [ORO.FC.A.245\(d\)](#).

GM3 ORO.FC.A.245 Alternative training and qualification programme

ED Decision 2022/014/R

BEHAVIOURAL MARKERS AND OBSERVABLE BEHAVIOURS — ATQP & EBT

- (b) Behavioural markers in ATQP are observable behaviours that contribute to superior or substandard performance within a flight (including pre-flight and post-flight duties).
- (c) A good behavioural marker:
 - (1) describes a specific, observable behaviour, not an attitude or personality trait, with clear definition (enactment of skills or knowledge is shown in behaviour);
 - (2) has demonstrated a causal relationship to performance outcome, without necessarily being present in all situations, and with its appropriateness possibly depending on context;
 - (3) uses simple phraseology; and
 - (4) describes a clear concept.
- (d) The characteristics of good behavioural marker systems are:
 - (1) validity: in relation to performance outcome;
 - (2) reliability: instructor or examiner concordance (inter-rater reliability), internal consistency;
 - (3) sensitivity: in relation to levels of performance;
 - (4) transparency: the pilots receiving the training or checking understand the performance criteria against which they are being rated; availability of reliability and validity data;
 - (5) usability: easy to train, simple framework, easy to understand, domain-appropriate language, sensitive to rater (i.e. examiner, instructor) workload, easy to observe;
 - (6) ability to provide a focus for training goals and needs; and
 - (7) minimal overlap between components.
- (e) For EBT mixed implementation, the operator may refer to the Annex I definitions of 'behaviour' and 'observable behaviour' which include the concept of behavioural marker in ATQP. In other words, the EBT OBs may be used as behavioural markers under ATQP.

AMC1 ORO.FC.A.245(a) Alternative training and qualification programme

ED Decision 2014/017/R

OPERATOR EXPERIENCE

The appropriate experience should be at least 2 years' continuous operation.

AMC1 ORO.FC.A.245(d)(e)(2) Alternative training and qualification programme

ED Decision 2014/017/R

COMBINATION OF CHECKS

- (a) The line-orientated evaluation (LOE) may be undertaken with other ATQP training.
- (b) The line check may be combined with a line-oriented quality evaluation (LOQE).

[applicable until 25 March 2023 — ED Decision 2022/014/R]

AMC1 ORO.FC.A.245(d);(e)(2) Alternative training and qualification programme

ED Decision 2022/014/R

COMBINATION OF CHECKS

- (a) The LOE may be undertaken with other ATQP training. The operator should ensure that training and checking are clearly distinguished and described in the operations manual.
- (b) The line check may be combined with a line-oriented quality evaluation (LOQE).
- (c) Complementary CRM assessment

The CRM assessment should take place in a line-oriented flight scenario (LOFT, LOE or line-oriented section of the OPC) of an FSTD session. This assessment complements the CRM assessment taking place during the line check /LOQE, but it is not part of the line check / LOQE.

[applicable from 26 March 2023]

GM1 ORO.FC.A.245(e)(2) Alternative training and qualification programme

ED Decision 2022/014/R

LINE CHECK IN MIXED FLEET OPERATION UNDER ATQP

The extension of validity for the line check is intended for single fleet operation. For mixed fleet operation, the operator needs to observe the provisions in the operational suitability data established in accordance with [Commission Regulation \(EU\) No 748/2012](#). Usually the operational suitability data refers to one line check per year in alternate aircraft types.

AMC1 ORO.FC.A.245(g) Alternative training and qualification programme

ED Decision 2022/014/R

ATQP PROGRAMME — FSTD

The FSTD qualification level should be adequate to complete proficiency checks; therefore, the ATQP programme should be conducted in a full-flight simulator (FFS) level C or D.

ORO.FC.A.250 Commanders holding a CPL(A)

Regulation (EU) 2017/363

- (a) The holder of a CPL(A) (aeroplane) shall only act as commander in commercial air transport on a single-pilot aeroplane if either of the following conditions is met:
- (1) when carrying passengers under VFR outside a radius of 50 NM (90 km) from an aerodrome of departure, he/she has a minimum of 500 hours of flight time on aeroplanes or holds a valid instrument rating; or
 - (2) when operating on a multi-engine type under IFR, he/she has a minimum of 700 hours of flight time on aeroplanes, including 400 hours as pilot-in-command. These hours shall include 100 hours under IFR and 40 hours in multi-engine operations. The 400 hours as pilot-in-command may be substituted by hours operating as co-pilot within an established multi-pilot crew system prescribed in the operations manual, on the basis of two hours of flight time as co-pilot for one hour of flight time as pilot-in command;
 - (3) when operating on a single-engined aeroplane under IFR, he/she has a minimum of 700 hours of flight time on aeroplanes, including 400 hours as pilot-in-command. Those hours shall include 100 hours under IFR. The 400 hours as pilot-in-command may be substituted by hours operating as co-pilot within an established multi-pilot crew system prescribed in the operations manual, on the basis of two hours of flight time as co-pilot for one hour of flight time as pilot-in command.
- (b) For operations under VFR by day of performance class B aeroplanes (a)(1) shall not apply.

ORO.FC.H.250 Commanders holding a CPL(H)

Regulation (EU) 2021/2237

- (a) Holders of a CPL(H) (helicopter) shall only act as commanders in CAT operations on a single-pilot helicopter if:
- (1) when operating under IFR, they have a minimum of 700 hours total flight time on helicopters, including 300 hours as pilot-in-command. The total flight time on helicopters shall include 100 hours under IFR. Up to 50 hours instrument time performed on an FFS(H) level B or FTD level 3 qualification or higher qualified for instrument training, may be credited towards the 100 hours. The 300 hours as pilot-in-command may be substituted by hours operating as co-pilot within an established multi-pilot crew system prescribed in the operations manual on the basis of 2 hours of flight time as co-pilot for 1 hour flight time as pilot-in command;
 - (2) when operating under visual meteorological conditions (VMC) at night, he/she has:
 - (i) a valid instrument rating; or
 - (ii) 300 hours of flight time on helicopters, including 100 hours as pilot-in-command and 10 hours as pilot flying at night.

SECTION 3 – ADDITIONAL REQUIREMENTS FOR COMMERCIAL SPECIALISED OPERATIONS AND CAT OPERATIONS REFERRED TO IN ORO.FC.005(B)(1) AND (2)

ORO.FC.320 Operator conversion training and checking

Regulation (EU) 2021/2237

The operator conversion course shall include an operator proficiency check.

AMC1 ORO.FC.320 Operator conversion training and checking

ED Decision 2022/014/R

OPERATOR PROFICIENCY CHECK

The operator proficiency check should take place at the end of the operator conversion training programme defined in [AMC3 ORO.FC.120](#).

[applicable from 26 March 2023]

ORO.FC.325 Equipment and procedure training and checking

Regulation (EU) 2021/2237

If a flight crew member undergoes equipment and procedure training that requires training on a suitable FSTD or the aircraft, with regard to standard operating procedures related to a specialised operation, the flight crew member shall undergo an operator proficiency check.

AMC1 ORO.FC.325 Equipment and procedure training and checking

ED Decision 2022/014/R

SPECIALISED OPERATIONS

- (a) If the equipment and procedure training includes training for SOPs related to a specialised operation, points (b) to (f) of [AMC3 ORO.FC.120](#) should apply.
- (b) The operator proficiency check should take place at the end of the aircraft/FSTD training programme defined in [AMC3 ORO.FC.120](#).

[applicable from 26 March 2023]

ORO.FC.330 Recurrent training and checking — operator proficiency check

Regulation (EU) 2021/2237

- (a) Each flight crew member shall complete recurrent training and operator proficiency checks. In the case of specialised operations, the recurrent training and checking shall cover the relevant aspects associated with the specialised tasks described in the operations manual.
- (b) Appropriate consideration shall be given when operations are undertaken under IFR or at night.
- (c) The validity period of the operator proficiency check shall be 12 calendar months.

AMC1 ORO.FC.330 Recurrent training and checking — operator proficiency check

ED Decision 2022/014/R

SPO — RECURRENT TRAINING

- (a) The training should include:
- (1) ground training, including all the following:
 - (i) aircraft systems;
 - (ii) normal procedures, which include flight planning and ground-handling and flight operations, including performance, mass and balance, fuel schemes selection of alternates, and ground de-icing/anti-icing;
 - (iii) abnormal and emergency procedures, which include pilot incapacitation as applicable;
 - (iv) a review of relevant samples of accident/incident and occurrences to increase awareness of the occurrences that may be relevant for the intended operation;
 - (2) emergency and safety equipment training if one or more task specialists are on board. The training should ensure that all emergency equipment can be used timely and efficiently, that an emergency evacuation and first aid can be conducted, taking into account the training and operating procedures of the task specialist(s); and
 - (3) aircraft/FSTD training relevant to the type or variant of aircraft on which the flight crew operates.
- (b) Additional training relevant to the specialised tasks should be either ground training or aircraft/FSTD training or both, in accordance with the results of the operator's risk assessment.

SPO — OPERATOR PROFICIENCY CHECK

- (c) The SPO operator proficiency check should take place at least annually. If the SPO operator combines the operator proficiency check with a licence proficiency check, the check should cover both the normal, abnormal and emergency procedures relevant to the type or variant and the relevant aspects associated with the specialised tasks described in the operations manual.
- (d) If the SPO operator does not combine the operator proficiency check with a licence proficiency check, the operator proficiency check may not include the normal, abnormal and emergency procedures relevant to the type or variant that are already covered within the licence proficiency check. The operator proficiency check then covers the relevant aspects associated with the specialised task described in the operations manual.
- (e) The flight crew should be assessed on their CRM skills in accordance with the methodology described in [AMC1](#) and [AMC2 ORO.FC.115](#) and as specified in the operations manual. CRM assessment should not be used as a reason for a failure of the operator proficiency check unless the observed behaviour could lead to an unacceptable reduction in safety margin.
- (f) Each flight crew member should complete the operator proficiency checks as part of the normal crew complement.

SPO — RELEVANT PROCEDURES TO BE TRAINED AND CHECKED

- (g) The operator should determine, based on a risk assessment, which procedures associated with the specialised tasks are relevant to be trained and checked. The following should be taken into account:

- (1) specific risks associated with the specialised operation;
 - (2) for abnormal and emergency procedures, the criticality of the situation or failure and the impact of training and checking on ensuring a positive outcome; and
 - (3) for normal procedures, the amount of experience and recent experience accumulated since the previous training or checking.
- (h) The operator should establish a training and checking programme to ensure that normal, abnormal and emergency procedures covering the relevant aspects associated with the specialised tasks are:
- (1) trained and checked over a 2-year cycle for SPO operators engaged in only one specialised operation;
 - (2) trained and checked over a 2-year cycle for pilots engaged in only one specialised operation;
 - (3) trained and checked over a 3-year cycle, if neither (1) nor (2) applies;
 - (4) trained and checked before a pilot with no recent experience of the specialised operation in the last 6 months resumes the specialised operation.
- (i) Whenever an item requires both training and checking, the recurrent aircraft/FSTD training of a single task or manoeuvre should be separate from, and should not take place at the same time as, an operator proficiency check of the item.
 - (j) Specialised operations may be exposed to specific risks such as routinely flying within the height velocity envelope of a helicopter. The operator should avoid taking unnecessary risks during aircraft training and checking and should take advantage of simulation devices, if possible, to train for such situations.

COMBINED CAT AND SPO TRAINING AND CHECKING

- (k) If the operator is involved in both CAT and SPO, the CAT training and checking programme may include elements that are relevant to the specialised tasks. If this is the case, these training and checking elements may be credited towards compliance with [ORO.FC.330](#) as approved by the authority under [ORO.FC.145\(c\)](#).

[applicable from 26 March 2023]

GM1 ORO.FC.330 Recurrent training and checking — operator proficiency check

ED Decision 2022/014/R

SPO — RELEVANT PROCEDURES TO BE TRAINED AND CHECKED

The procedures to be trained in the aircraft/FSTD may be different from the procedures to be checked if both complement each other, as defined by the operator in [AMC1 ORO.FC.330](#), considering the following:

- (a) It may happen that several training elements are covered by a single check; and
- (b) Certain complex procedures are best explored under recurrent training, where the trainee will derive more benefit and training to proficiency is also employed.

[applicable from 26 March 2023]

SUBPART CC: CABIN CREW

ORO.CC.005 Scope

Regulation (EU) No 800/2013

This Subpart establishes the requirements to be met by the operator when operating an aircraft with cabin crew and comprises:

- (a) Section 1 specifying common requirements applicable to all operations; and
- (b) Section 2 specifying additional requirements only applicable to commercial air transport operations.

SECTION 1 – COMMON REQUIREMENTS

ORO.CC.100 Number and composition of cabin crew

Regulation (EU) 2019/1384

- (a) For the operation of aircraft with an MOPSC of more than 19, at least one cabin crew member shall be assigned when carrying one or more passenger(s).
- (b) For the purpose of complying with point (a), the minimum number of cabin crew members shall be the greatest number amongst the following:
 - (1) the number of cabin crew members established during the aircraft certification process in accordance with the applicable certification specifications, for the aircraft cabin configuration used by the operator;
 - (2) if the number under point (1) has not been established, the number of cabin crew members established during the aircraft certification process for the maximum certified passenger seating configuration reduced by 1 for every whole multiple of 50 passenger seats of the aircraft cabin configuration used by the operator falling below the maximum certified seating capacity;
 - (3) one cabin crew member for every 50, or fraction of 50, passenger seats installed on the same deck of the aircraft to be operated.
- (c) For operations with more than one cabin crew member, the operator shall nominate one cabin crew member accountable to the pilot-in-command or the commander.
- (d) By way of derogation from point (a), non-commercial operations with aircraft with an MOPSC of more than 19 may be performed without an operating cabin crew member, subject to the prior approval by the competent authority. To obtain the approval, the operator shall ensure that all of the following conditions are fulfilled:
 - (1) there are maximum 19 passengers on board;
 - (2) the operator has developed procedures for that operation.

AMC1 ORO.CC.100 Number and composition of cabin crew

ED Decision 2014/017/R

DETERMINATION OF THE NUMBER AND COMPOSITION OF CABIN CREW

- (a) When determining the minimum number of cabin crew required to operate aircraft engaged in CAT operations, factors to be taken into account should include:
- (1) the number of doors/exits;
 - (2) the type(s) of doors/exits and the associated assisting evacuation means;
 - (3) the location of doors/exits in relation to cabin crew stations and the cabin layout;
 - (4) the location of cabin crew stations taking into account direct view requirements and cabin crew duties in an emergency evacuation including:
 - (i) opening floor level doors/exits and initiating stair or slide deployment;
 - (ii) assisting passengers to pass through doors/exits; and
 - (iii) directing passengers away from inoperative doors/exits, crowd control and passenger flow management;
 - (5) actions required to be performed by cabin crew in ditching, including the deployment of slide-rafts and the launching of life-rafts;
 - (6) additional actions required to be performed by cabin crew members when responsible for a pair of doors/exits; and
 - (7) the type and duration of the flight to be operated.
- (b) When scheduling cabin crew for a flight, the operator should establish procedures that take account of the experience of each cabin crew member. The procedures should specify that the required cabin crew includes some cabin crew members who have at least 3 months experience as an operating cabin crew member.

GM1 ORO.CC.100 Number and composition of cabin crew

ED Decision 2019/019/R

MINIMUM NUMBER OF CABIN CREW

- (a) When determining the minimum required cabin crew for its specific aircraft cabin configuration, the operator should:
- (1) request information regarding the minimum number of cabin crew established by the aircraft type certificate (TC) holder or other design organisation responsible for showing compliance with the evacuation requirements of the applicable Certification Specifications; and
 - (2) take into account the factors specified in [AMC1 ORO.CC.100](#), as applicable.
- (b) The number of cabin crew referred to in [ORO.CC.100\(b\)\(1\)](#) means either:
- (1) the number of cabin crew who actively participated in the aircraft cabin during the relevant emergency evacuation demonstration, or who were assumed to have taken part in the relevant analysis, carried out by the aircraft TC holder when demonstrating the maximum passenger seating capacity (MPSC) of the aircraft type at the time of initial type certification; or

- (2) a lower number of cabin crew who actively participated in a subsequent emergency evacuation demonstration, or who were assumed to have taken part in the relevant analysis, and for which approval has been obtained for a cabin configuration other than the MPSC, either by the TC holder or by another design organisation. The operator should obtain a clear indication of that number which is specified in the related documentation.

AMC1 ORO.CC.100(d)(2) Number and composition of cabin crew

ED Decision 2019/019/R

PROCEDURES FOR NON-COMMERCIAL OPERATIONS WITH NO OPERATING CABIN CREW ON BOARD AN AIRCRAFT WITH AN MOPSC OF MORE THAN 19 AND MAXIMUM 19 PASSENGERS

The operator should assess the risk of operating a flight with no cabin crew member and ensure that the following procedures mitigate the risks and provide appropriate level of protection of the aircraft occupants:

- (a) Flight crew members assigned to these flights should receive training on operations where no cabin crew is required in accordance with [ORO.FC.220](#) and [ORO.FC.230](#).
- (b) The operator should consider the categories of passengers to be carried on such flights, who may be knowledgeable or not about the aircraft type and procedures in normal, abnormal and emergency situations.
- (c) The procedures should cover at least the following elements, if applicable:
 - (1) communication and coordination between flight crew members and passengers;
 - (2) flight crew member incapacitation;
 - (3) cabin surveillance;
 - (4) rapid egress from the aircraft in case of rapid disembarkation or evacuation;
 - (5) operation and use of emergency exits and assisting evacuation means;
 - (6) location and use of oxygen;
 - (7) location and use of life jackets;
 - (8) passenger seating in order to maintain:
 - (i) an easy access to emergency exits;
 - (ii) timely communication with flight crew member(s); and
 - (iii) the required mass and balance of the aircraft;
 - (9) passenger briefing in accordance with Annex IV (Part-CAT), including information on the location and use of equipment not displayed in the operator's safety briefing material, such as a fire extinguisher, first-aid equipment (e.g. first-aid kit, defibrillator), smoke hood, etc.; and
 - (10) any additional safety instructions that are deemed necessary to ensure passenger protection.

GM1 ORO.CC.100(d)(2) Number and composition of cabin crew

ED Decision 2019/019/R

CATEGORIES OF PASSENGERS

- (a) The operator should adapt the procedures for non-commercial operations with an aircraft with an MOPSC of more than 19 and maximum 19 passengers and no operating cabin crew on board to the categories of passengers to be carried on such flight. This includes but is not limited to the following groups:
- (1) Passengers who are already familiar with the aircraft environment, the procedures in normal operations, abnormal and emergency situations or trained on the aircraft type, e.g. non-operating aircrew members, maintenance personnel, etc.
 - (2) Passengers who are not familiar with the aircraft environment or procedures in normal operations, abnormal and emergency situations, e.g. operator's guests, employees, etc.
 - (3) Passengers who travel frequently on such flights. The operator may consider providing these passengers with training covering all safety and emergency procedures for the given aircraft type as described in [AMC1.1 CAT.OP.MPA.170](#). The operator should be able to show evidence of their training. These passengers may also be provided with an extended briefing to facilitate communication with flight crew and coordination of all passengers in case of an abnormal or emergency situation.
 - (4) Special categories of passengers (see [CAT.OP.MPA.155](#)).
- (b) The operator may include in its procedures a ratio of the categories of passengers described in (a) above that can travel on the same flight.

ORO.CC.110 Conditions for assignment to duties

Regulation (EU) No 965/2012

- (a) Cabin crew members shall only be assigned to duties on an aircraft if they:
- (1) are at least 18 years of age;
 - (2) have been assessed, in accordance with the applicable requirements of Annex IV (Part-MED) to Regulation (EU) No 1178/2011, as physically and mentally fit to perform their duties and discharge their responsibilities safely; and
 - (3) have successfully completed all applicable training and checking required by this Subpart and are competent to perform the assigned duties in accordance with the procedures specified in the operations manual.
- (b) Before assigning to duties cabin crew members who are working on a freelance or part-time basis, the operator shall verify that all applicable requirements of this Subpart are complied with, taking into account all services rendered by the cabin crew member to any other operator(s), to determine in particular:
- (1) the total number of aircraft types and variants operated; and
 - (2) the applicable flight and duty time limitations and rest requirements.
- (c) Operating cabin crew members, as well as their role with regard to the safety of passengers and flight, shall be clearly identified to the passengers.

ORO.CC.115 Conduct of training courses and associated checking

Regulation (EU) No 965/2012

- (a) A detailed programme and syllabus shall be established by the operator for each training course in accordance with the applicable requirements of this Subpart, and of Annex V (Part-CC) to Regulation (EU) No 1178/2011 where applicable, to cover the duties and responsibilities to be discharged by the cabin crew members.
- (b) Each training course shall include theoretical and practical instruction together with individual or collective practice, as relevant to each training subject, in order that the cabin crew member achieves and maintains the adequate level of proficiency in accordance with this Subpart.
- (c) Each training course shall be:
 - (1) conducted in a structured and realistic manner; and
 - (2) performed by personnel appropriately qualified for the subject to be covered.
- (d) During or following completion of all training required by this Subpart, each cabin crew member shall undergo a check covering all training elements of the relevant training programme, except for crew resource management (CRM) training. Checks shall be performed by personnel appropriately qualified to verify that the cabin crew member has achieved and/or maintains the required level of proficiency.
- (e) CRM training courses and CRM modules where applicable shall be conducted by a cabin crew CRM instructor. When CRM elements are integrated in other training, a cabin crew CRM instructor shall manage the definition and implementation of the syllabus.

GM1 ORO.CC.115 Conduct of training courses and associated checking

ED Decision 2014/017/R

EQUIPMENT AND PROCEDURES

The following definitions apply for the purpose of training programmes, syllabi and the conduct of training and checking on equipment and procedures:

- (a) 'Safety equipment' means equipment installed/carried to be used during day-to-day normal operations for the safe conduct of the flight and protection of occupants (e.g. seat belts, child restraint devices, safety card, safety demonstration kit).
- (b) 'Emergency equipment' means equipment installed/carried to be used in case of abnormal and emergency situations that demand immediate action for the safe conduct of the flight and protection of occupants, including life preservation (e.g. drop-out oxygen, crash axe, fire extinguisher, protective breathing equipment, manual release tool, slide-raft).
- (c) 'Normal procedures' means all procedures established by the operator in the operations manual for day-to-day normal operations (e.g. pre-flight briefing of cabin crew, pre-flight checks, passenger briefing, securing of galleys and cabin, cabin surveillance during flight).
- (d) 'Emergency procedures' means all procedures established by the operator in the operations manual for abnormal and emergency situations. For this purpose, 'abnormal' refers to a situation that is not typical or usual, deviates from normal operation and may result in an emergency.

AMC1 ORO.CC.115(c) Conduct of training courses and associated checking

ED Decision 2014/017/R

TRAINING METHODS AND TRAINING DEVICES

- (a) The operator should establish training methods that take into account the following:
- (1) training should include the use of cabin training devices, audio-visual presentations, computer-based training and other types of training, as most appropriate to the training element; and
 - (2) a reasonable balance between the different training methods should be ensured so that the cabin crew member achieves the level of proficiency necessary for a safe performance of all related cabin crew duties and responsibilities.
- (b) When assessing the representative training devices to be used, the operator should:
- (1) take into account that a representative training device may be used to train cabin crew as an alternative to the use of the actual aircraft or required equipment;
 - (2) ensure that those items relevant to the training and checking intended to be given accurately represent the aircraft or equipment in the following particulars:
 - (i) layout of the cabin in relation to doors/exits, galley areas and safety and emergency equipment stowage as relevant;
 - (ii) type and location of passenger seats and cabin crew stations;
 - (iii) doors/exits in all modes of operation, particularly in relation to the method of operation, mass and balance and operating forces, including failure of power-assist systems where fitted; and
 - (iv) safety and emergency equipment of the type provided in the aircraft (such equipment may be 'training use only' items and, for oxygen and protective breathing equipment, units charged with or without oxygen may be used); and
 - (3) assess the following factors when determining whether a door/exit can be considered to be a variant of another type:
 - (i) door/exit arming/disarming;
 - (ii) direction of movement of the operating handle;
 - (iii) direction of door/exit opening;
 - (iv) power-assist mechanisms; and
 - (v) assisting evacuation means such as slides and ropes.

AMC1 ORO.CC.115(d) Conduct of training courses and associated checking

ED Decision 2014/017/R

CHECKING

- (a) Checking required for each training course should be accomplished by the method appropriate to the training element to be checked. These methods include:
- (1) practical demonstration;

- (2) computer-based assessment;
 - (3) in-flight checks;
 - (4) oral or written tests.
- (b) Training elements that require individual practical participation may be combined with practical checks.

AMC1 ORO.CC.115(e) Conduct of training courses and associated checking

ED Decision 2015/022/R

RESOURCE MANAGEMENT (CRM) TRAINING – MULTI CABIN CREW OPERATIONS

- (a) General
 - (1) Training environment

CRM training should be conducted in the non-operational environment (classroom and computer-based) and in the operational environment (cabin training device and aircraft). Tools such as group discussions, team task analysis, team task simulation and feedback should be used.
 - (2) Classroom training

Whenever possible, classroom training should be conducted in a group session away from the pressures of the usual working environment, so that the opportunity is provided for cabin crew members to interact and communicate in an environment conducive to learning.
 - (3) Computer-based training

Computer-based training should not be conducted as a stand-alone training method, but may be conducted as a complementary training method.
 - (4) Cabin training devices and aircraft

Whenever practicable, relevant parts of CRM training should be conducted in representative cabin training devices that reproduce a realistic operational environment, or in the aircraft. During practical training, interaction should be encouraged.
 - (5) Integration into cabin crew training

CRM principles should be integrated into relevant parts of cabin crew training and operations, including checklists, briefings and emergency procedures.
 - (6) Combined CRM training for flight crew and cabin crew
 - (i) Operators should provide combined training for flight crew and cabin crew during recurrent CRM training.
 - (ii) The combined training should address at least:
 - (A) effective communication, coordination of tasks and functions of flight crew and cabin crew; and
 - (B) mixed multinational and cross-cultural flight crew and cabin crew, and their interaction, if applicable.

- (iii) Combined CRM training should be conducted by flight crew CRM trainer or cabin crew CRM trainer.
 - (iv) There should be an effective liaison between flight crew and cabin crew training departments. Provision should be made for transfer of relevant knowledge and skills between flight crew and cabin crew CRM trainers.
- (7) Management system

CRM training should address hazards and risks identified by the operator's management system described in [ORO.GEN.200](#).
- (8) Competency-based CRM training

Whenever practicable, the compliance-based approach concerning CRM training may be substituted by a competency-based approach. In this context, CRM training should be characterised by a performance orientation, with emphasis on standards of performance and their measurement, and the development of training to the specified performance standards.
- (9) Contracted CRM training

If the operator chooses not to establish its own CRM training, another operator, a third party or a training organisation may be contracted to provide the training in accordance with [ORO.GEN.205](#). In case of contracted CRM training, the operator should ensure that the content of the course covers the specific culture, the type of operations and the associated procedures of the operator. When crew members from different operators attend the same course, the CRM training should be specific to the relevant flight operations and to the trainees concerned.
- (b) Operator's CRM training

The operator's CRM training should cover all elements listed in Table 1 of (g). Several training elements are specified as 'not required' for the operator's CRM training, since they are covered under the introductory CRM course for cabin crew as required in Annex V (Part-CC) to Commission Regulation (EU) No 1178/2011.
- (c) Operator aircraft type conversion CRM training

If the cabin crew member undertakes the operator's conversion training on an aircraft type, the applicable CRM training elements should be covered as specified in Table 1 of (g).
- (d) Annual recurrent CRM training
 - (1) Annual recurrent CRM training should be provided in such a way that all CRM training elements specified for the annual recurrent training in Table 1 of (g) are covered over a period not exceeding 3 years.
 - (2) Operators should update their recurrent CRM training programme over a period not exceeding 3 years. The revision of the programme should take into account information from the operator's management system.
- (e) Senior cabin crew member course
 - (1) CRM training for senior cabin crew members should be the application of knowledge gained in previous CRM training and operational experience relevant to the specific duties and responsibilities of a senior cabin crew member. The operator should ensure that for the senior cabin crew member course the CRM training elements are integrated into the training, as specified in Table 1 of (g).

- (2) During the training the senior cabin crew member should demonstrate the ability:
 - (i) to manage the operation; and
 - (ii) to take appropriate leadership and management decisions.
- (f) Training elements

The CRM training elements to be covered are specified in Table 1 of (g). The operator should ensure that the following aspects are addressed:

(1) Resilience development

CRM training should address the main aspects of resilience development. The training should cover:

(i) Mental flexibility

Cabin crew should be trained to:

- (A) understand that mental flexibility is necessary to recognise critical changes;
- (B) reflect on their judgement and adjust it to the unique situation;
- (C) avoid fixed prejudices and over-reliance on standard solutions; and
- (D) remain open to changing assumptions and perceptions.

(ii) Performance adaptation

Cabin crew should be trained to:

- (A) mitigate frozen behaviours, overreactions and inappropriate hesitation; and
- (B) adjust actions to current conditions.

(2) Surprise and startle effect

CRM training should address unexpected, unusual and stressful situations including interruptions and distractions. Therefore, CRM training should be designed to prepare cabin crew to master sudden events and associated uncontrolled reactions.

(3) Cultural differences

CRM training should cover cultural differences of multinational and cross-cultural crews. This includes recognising that:

- (i) different cultures may have different communication specifics, ways of understanding and approaches to the same situation or problem;
- (ii) difficulties may arise when crew members with different mother tongue communicate in a common language which is not their mother tongue; and
- (iii) cultural differences may lead to different methods for identifying a situation and solving a problem.

(4) Operator's safety culture and company culture

CRM training should cover the operator's safety culture, its company culture, the type of operations and the associated procedures of the operator. This should include areas of operations that may lead to particular difficulties or involve unusual hazards.

(5) Case studies

(i) CRM training should cover aircraft type-specific case studies, based on the information available within the operator's management system, including:

(A) accident and serious incident reviews to analyse and identify any associated non-technical causal and contributory factors, and instances or examples of lack of CRM; and

(B) analysis of occurrences that were well managed.

(ii) If relevant aircraft type-specific or operator-specific case studies are not available, the operator should consider other case studies relevant to the scale and scope of its operations.

(g) CRM training syllabus

Table 1 below specifies which CRM training elements should be covered in each type of training. The levels of training in Table 1 can be described as follows:

(1) 'Required' means training that should be instructional or interactive in style to meet the objectives specified in the CRM training programme or to refresh and strengthen knowledge gained in a previous training.

(2) 'In-depth' means training that should be instructive or interactive in style taking full advantage of group discussions, team task analysis, team task simulation, etc., for the acquisition or consolidation of knowledge, skills and attitudes. The CRM training elements should be tailored to the specific needs of the training phase being undertaken.

Table 1 — Cabin crew CRM training

CRM training elements	Operator's CRM training	Operator aircraft type conversion training	Annual recurrent training	Senior cabin crew member (SCC) course
General principles				
Human factors in aviation; General instructions on CRM principles and objectives; Human performance and limitations; Threat and error management.	Not required (covered under initial training required by Part-CC)	Required	Required	Required
Relevant to the individual cabin crew member				
Personality awareness, human error and reliability, attitudes and behaviours, self-assessment and self-critique; Stress and stress management; Fatigue and vigilance; Assertiveness, situation awareness, information acquisition and processing.	Not required (covered under initial training required by Part-CC)	Required	Required (3-year cycle)	Required
Relevant to the entire aircraft crew				
Shared situation awareness, shared information acquisition and processing; Workload management; Effective communication and coordination between all crew members including the flight crew as well as inexperienced cabin crew members;	In-depth	Required when relevant to the type(s)	Required (3-year cycle)	In-depth

Leadership, cooperation, synergy, delegation, decision-making, actions; Resilience development; Surprise and startle effect; Cultural differences; Identification and management of the passenger human factors: crowd control, passenger stress, conflict management, medical factors.				
Specifics related to aircraft types (narrow-/wide-bodied, single-/multi-deck), flight crew and cabin crew composition and number of passengers	Required	In-depth	Required (3-year cycle)	In-depth
Relevant to the operator and the organisation				
Operator's safety culture and company culture, standard operating procedures (SOPs), organisational factors, factors linked to the type of operations; Effective communication and coordination with other operational personnel and ground services; Participation in cabin safety incident and accident reporting.	In-depth	Required when relevant to the type(s)	Required (3-year cycle)	In-depth
Case- studies	In-depth	Required when relevant to the type(s)	In-depth	In-depth

[Table 1 applicable until 25 March 2023 — ED Decision 2022/014/R]

AMC2 ORO.CC.115(e) Conduct of training courses and associated checking

ED Decision 2022/014/R

CREW RESOURCE MANAGEMENT (CRM) TRAINING — SINGLE CABIN CREW OPERATIONS

For single cabin crew operations, [AMC1 ORO.CC.115\(e\)](#) should be applied with the following differences:

(a) Relevant training elements

CRM training should focus on the elements specified in Table 1 of (g) of [AMC1 ORO.CC.115\(e\)](#) which are relevant to single cabin crew operations. Therefore, single cabin crew CRM training should include, among others:

- (1) situation awareness;
- (2) workload management;
- (3) decision-making;
- (4) resilience development;
- (5) surprise and startle effect; and

- (6) effective communication and coordination with
 - (i) the flight crew; and
 - (ii) other operational personnel and ground services.
- (b) Virtual classroom training

Notwithstanding (a)(2) of [AMC1 ORO.CC.115\(e\)](#), classroom training may take place remotely, using a videoconferencing tool for a cabin crew member operating on aircraft with a maximum operational passenger seating configuration of 19 or less. The tool should permit real-time interaction between the trainees and the trainer, including speech and elements of body language. It should also be capable of transmitting any document to the trainee that the trainer wishes to present. The CRM trainer should establish the list of trainees in advance. Their number should be limited to 6 to ensure a sufficient level of interaction during the training session.

AMC3 ORO.CC.115(e) Conduct of training courses and associated checking

ED Decision 2015/022/R

CABIN CREW CRM TRAINER

(a) Applicability

The provisions described herein:

- (1) should be fulfilled by cabin crew CRM trainers responsible for classroom CRM training; and
- (2) are not applicable to trainers or instructors conducting training other than CRM training, but integrating CRM elements into this training. Nevertheless, trainers or instructors who are integrating CRM elements into the aircraft type training, recurrent training or senior cabin crew member training should have acquired relevant knowledge of human performance and limitations, and have completed appropriate CRM training.

(b) Qualification of cabin crew CRM trainer

- (1) A training and standardisation programme for cabin crew CRM trainers should be established.
- (2) The cabin crew CRM trainer, in order to be suitably qualified, should:
 - (i) have adequate knowledge of the relevant flight operations;
 - (ii) have received instructions on human performance and limitations (HPL);
 - (iii) have completed an introductory CRM course, as required in Annex V (Part-CC) to Commission Regulation (EU) No 1178/2011, and an operator's CRM training, as specified in [AMC1 ORO.CC.115\(e\)](#);
 - (iv) have received training in group facilitation skills;
 - (v) have received additional training in the fields of group management, group dynamics and personal awareness; and
 - (vi) have demonstrated the knowledge, skills and credibility required to train the CRM training elements in the non-operational environment, as specified in Table 1 of [AMC1 ORO.CC.115\(e\)](#).

-
- (3) An experienced CRM trainer may become a cabin crew CRM trainer if he/she demonstrates a satisfactory knowledge of the relevant flight operations and the cabin crew working environment, and fulfils the provisions specified in (2)(ii) to (2)(vi).
- (c) Training of cabin crew CRM trainer
- (1) Training of cabin crew CRM trainers should be both theoretical and practical. Practical elements should include the development of specific trainer skills, particularly the integration of CRM into day-to-day operations.
- (2) The basic training of cabin crew CRM trainers should include the training elements for cabin crew, as specified in Table 1 of [AMC1 ORO.CC.115\(e\)](#). In addition, the basic training should include the following:
- (i) introduction to CRM training;
 - (ii) operator's management system; and
 - (iii) characteristics, as applicable:
 - (A) of the different types of CRM trainings (initial, recurrent, etc.);
 - (B) of combined training; and
 - (C) related to the type of aircraft or operation.
- (3) The refresher training of cabin crew CRM trainers should include new methodologies, procedures and lessons learned.
- (4) The training of cabin crew CRM trainers should be conducted by cabin crew CRM trainers with a minimum of 3 years' experience. Assistance may be provided by experts in order to address specific areas.
- (d) Assessment of cabin crew CRM trainer
- (1) A cabin crew CRM trainer should be assessed by the operator when conducting the first CRM training course. This first assessment should be valid for a period of 3 years.
- (2) Assessment is the process of observing, recording, interpreting and debriefing the cabin crew CRM trainer. The operator should describe the assessment process in the operations manual. All personnel involved in the assessment must be credible and competent in their role.
- (e) Recency and renewal of qualification as cabin crew CRM trainer
- (1) For recency of the 3-year validity period, the cabin crew CRM trainer should:
- (i) conduct at least 2 CRM training events in any 12-month period;
 - (ii) be assessed within the last 12 months of the 3-year validity period by the operator; and
 - (iii) complete CRM trainer refresher training within the 3-year validity period.
- (2) The next 3-year validity period should start at the end of the previous period.
- (3) For renewal, i.e. when a cabin crew CRM trainer does not fulfil the provisions of (1), he/she should, before resuming as cabin crew CRM trainer:
- (i) comply with the qualification provisions of (b) and (d); and
 - (ii) complete CRM trainer refresher training.

GM1 ORO.CC.115(e) Conduct of training courses and associated checking

ED Decision 2015/022/R

CRM – GENERAL

- (a) CRM is the effective utilisation of all available resources (e.g. crew members, aircraft systems, and supporting facilities) to achieve safe and efficient operation.
- (b) The objective of CRM is to enhance the communication and management skills of the crew member, as well as the importance of effective coordination and two-way communication between all crew members.

GM2 ORO.CC.115(e) Conduct of training courses and associated checking

ED Decision 2022/014/R

MINIMUM TRAINING TIMES

- (a) The following minimum training times are appropriate:
 - (1) multi cabin crew operations:
 - (i) combined CRM training: 6 training hours over a period of 3 years or, for EBT operators which have implemented a competency framework for cabin crew (e.g. ICAO PANS-TRG), a minimum of 3 training hours within 3 years; and
 - (ii) operator's CRM training: 6 training hours;
 - (2) operator's CRM training for single cabin crew operations: 4 training hours for a cabin crew member operating on aircraft with a maximum operational passenger seating configuration of 19 or less;
 - (3) cabin crew CRM trainer:
 - (i) basic training:
 - (A) 18 training hours when the operator can justify that the trainee already has received sufficient and suitable instruction on training skills in order to conduct CRM training courses; or
 - (B) 30 training hours for trainees not fulfilling (A); and
 - (ii) refresher training: 6 training hours.
- (b) 'Training hours' means actual training time excluding breaks.

GM3 ORO.CC.115(e) Conduct of training courses and associated checking

ED Decision 2022/014/R

DESIGN, IMPLEMENTATION AND EVALUATION OF CRM TRAINING

The checklist in Table 1 provides guidance on the design, implementation and evaluation of CRM training, and on their incorporation into the operator's safety culture. Elements of the operator's management systems and the competency-based approach are incorporated in the checklist.

Table 1 — Checklist for design, implementation, evaluation and incorporation of CRM training

Step No	Description	Element
1	Needs analysis	Determine the necessary CRM competencies
		Develop CRM training goals
		Ensure the organisation is ready for CRM training
2	Design	Develop CRM training objectives
		Determine what to measure and how to measure it
3	Development	Describe the CRM learning environment
		Develop full-scale prototype of training
		Validate and modify CRM training
4	Implementation	Prepare trainees and environment
		Set a climate for learning (e.g. practice and feedback)
		Implement the CRM training programme
5	Evaluation	Determine training effectiveness
		Evaluate CRM training at multiple levels
		Revise the CRM training programme to improve effectiveness
6	Incorporation	Establish an environment where CRM training is positively recognised
		Reinforce CRM behaviours in daily work
		Provide recurrent CRM training

GM4 ORO.CC.115(e) Conduct of training courses and associated checking

ED Decision 2022/014/R

RESILIENCE DEVELOPMENT

- (a) The main aspects of resilience development can be described as the ability to:
- (1) learn ('knowing what has happened');
 - (2) monitor ('knowing what to look for');
 - (3) anticipate ('finding out and knowing what to expect'); and
 - (4) respond ('knowing what to do and being capable of doing it').
- (b) Operational safety is a continuous process of evaluation of and adjustment to existing and future conditions. In this context, and following the description in (a), resilience development involves an ongoing and adaptable process including situation assessment, self-review, decision and action. Training on resilience development enables crew members to draw the right conclusions from both positive and negative experiences. Based on those experiences, crew members are better prepared to maintain or create safety margins by adapting to dynamic complex situations.
- (c) The training topics in (f)(1) of [AMC1 ORO.CC.115\(e\)](#) are to be understood as follows:
- (1) Mental flexibility
 - (i) The phrase 'understand that mental flexibility is necessary to recognise critical changes' means that crew members are prepared to respond to situations for which there is no set procedure.

- (ii) The phrase ‘reflect on their judgement and adjust it to the unique situation’ means that crew members learn to review their judgement based on the unique characteristics of the given circumstances.
 - (iii) The phrase ‘avoid fixed prejudices and over-reliance on standard solutions’ means that crew members learn to update solutions and standard response sets, which have been formed on prior knowledge.
 - (iv) The phrase ‘remain open to changing assumptions and perceptions’ means that crew members constantly monitor the situation, and are prepared to adjust their understanding of the evolving conditions.
- (2) Performance adaptation
- (i) The phrase ‘mitigate frozen behaviours, overreactions and inappropriate hesitation’ means that crew members correct improper actions with a balanced response.
 - (ii) The phrase ‘adjust actions to current conditions’ means that crew members’ responses are in accordance with the actual situation.

GM5 ORO.CC.115(e) Conduct of training courses and associated checking

ED Decision 2015/022/R

CABIN CREW CRM TRAINER ASSESSMENT

- (a) For assessing cabin crew CRM trainers, the operator may nominate experienced cabin crew CRM trainers who have demonstrated continued compliance with the provisions for a cabin crew CRM trainer and capability in that role for at least 3 years.
- (b) An operator that does not have the resources to conduct the assessment may employ a contractor. The standard as regards the assessment is confirmed on a 3-year basis by the operator.
- (c) The checklist in Table 1 provides guidance on the assessment of a cabin crew CRM trainer. If a cabin crew CRM trainer is competent in his/her role, the response to the questions in Table 1 should be ‘yes’. When answering the questions in Table 1, justifications and examples related to the responses given should be provided.

Table 1 — Cabin crew CRM trainer assessment checklist

Questions to assess a cabin crew CRM trainer	Response yes/no
Did the CRM trainer demonstrate the knowledge required for the role?	
Did the CRM trainer support CRM concepts?	
Did the CRM trainer encourage trainees to participate, share their experiences and self-analyse?	
Did the CRM trainer identify and respond to the trainees’ needs relative to expertise/experience?	
Did the CRM trainer show how CRM is integrated in technical training?	
Did the CRM trainer incorporate company CRM standards when appropriate?	
Did the CRM trainer identify and discuss the non-technical reasons involved in accidents, incidents and events included in case studies?	
Did the CRM trainer regularly check for understanding and resolve ambiguities?	
Did the CRM trainer demonstrate effective instruction and facilitation skills?	

GM6 ORO.CC.115(e) Conduct of training courses and associated checking

ED Decision 2022/014/R

CRM TRAINING — VIRTUAL CLASSROOM TRAINING — SINGLE-CABIN CREW OPERATIONS OF AIRCRAFT WITH AN MOPSC OF 19 OR LESS

- (a) A successful virtual classroom training relies on the ability of the trainer to make best use of the associated technologies in the context of CRM training. The cabin crew CRM trainer may need to receive appropriate training covering the following:
 - (1) learning style;
 - (2) teaching method associated with virtual classroom instruction, such as videoconferencing, and a familiarisation with the virtual classroom instruction system in use, including management of time, training media and equipment and tools.
- (b) The requirement of [ORO.GEN.140](#) for the operator to grant access to the competent authority also applies to the virtual classroom training.
- (c) More information on virtual classroom training is provided in the EASA Guidance for allowing virtual classroom instruction and distance learning.

ORO.CC.120 Initial training course

Regulation (EU) No 965/2012

- (a) Each new entrant who does not already hold a valid cabin crew attestation issued in accordance with Annex V (Part-CC) to Regulation (EU) No 1178/2011:
 - (1) shall be provided with an initial training course as specified in CC.TRA.220 of that Annex; and
 - (2) shall successfully undergo the associated examination before undertaking other training required by this Subpart.
- (b) Elements of the initial training programme may be combined with the first aircraft type specific training and operator conversion training, provided that the requirements of CC.TRA.220 are met and any such element(s) are recorded as elements of the initial training course in the training records of the cabin crew members concerned.

AMC1 ORO.CC.120(a)(1) Initial training course

ED Decision 2014/017/R

NEW ENTRANTS IN OPERATIONS OTHER THAN CAT OPERATIONS

- (a) When a new entrant to an operator conducting operations other than CAT is a cabin crew member, not holding a valid cabin crew attestation, who has already acquired experience as cabin crew in operations other than CAT, credit may be granted to the elements of the initial training programme he/she has previously completed if such training elements are documented in his/her training records.
- (b) In such a case, the operator should ensure that:
 - (1) the full training programme, as specified in Appendix 1 to Part-CC, has been covered, and
 - (2) the new entrant successfully undergoes the examination required by [ORO.CC.120\(a\)\(2\)](#).

ORO.CC.125 Aircraft type specific training and operator conversion training

Regulation (EU) No 71/2014

- (a) Each cabin crew member shall have completed appropriate aircraft type specific training and operator conversion training, as well as the associated checks, before being:
 - (1) first assigned by the operator to operate as a cabin crew member; or
 - (2) assigned by that operator to operate on another aircraft type.
- (b) When establishing the aircraft type specific and the operator conversion training programmes and syllabi, the operator shall include, where available, the relevant elements defined in the mandatory part of the operational suitability data established in accordance with Regulation (EU) No 748/2012.
- (c) The aircraft type specific training programme shall:
 - (1) involve training and practice on a representative training device or on the actual aircraft; and
 - (2) cover at least the following aircraft type specific training elements:
 - (i) aircraft description as relevant to cabin crew duties;
 - (ii) all safety equipment and systems installed relevant to cabin crew duties;
 - (iii) operation and actual opening, by each cabin crew member, of each type or variant of normal and emergency doors and exits in the normal and emergency modes;
 - (iv) demonstration of the operation of the other exits including flight crew compartment windows;
 - (v) fire and smoke protection equipment where installed;
 - (vi) evacuation slide training, where fitted;
 - (vii) operation of the seat, restraint system and oxygen system equipment relevant to pilot incapacitation.
- (d) The operator conversion training programme for each aircraft type to be operated shall:
 - (1) involve training and practice on a representative training device or on the actual aircraft;
 - (2) include training in the operator's standard operating procedures for cabin crew members to be first assigned to duties by the operator;
 - (3) cover at least the following operator specific training elements as relevant to the aircraft type to be operated:
 - (i) description of the cabin configuration;
 - (ii) location, removal and use of all portable safety and emergency equipment carried on-board;
 - (iii) all normal and emergency procedures;
 - (iv) passenger handling and crowd control;
 - (v) fire and smoke training including the use of all related fire-fighting and protective equipment representative of that carried on-board;
 - (vi) evacuation procedures;

- (vii) pilot incapacitation procedures;
- (viii) applicable security requirements and procedures;
- (ix) crew resource management.

AMC1 ORO.CC.125(c) Aircraft type specific training and operator conversion training

ED Decision 2014/017/R

TRAINING PROGRAMME — AIRCRAFT TYPE SPECIFIC TRAINING

The following aircraft type specific training elements should be covered as relevant to the aircraft type:

- (a) Aircraft description
 - (1) type of aircraft, principal dimensions, narrow or wide bodied, single or double deck;
 - (2) speed, altitude, range;
 - (3) passenger seating capacity;
 - (4) flight crew number and minimum number of required cabin crew;
 - (5) cabin doors/exits location and sill height;
 - (6) cargo and unpressurised areas as relevant;
 - (7) aircraft systems relevant to cabin crew duties;
 - (8) flight crew compartment — general presentation, pilot seats and their mechanism, emergency exits, storage;
 - (9) required cabin crew stations;
 - (10) flight crew compartment security — general: door components and use;
 - (11) access to avionics bay where relevant;
 - (12) lavatories — general: doors, systems, calls and signs; and
 - (13) least risk bomb location.
- (b) Safety and emergency equipment and aircraft systems installed

Each cabin crew member should receive realistic training on, and demonstration of, the location and use of all aircraft type specific safety and emergency equipment and aircraft systems installed, with emphasis on the following:

 - (1) slides, and where non-self-supporting slides are carried, the use of any associated assisting evacuation means;
 - (2) life-rafts and slide-rafts, including the equipment attached to, and/or carried in, the raft;
 - (3) drop-out oxygen system; and
 - (4) communication equipment.
- (c) Operation of doors and exits

This training should be conducted in a representative training device or in the actual aircraft and should include failure of power assist systems where fitted and the action and forces

required to operate and deploy evacuation slides. Training should also include operation and actual opening of the flight crew compartment security door when installed.

(d) Fire and smoke protection equipment

Each cabin crew member should be trained in using fire and/or smoke protection equipment where fitted.

(e) Evacuation slide training

(1) Each cabin crew member should descend an evacuation slide from a height representative of the aircraft main deck sill height.

(2) The slide should be fitted to a representative training device or to the actual aircraft.

(3) A further descent should be made when the cabin crew member qualifies on an aircraft type in which the main deck exit sill height differs significantly from any aircraft type previously operated.

(f) Operation of equipment related to pilot incapacitation

The training should cover any type specific elements or conditions relevant to cabin crew actions to be taken in case of pilot incapacitation. Each cabin crew member should be trained to operate all equipment that must be used in case of pilot incapacitation.

AMC1 ORO.CC.125(d) Aircraft type-specific training and operator conversion training

ED Decision 2019/019/R

TRAINING PROGRAMME — OPERATOR CONVERSION TRAINING

The following training elements should be covered as relevant to the aircraft type and the related operator's specifics:

(a) Description of the cabin configuration

The description should cover all elements specific to the operator's cabin configuration and any differences with those previously covered in accordance with [AMC1 ORO.CC.125\(c\)](#), including:

- (1) required and additional cabin crew stations — location (including direct view), restraint systems, control panels;
- (2) passenger seats — general presentation and associated operator's specific features and equipment;
- (3) designated stowage areas;
- (4) lavatories — operator's specific features, equipment and systems additional to the aircraft type specific elements;
- (5) galley — location, appliances, water and waste system, including shut-off, sinks, drains, stowage, control panels, calls and signs;
and where applicable
- (6) crew rest areas — location, systems, controls, safety and emergency equipment;
- (7) cabin dividers, curtains, partitions;
- (8) lift location, use, controls;

- (9) stowage for the containment of waste;
- (10) passenger hand rail system or alternative means; and
- (11) in-flight entertainment (IFE) system, if installed (e.g. central system or hand-held device(s) such as PEDs for the use by passenger(s) as applicable) and its safety aspects.

(b) Safety and emergency equipment

Each cabin crew member should receive realistic training on and demonstration of the location and use of all safety and emergency equipment carried, including:

- (1) life jackets, infant life jackets and flotation devices;
- (2) first-aid and drop-out oxygen, including supplementary systems;
- (3) fire extinguishers and protective breathing equipment (PBE);
- (4) crash axe or crowbar;
- (5) emergency lights including torches;
- (6) communication equipment, including megaphones;
- (7) slide rafts and life rafts' survival packs and their contents;
- (8) pyrotechnics (actual or representative devices);
- (9) first-aid kits, emergency medical kits and their contents; and
- (10) other portable safety and emergency equipment, where applicable.

(c) Normal and emergency procedures

Each cabin crew member should be trained on the operator's normal and emergency procedures as applicable, with emphasis on the following:

- (1) passenger briefing, safety demonstration and cabin surveillance;
- (2) severe air turbulence;
- (3) non-pressurisation, slow and sudden decompression, including the donning of portable oxygen equipment by each cabin crew member;
- (4) other in-flight emergencies; and
- (5) carriage of special categories of passengers (SCPs).

(d) Passenger handling and crowd control

Training should be provided on the practical aspects of passenger preparation and handling, as well as crowd control, in various emergency situations as applicable to the operator's specific aircraft cabin configuration, and should cover the following:

- (1) communications between flight crew and cabin crew and use of all communications equipment, including the difficulties of coordination in a smoke-filled environment;
- (2) verbal commands;
- (3) the physical contact that may be needed to encourage people out of a door/exit and onto a slide;
- (4) redirection of passengers away from unusable doors/exits;
- (5) marshalling of passengers away from the aircraft;

- (6) evacuation of special categories of passengers with emphasis on passengers with disabilities or reduced mobility; and
- (7) authority and leadership.
- (e) Fire and smoke training
 - (1) Each cabin crew member should receive realistic and practical training in the use of all fire-fighting equipment, including protective clothing representative of that carried in the aircraft.
 - (2) Each cabin crew member should:
 - (i) extinguish an actual fire characteristic of an aircraft interior fire except that, in the case of halon extinguishers, an alternative extinguishing agent may be used; and
 - (ii) exercise the donning and use of PBE in an enclosed simulated smoke-filled environment with particular emphasis on identifying the actual source of fire and smoke.
- (f) Evacuation procedures

Training should include all the operator's procedures that are applicable to planned or unplanned evacuations on land and water. It should also include, where relevant, the additional actions required from cabin crew members responsible for a pair of doors/exits and the recognition of when doors/exits are unusable or when evacuation equipment is unserviceable.
- (g) Pilot incapacitation procedures

Unless the minimum flight crew is more than two, each cabin crew member should be trained in the procedure for pilot incapacitation. Training in the use of flight crew checklists, where required by the operator's standard operating procedures (SOPs), should be conducted by a practical demonstration.
- (h) CRM
 - (1) The operator should ensure that all applicable CRM training elements, as specified in Table 1 of [AMC1 ORO.CC.115\(e\)](#), are covered to the level required in the column 'Operator aircraft type conversion training'.
 - (2) The operator's CRM training and the CRM training covered during the operator aircraft type conversion training should be conducted by at least one cabin crew CRM instructor.

AMC1 ORO.CC.125 & ORO.CC.130 Aircraft type specific training and operator conversion training & differences training

ED Decision 2014/017/R

TRAINING PROGRAMMES

The programmes and syllabi of aircraft type specific training, operator conversion training and differences training should take into account the cabin crew member's previous training as documented in his/her training records.

AMC1 ORO.CC.125(b) & ORO.CC.130(c) Aircraft type specific training and operator conversion training & differences training

ED Decision 2014/017/R

NON-MANDATORY (RECOMMENDATIONS) ELEMENTS OF OPERATIONAL SUITABILITY DATA

When developing the training programmes and syllabi for aircraft-type specific training and for differences training, the operator should consider the non-mandatory (recommendations) elements for the relevant type that are provided in the operational suitability data established in accordance with Commission Regulation (EU) No 748/2012¹.

ORO.CC.130 Differences training

Regulation (EU) No 71/2014

- (a) In addition to the training required in [ORO.CC.125](#), the cabin crew member shall complete appropriate training and checking covering any differences before being assigned on:
 - (1) a variant of an aircraft type currently operated; or
 - (2) a currently operated aircraft type or variant with different:
 - (i) safety equipment;
 - (ii) safety and emergency equipment location; or
 - (iii) normal and emergency procedures.
- (b) The differences training programme shall:
 - (1) be determined as necessary on the basis of a comparison with the training programme completed by the cabin crew member, in accordance with [ORO.CC.125\(c\)](#) and (d), for the relevant aircraft type; and
 - (2) involve training and practice in a representative training device or the actual aircraft as relevant to the difference training element to be covered.
- (c) When establishing a differences training programme and syllabus for a variant of an aircraft type currently operated, the operator shall include, where available, the relevant elements defined in the mandatory part of the operational suitability data established in accordance with Regulation (EU) No 748/2012.

AMC1 ORO.CC.125 & ORO.CC.130 Aircraft type specific training and operator conversion training & differences training

ED Decision 2014/017/R

TRAINING PROGRAMMES

The programmes and syllabi of aircraft type specific training, operator conversion training and differences training should take into account the cabin crew member's previous training as documented in his/her training records.

¹ OJ L 243, 27.9.2003, p. 6.

AMC1 ORO.CC.125(b) & ORO.CC.130(c) Aircraft type specific training and operator conversion training & differences training

ED Decision 2014/017/R

NON-MANDATORY (RECOMMENDATIONS) ELEMENTS OF OPERATIONAL SUITABILITY DATA

When developing the training programmes and syllabi for aircraft-type specific training and for differences training, the operator should consider the non-mandatory (recommendations) elements for the relevant type that are provided in the operational suitability data established in accordance with Commission Regulation (EU) No 748/2012¹.

ORO.CC.135 Familiarisation

Regulation (EU) No 965/2012

After completion of aircraft type specific training and operator conversion training on an aircraft type, each cabin crew member shall complete appropriate supervised familiarisation on the type before being assigned to operate as a member of the minimum number of cabin crew required in accordance with [ORO.CC.100](#).

AMC1 ORO.CC.135 Familiarisation

ED Decision 2019/019/R

FAMILIARISATION FLIGHTS AND AIRCRAFT FAMILIARISATION VISITS

- (a) For CAT operations, familiarisation of cabin crew to a new aircraft type or variant should be completed in accordance with the following, as relevant:
 - (1) New entrant cabin crew

Each new entrant cabin crew member having no previous comparable operating experience should participate in:

 - (i) a familiarisation visit, as described in (c), to the aircraft to be operated; and
 - (ii) familiarisation flights, as described in (b).
 - (2) Cabin crew operating on a subsequent aircraft type

A cabin crew member assigned to operate on a subsequent aircraft type with the same operator should participate either in:

 - (i) a familiarisation flight, as described in (b); or
 - (ii) a familiarisation visit, as described in (c), to the aircraft type to be operated.
- (b) Familiarisation flights
 - (1) During familiarisation flights, the cabin crew member should be assigned in addition to the minimum number of cabin crew required in accordance with [ORO.CC.100](#) and if applicable [ORO.CC.200](#).
 - (2) Familiarisation flights should be:
 - (i) conducted under the supervision of the senior cabin crew member;

¹ OJ L 243, 27.9.2003, p. 6.

- (ii) structured and conducted with the cabin crew member participating in pre-flight, in-flight and post-flight safety duties;
 - (iii) operated with the cabin crew member wearing the operator's cabin crew uniform; and
 - (iv) recorded in the training record of the cabin crew member.
- (c) Aircraft familiarisation visits
 - (1) Aircraft visits should enable the cabin crew member to become familiar with the aircraft environment and its equipment. Accordingly, aircraft visits should be conducted by appropriately qualified persons. The aircraft visit should provide an overview of the aircraft's exterior, interior and aircraft systems with emphasis on the following:
 - (i) interphone and public address systems;
 - (ii) evacuation alarm systems;
 - (iii) emergency lighting;
 - (iv) smoke detection systems;
 - (v) safety and emergency equipment;
 - (vi) flight crew compartment;
 - (vii) cabin crew stations;
 - (viii) lavatories;
 - (ix) galleys, galley security and water shut-off;
 - (x) cargo areas if accessible from the passenger compartment during flight;
 - (xi) circuit breaker panels located in the passenger compartment;
 - (xii) crew rest areas;
 - (xiii) doors/exits location and environment; and
 - (xiv) IFE system used for conveying safety-related information.
 - (2) An aircraft familiarisation visit may be combined with the aircraft type specific training or operator conversion training required by [ORO.CC.125](#).
- (d) For cabin crew members assigned to operations other than CAT, familiarisation should be completed by means of an aircraft familiarisation visit, or a familiarisation flight, as appropriate taking into account the aircraft type to be operated by the cabin crew member.

ORO.CC.140 Recurrent training

Regulation (EU) No 965/2012

- (a) Each cabin crew member shall complete annually recurrent training and checking.
- (b) Recurrent training shall cover the actions assigned to each member of the cabin crew in normal and emergency procedures and drills relevant to each aircraft type and/or variant to be operated.

-
- (c) Aircraft type specific training elements:
- (1) Recurrent training shall include annually touch-drills by each cabin crew member for simulating the operation of each type or variant of normal and emergency doors and exits for passenger evacuation.
 - (2) Recurrent training shall also include at intervals not exceeding three years:
 - (i) operation and actual opening by each cabin crew member, in a representative training device or in the actual aircraft, of each type or variant of normal and emergency exits in the normal and emergency modes;
 - (ii) actual operation by each cabin crew member, in a representative training device or in the actual aircraft, of the flight crew compartment security door, in both normal and emergency modes, and of the seat and restraint system, and a practical demonstration of the oxygen system equipment relevant to pilot incapacitation;
 - (iii) demonstration of the operation of all other exits including the flight crew compartment windows; and
 - (iv) demonstration of the use of the life-raft, or slide raft, where fitted.
- (d) Operator specific training elements:
- (1) Recurrent training shall include annually:
 - (i) by each cabin crew member:
 - (A) location and handling of all safety and emergency equipment installed or carried on board; and
 - (B) the donning of life-jackets, portable oxygen and protective breathing equipment (PBE);
 - (ii) stowage of articles in the passenger compartment;
 - (iii) procedures related to aircraft surface contamination;
 - (iv) emergency procedures;
 - (v) evacuation procedures;
 - (vi) incident and accident review;
 - (vii) crew resource management;
 - (viii) aero-medical aspects and first aid including related equipment;
 - (ix) security procedures.
 - (2) Recurrent training shall also include at intervals not exceeding three years:
 - (i) use of pyrotechnics (actual or representative devices);
 - (ii) practical demonstration of the use of flight crew checklists;
 - (iii) realistic and practical training in the use of all fire-fighting equipment, including protective clothing, representative of that carried in the aircraft;
 - (iv) by each cabin crew member:
 - (A) extinguishing a fire characteristic of an aircraft interior fire;
 - (B) donning and use of PBE in an enclosed simulated smoke-filled environment.

- (e) Validity periods:
- (1) The annual recurrent training validity period shall be 12 calendar months counted from the end of the month when the check was taken.
 - (2) If the recurrent training and checking required in (a) are undertaken within the last three calendar months of the validity period, the new validity period shall be counted from the original expiry date.
 - (3) For the additional triennial training elements specified in (c)(2) and (d)(2), the validity period shall be 36 calendar months counted from the end of the month when the checks were taken.

AMC1 ORO.CC.140 Recurrent training

ED Decision 2016/004/R

TRAINING PROGRAMMES

- (a) Elements of the annual recurrent training programme
- (1) Training on the location and handling of safety and emergency equipment should include all relevant oxygen systems, and any equipment such as defibrillators if carried on board.
 - (2) Training on emergency procedures should cover pilot incapacitation procedures and crowd control techniques.
 - (3) CRM training should satisfy the following:
 - (i) the applicable training elements specified in Table 1 of [AMC1 ORO.CC.115\(e\)](#) should be covered within a 3-yearcycle to the level required by column 'Annual Recurrent Training';
 - (ii) the definition and implementation of the CRM training programme should be managed by a cabin crew CRM trainer; and
 - (iii) when CRM training is provided by stand-alone modules, it should be conducted by at least one cabin crew CRM trainer.
- (b) Additional triennial elements of recurrent training programme
- (1) Training on the operation of normal and emergency doors/exits should cover failure of power assist systems where fitted. This should include the actions and forces required to operate and deploy evacuation slides, and additional training when relevant for cabin crew members responsible for a pair of doors/exits.
 - (2) Training in the use of all firefighting equipment, including protective clothing, representative of that carried in the aircraft should include individual practice by each cabin crew member to extinguish a fire characteristic of an aircraft interior fire except that, in the case of halon extinguishers, an alternative extinguishing agent may be used. Training should place particular emphasis on identifying the actual source of fire or smoke.
 - (3) Training on normal and emergency procedures for special categories of passengers (SCPs) should cover the specific procedures established by the operator for the carriage of SCPs. The operator may determine that such training is to be completed at shorter intervals, taking into account the route structure, passenger profiles, aircraft types operated, seasonal demands and operations.

ORO.CC.145 Refresher training

Regulation (EU) No 965/2012

- (a) When a cabin crew member, during the preceding six months within the validity period of the last relevant recurrent training and checking:
 - (1) has not performed any flying duties, he/she shall, before being reassigned to such duties, complete refresher training and checking for each aircraft type to be operated; or
 - (2) has not performed flying duties on one particular aircraft type, he/she shall, before being reassigned to duties, complete on that aircraft type:
 - (i) refresher training and checking; or
 - (ii) two familiarisation flights in accordance with [ORO.CC.135](#).
- (b) The refresher training programme for each aircraft type shall at least cover:
 - (1) emergency procedures;
 - (2) evacuation procedures;
 - (3) operation and actual opening, by each cabin crew member, of each type or variant of normal and emergency exits and of the flight crew compartment security door in the normal and emergency modes;
 - (4) demonstration of the operation of all other exits including the flight crew compartment windows;
 - (5) location and handling of all relevant safety and emergency equipment installed or carried on-board.
- (c) The operator may elect to replace refresher training by recurrent training if the reinstatement of the cabin crew member's flying duties commences within the validity period of the last recurrent training and checking. If that validity period has expired, refresher training may only be replaced by aircraft type specific and operator conversion training as specified in [ORO.CC.125](#).

AMC1 ORO.CC.145 Refresher training

ED Decision 2014/017/R

TRAINING PROGRAMME

- (a) Training on emergency procedures should include pilot incapacitation procedures and crowd control techniques as applicable to the aircraft type; and
- (b) Operation of doors and exits by each cabin crew member should include failure of power assist systems where fitted as well as the action and forces required to operate and deploy evacuation slides.

GM1 ORO.CC.145 Refresher training

ED Decision 2014/017/R

FREQUENCY OF REFRESHER TRAINING

For aircraft with complex equipment or procedures, the operator should consider the need for refresher training to be completed by cabin crew members who have been absent from flying duties for less than 6 months.

SECTION 2 – ADDITIONAL REQUIREMENTS FOR COMMERCIAL AIR TRANSPORT OPERATIONS

ORO.CC.200 Senior cabin crew member

Regulation (EU) No 965/2012

- (a) When more than one cabin crew member is required, the composition of the cabin crew shall include a senior cabin crew member nominated by the operator.
- (b) The operator shall nominate cabin crew members to the position of senior cabin crew member only if they:
 - (1) have at least one year of experience as operating cabin crew member; and
 - (2) have successfully completed a senior cabin crew training course and the associated check.
- (c) The senior cabin crew training course shall cover all duties and responsibilities of senior cabin crew members and shall include at least the following elements:
 - (1) pre-flight briefing;
 - (2) cooperation with the crew;
 - (3) review of operator requirements and legal requirements;
 - (4) accident and incident reporting;
 - (5) human factors and crew resource management (CRM); and
 - (6) flight and duty time limitations and rest requirements.
- (d) The senior cabin crew member shall be responsible to the commander for the conduct and coordination of normal and emergency procedures specified in the operations manual, including for discontinuing non-safety-related duties for safety or security purposes.
- (e) The operator shall establish procedures to select the most appropriately qualified cabin crew member to act as senior cabin crew member if the nominated senior cabin crew member becomes unable to operate. Changes to these procedures shall be notified to the competent authority.

AMC1 ORO.CC.200(c) Senior cabin crew member

ED Decision 2014/017/R

TRAINING PROGRAMME

The senior cabin crew member training course should at least cover the following elements:

- (a) Pre-flight briefing:
 - (1) operating as a crew;
 - (2) allocation of cabin crew stations and responsibilities; and
 - (3) consideration of the particular flight, aircraft type, equipment, area and type of operation, including extended range operations with two-engine aeroplanes (ETOPS) and special categories of passengers with emphasis on passengers with disabilities or reduced mobility, infants and stretcher cases.

- (b) Cooperation within the crew:
 - (1) discipline, responsibilities and chain of command;
 - (2) importance of coordination and communication; and
 - (3) pilot incapacitation.
- (c) Review of operator requirements and legal requirements:
 - (1) passenger briefing, safety briefing cards;
 - (2) securing of galleys;
 - (3) stowage of cabin baggage;
 - (4) electronic equipment;
 - (5) procedures when fuelling with passengers on board;
 - (6) turbulence; and
 - (7) documentation.
- (d) Accident and incident reporting.
- (e) Human factors and CRM:

The operator should ensure that all applicable elements specified in Table 1 of [AMC1 ORO.CC.115\(e\)](#) are integrated into the training and covered to the level required by Column 'Senior Cabin Crew Course'.

- (f) Flight and duty time limitations and rest requirements (FTL).

AMC1 ORO.CC.200(d) Senior cabin crew member

ED Decision 2014/017/R

RESPONSIBILITY TO THE COMMANDER

When the level of turbulence so requires, and in the absence of any instructions from the flight crew, the senior cabin crew member should be entitled to discontinue non-safety-related duties and advise the flight crew of the level of turbulence being experienced and the need for the fasten seat belt signs to be switched on. This should be followed by the cabin crew securing the passenger cabin and other relevant areas.

AMC1 ORO.CC.200(e) Senior cabin crew member

ED Decision 2015/005/R

UNABLE TO OPERATE

- (a) Replacement of senior cabin crew member at a base of the operator

A senior cabin crew member who did not report for or cannot commence the assigned flight or series of flights originating from a base of the operator should be replaced without undue delay. The flight should not depart unless another senior cabin crew member has been assigned.
- (b) Replacement of incapacitated or unavailable senior cabin crew member
 - (1) A senior cabin crew member, who becomes incapacitated during a flight or series of flights, or unavailable at a stopover (layover) point, should be replaced without undue delay by another senior cabin crew member qualified on the concerned aircraft type/variant. If there is no other senior cabin crew member, the most appropriately

qualified cabin crew member should be assigned to act as senior cabin crew member in order to reach a base of the operator.

- (2) If during the series of flights the aircraft transits via a base of the operator, the assigned cabin crew member acting as senior cabin crew member should be replaced by another senior cabin crew member.

AMC2 ORO.CC.200(e) Senior cabin crew member

ED Decision 2015/005/R

MOST APPROPRIATELY QUALIFIED CABIN CREW MEMBER

Selection of the most appropriately qualified cabin crew member should take into account if the individual's experience as operating cabin crew member is adequate for the conduct of duties required of a senior cabin crew member. The selected cabin crew member should have operational experience on the concerned aircraft type/variant.

GM1 ORO.CC.200(e) Senior cabin crew member

ED Decision 2015/005/R

REPLACEMENT OF INCAPACITATED OR UNAVAILABLE SENIOR CABIN CREW MEMBER BY ANOTHER SENIOR CABIN CREW MEMBER

To ensure that another senior cabin crew member is assigned without undue delay, the operator should take appropriate measures. These include, but are not limited to, the following:

- (a) to ensure that a flight or series of flights do not depart from an aerodrome where a senior cabin crew member is available or can be made available, the operator may:
 - (1) appoint a senior cabin crew member originally assigned to another flight and who is available at the concerned base or stopover (layover) point if the reporting time for that flight provides sufficient time to find a replacement; or
 - (2) assign a senior cabin crew member who is on standby to operate the flight or to position to the destination where the nominated senior cabin crew member has become incapacitated or unavailable to operate;
- (b) the operator should utilise another senior cabin crew member if she/he is among the operating crew on the same flight;
- (c) in case of unavailable senior cabin crew member, the operator should use the available time and resources to replace him/her at the stopover (layover) point with another senior cabin crew member;
- (d) the operator should consider including the identification of the most appropriately qualified cabin crew member in pre-flight briefings.

GM2 ORO.CC.200(e) Senior cabin crew member

ED Decision 2015/005/R

FLIGHT OR SERIES OF FLIGHTS

Flight or series of flights refers to a period that commences when a cabin crew member is required to report for duty, which includes a sector or a series of sectors, and finishes when the aircraft finally comes to rest and the engines are shut down, at the end of the last sector on which the cabin crew member acts as an operating crew member.

ORO.CC.205 Reduction of the number of cabin crew members during ground operations and in unforeseen circumstances

Regulation (EU) 2019/1384

- (a) Whenever passengers are on board an aircraft, the minimum number of cabin crew members required in accordance with point [ORO.CC.100](#) shall be present in the aircraft and ready to act.
- (b) By way of derogation from point (a), the minimum number of cabin crew members may be reduced in either of the following cases:
 - (1) during normal ground operations not involving refuelling or defuelling when the aircraft is at its parking station;
 - (2) in unforeseen circumstances if the number of passengers carried on the flight is reduced. In this case, a report shall be submitted to the competent authority after completion of the flight;
 - (3) for the purpose of providing in-flight rest during the cruise phase, either in accordance with point [ORO.FTL.205\(e\)](#) or as a fatigue mitigation implemented by the operator.
- (c) For the purposes of points (b)(1) and (b)(2), the operator's procedures of the operations manual shall ensure that:
 - (1) an equivalent level of safety is achieved with the reduced number of cabin crew members, in particular for evacuation of passengers;
 - (2) despite the reduced number of cabin crew members a senior cabin crew member is present in accordance with point [ORO.CC.200](#);
 - (3) at least one cabin crew member is required for every 50, or fraction of 50, passengers present on the same deck of the aircraft;
 - (4) in the case of normal ground operations with aircraft requiring more than one cabin crew member, the number determined in accordance with point (3) shall be increased by one cabin crew member per each pair of floor level emergency exits.
- (d) For the purposes of point (b)(3), the operator shall:
 - (1) conduct a risk assessment to determine the number of cabin crew members who are to be present and ready to act at all times during cruise;
 - (2) identify measures to mitigate the effects of having a lower number of cabin crew members being present and ready to act during cruise;
 - (3) establish in the operations manual specific procedures, including for the in-flight rest of the senior cabin crew member, that ensure at all times appropriate passenger handling and efficient management of any abnormal or emergency situations;
 - (4) specify, in the flight time specification scheme in accordance with point [ORO.FTL.125](#), the conditions under which in-flight rest may be provided to the cabin crew members.

GM1 ORO.CC.205(a) Reduction of the number of cabin crew members during ground operations and in unforeseen circumstances

ED Decision 2019/019/R

CABIN CREW PRESENT AND READY TO ACT

‘Present and ready to act’ means that cabin crew members should be awake and in a state of alertness that enables them to fulfil their responsibilities and perform their duties as required by any situation in accordance with all applicable normal and emergency procedures established in the operations manual.

GM1 ORO.CC.205(b)(2) Reduction of the number of cabin crew during ground operations and in unforeseen circumstances

ED Decision 2015/005/R

UNFORESEEN CIRCUMSTANCES

Unforeseen circumstances in this context refer to incapacitation and unavailability of a senior cabin crew member or a cabin crew member as follows:

- (a) ‘Incapacitation’ means a sudden degradation of medical fitness that occurs during flight duty period either in-flight or during a flight transit of the same flight duty period away from operator’s base and that precludes the senior cabin crew member or cabin crew member from performing his/her duties. Incapacitation prior to dispatch of the aircraft from a base of the operator does not substantiate a reduction of the cabin crew complement below the minimum required.
- (b) ‘Unavailability’ means circumstances at a stopover (layover) destination that preclude the senior cabin crew member or cabin crew member from reporting for the flight duty period, such as traffic jams that prevent the senior cabin crew member or cabin crew member from presenting himself/herself at the crew pick-up point in time, difficulties with local authorities, health problems, death, etc. Unavailability does not refer to insufficient number or absence of cabin crew members on standby, or absence from work due to pregnancy, maternity/paternity leave, parental leave, medical leave, sick leave, or any other absence from work.

AMC1 ORO.CC.205(c)(1) Reduction of the number of cabin crew members during ground operations and in unforeseen circumstances

ED Decision 2019/019/R

PROCEDURES WITH REDUCED NUMBER OF CABIN CREW

- (a) During ground operations, if reducing the applicable minimum required number of cabin crew, the operator should ensure that the procedures required by [ORO.CC.205\(c\)\(1\)](#) specify that:
 - (1) electrical power is available on the aircraft;
 - (2) a means of initiating an evacuation is available to the senior cabin crew member or at least one member of the flight crew is in the flight crew compartment;
 - (3) cabin crew stations and associated duties are specified in the operations manual; and

- (4) cabin crew remain aware of the position of servicing and loading vehicles at and near the exits.
Additionally, in the case of passengers' embarkation:
 - (5) the senior cabin crew member should have performed the pre-boarding safety briefing to the cabin crew; and
 - (6) the pre-boarding cabin checks should have been completed.
- (b) If, in unforeseen circumstances, the number of cabin crew members is reduced below the applicable minimum required number, for example in the event of incapacitation or unavailability of cabin crew, the procedures established for this purpose in the operations manual should take into consideration at least the following:
- (1) reduction of passenger numbers;
 - (2) reseating of passengers with due regard to doors/exits and other applicable limitations; and
 - (3) relocation of cabin crew taking into account the factors specified in [AMC1 ORO.CC.100](#) and any change of procedures.

AMC1 ORO.CC.205(d) Reduction of the number of cabin crew members during ground operations and in unforeseen circumstances

ED Decision 2019/019/R

RISK ASSESSMENT FOR CRUISE PHASE OPERATION WITH A LOWER NUMBER OF CABIN CREW MEMBERS

When conducting the risk assessment required under [ORO.CC.205\(d\)](#), the operator should:

- (a) assess the risks as relevant to the type and duration of the flight to be operated, aeroplane type, cabin configuration, passenger seating capacity, the number and qualification of the operating cabin crew members, and the particular flight duty period (FDP);
- (b) determine how many cabin crew members should be present and ready to act at any time to realistically manage the normal and emergency procedures to be applied during cruise; and
- (c) evaluate the time and conditions necessary for the cabin crew members taking in-flight rest to reach their assigned cabin crew stations in case of an emergency.

AMC2 ORO.CC.205(d) Reduction of the number of cabin crew members during ground operations and in unforeseen circumstances

ED Decision 2019/019/R

SPECIFIC PROCEDURES FOR CRUISE PHASE OPERATION WITH A LOWER NUMBER OF CABIN CREW MEMBERS IN THE PASSENGER COMPARTMENT

- (a) When establishing the specific procedures for cruise phase operation with a lower number of cabin crew members in the passenger compartment, the operator should at least consider the following:
 - (1) Normal procedures including at least:

- (i) surveillance of the passenger compartment, including the lavatories and the galleys;
 - (ii) management of, and assistance to, passengers;
 - (iii) crew communication and coordination, including the necessary contact with and support to the flight crew as specified by the operator.
- (2) Emergency procedures including at least those to be applied in case of:
 - (i) medical emergency;
 - (ii) unruly behaviour;
 - (iii) unlawful interference or bomb threat;
 - (iv) slow depressurisation;
 - (v) decompression;
 - (vi) fire or smoke event;
 - (vii) emergency descent, taking into account that the procedure to be applied may vary depending on the causing event (e.g. depressurisation or fire).
- (c) Specific procedures for cruise phase operation with a lower number of cabin crew should describe:
 - (1) how to re-assign duties and responsibilities of cabin crew members or senior crew members who take in-flight rest to another cabin crew member considering the experience and qualification of the cabin crew member or senior cabin crew member; and
 - (2) how cabin crew members taking in-flight rest can be again ready to act and reach their assigned cabin crew stations in case of an emergency.

ORO.CC.210 Additional conditions for assignment to duties

Regulation (EU) No 965/2012

Cabin crew members shall only be assigned to duties, and operate, on a particular aircraft type or variant if they:

- (a) hold a valid attestation issued in accordance with Annex V (Part-CC) to Regulation (EU) No 1178/2011;
- (b) are qualified on the type or variant in accordance with this Subpart;
- (c) comply with the other applicable requirements of this Subpart and Annex IV (Part-CAT);
- (d) wear the operator's cabin crew uniform.

GM1 ORO.CC.210(d) Additional conditions for assignment to duties

ED Decision 2014/017/R

OPERATOR'S CABIN CREW UNIFORM

The uniform to be worn by operating cabin crew should be such as not to impede the performance of their duties, as required for the safety of passengers and flight during operations, and should allow passengers to identify the operating cabin crew including in an emergency situation.

ORO.CC.215 Training and checking programs and related documentation

Regulation (EU) No 965/2012

- (a) Training and checking programmes including syllabi required by this Subpart shall be approved by the competent authority and specified in the operations manual.
- (b) After a cabin crew member has successfully completed a training course and the associated check, the operator shall:
 - (1) update the cabin crew member's training records in accordance with [ORO.MLR.115](#); and
 - (2) provide him/her with a list showing updated validity periods as relevant to the aircraft type(s) and variant(s) on which the cabin crew member is qualified to operate.

GM1 ORO.CC.215(b)(2) Training and checking programmes and related documentation

ED Decision 2014/017/R

LIST OF AIRCRAFT TYPE/VARIANT QUALIFICATION(S)

When providing the updated validity list of aircraft type/variant qualifications to cabin crew members having successfully completed a training course and the associated checking, the operator may use the following format. If using another format, at least the elements in (a) to (d) and in columns (1) and (2) should be indicated to show validity of qualification(s).

CABIN CREW AIRCRAFT TYPE/VARIANT QUALIFICATION(S)							
(a)	Reference number of the cabin crew attestation:						
(b)	Cabin crew attestation holder's full name: The above-mentioned person may act as an operating cabin crew member during flight operations only if his/her aircraft type and/or variant qualification(s) listed below, and dated DD/MM/YYYY, comply with the applicable validity period(s) specified in Part-ORO.						
(c)	Issuing organisation: (name, postal address, AOC and/or approval reference number and stamp or logo)						
(d)	Date of issue: (DD/MM/YYYY)						
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)
	Qualification valid until	Aircraft type specific training	Operator conversion training	Differences training If relevant	Familiarisation	Last recurrent training	Refresher training If relevant
A/C type 1							
Variant ...							
A/C type 2							
Variant ...							
A/C type 3							
Variant ...							
If approved A/C type 4							

ORO.CC.250 Operation on more than one aircraft type or variant

Regulation (EU) No 71/2014

- (a) A cabin crew member shall not be assigned to operate on more than three aircraft types, except that, with the approval of the competent authority, the cabin crew member may be assigned to operate on four aircraft types if for at least two of the types:
 - (1) safety and emergency equipment and type-specific normal and emergency procedures are similar; and
 - (2) non-type-specific normal and emergency procedures are identical.
- (b) For the purpose of (a) and for cabin crew training and qualifications, the operator shall determine:
 - (1) each aircraft as a type or a variant taking into account, where available, the relevant elements defined in the mandatory part of the operational suitability data established in accordance with Regulation (EU) No 748/2012 for the relevant aircraft type or variant; and
 - (2) variants of an aircraft type to be different types if they are not similar in the following aspects:
 - (i) emergency exit operation;
 - (ii) location and type of portable safety and emergency equipment;
 - (iii) type-specific emergency procedures.

AMC1 ORO.CC.250(b) Operation on more than one aircraft type or variant

ED Decision 2014/017/R

DETERMINATION OF AIRCRAFT TYPES AND VARIANTS

- (a) When determining similarity of location and type of portable safety and emergency equipment, the following factors should be assessed:
 - (1) all portable safety and emergency equipment is stowed in the same, or in exceptional circumstances, in substantially the same location;
 - (2) all portable safety and emergency equipment requires the same method of operation;
 - (3) portable safety and emergency equipment includes:
 - (i) fire-fighting equipment;
 - (ii) protective breathing equipment (PBE);
 - (iii) oxygen equipment;
 - (iv) crew life-jackets;
 - (v) torches;
 - (vi) megaphones;
 - (vii) first-aid equipment;
 - (viii) survival and signalling equipment; and
 - (ix) other safety and emergency equipment, where applicable.

- (b) The type-specific emergency procedures to be considered should include at least the following:
 - (1) land and water evacuation;
 - (2) in-flight fire;
 - (3) non-pressurisation, slow and sudden decompression; and
 - (4) pilot incapacitation.
- (c) When determining similarity of doors/exits in the absence of operational suitability data established in accordance with Commission Regulation (EU) No 748/2012 for the relevant aircraft type(s) or variant(s), the following factors should be assessed, except for self-help exits, such as type III and type IV exits, that need not be included in the assessment:
 - (1) door/exit arming and disarming;
 - (2) direction of movement of the operating handle;
 - (3) direction of door/exit opening;
 - (4) power assist mechanisms; and
 - (5) assisting evacuation means.

GM1 ORO.CC.250 Operation on more than one aircraft type or variant

ED Decision 2014/017/R

SAFETY BRIEFING FOR CABIN CREW

When changing aircraft type or variant during a series of flight sectors, the cabin crew safety briefing should include a representative sample of type-specific normal and emergency procedures and safety and emergency equipment applicable to the actual aircraft to be operated for the immediately subsequent flight sector.

ORO.CC.255 Single cabin crew member operations

Regulation (EU) No 965/2012

- (a) The operator shall select, recruit, train and check the proficiency of cabin crew members to be assigned to single cabin crew member operations according to criteria appropriate to this type of operation.
- (b) Cabin crew members who have no previous operating experience as single cabin crew member shall only be assigned to such type of operation after they have:
 - (1) completed training as required in (c) in addition to other applicable training and checking required by this Subpart;
 - (2) successfully passed the checks verifying their proficiency in discharging their duties and responsibilities in accordance with the procedures specified in the operations manual; and
 - (3) undertaken familiarisation flying of at least 20 hours and 15 sectors on the relevant aircraft type under the supervision of an appropriately experienced cabin crew member.

- (c) The following additional training elements shall be covered with particular emphasis to reflect single cabin crew operations:
- (1) responsibility to the commander for the conduct of normal and emergency procedures;
 - (2) importance of coordination and communication with the flight crew, in particular when managing unruly or disruptive passengers;
 - (3) review of operator requirements and legal requirements;
 - (4) documentation;
 - (5) accident and incident reporting; and
 - (6) flight and duty time limitations and rest requirements.

SUBPART TC: TECHNICAL CREW IN HEMS, HHO OR NVIS OPERATIONS

ORO.TC.100 Scope

Regulation (EU) No 965/2012

This Subpart establishes the requirements to be met by the operator when operating an aircraft with technical crew members in commercial air transport helicopter emergency medical service (HEMS), night vision imaging system (NVIS) operations or helicopter hoist operations (HHO).

ORO.TC.105 Conditions for assignment to duties

Regulation (EU) No 965/2012

- (a) Technical crew members in commercial air transport HEMS, HHO or NVIS operations shall only be assigned duties if they:
 - (1) are at least 18 years of age;
 - (2) are physically and mentally fit to safely discharge assigned duties and responsibilities;
 - (3) have completed all applicable training required by this Subpart to perform the assigned duties;
 - (4) have been checked as proficient to perform all assigned duties in accordance with the procedures specified in the operations manual.
- (b) Before assigning to duties technical crew members who are self-employed and/or working on a freelance or part-time basis, the operator shall verify that all applicable requirements of this Subpart are complied with, taking into account all services rendered by the technical crew member to other operator(s) to determine in particular:
 - (1) the total number of aircraft types and variants operated;
 - (2) the applicable flight and duty time limitations and rest requirements.

GM1 ORO.TC.105 Conditions for assignment to duties

ED Decision 2014/017/R

GENERAL

- (a) The technical crew member in HEMS, HHO or NVIS operations should undergo an initial medical examination or assessment and, if applicable, a re-assessment before undertaking duties.
- (b) Any medical assessment or re-assessment should be carried out according to best aero-medical practice by a medical practitioner who has sufficiently detailed knowledge of the applicant's medical history.
- (c) The operator should maintain a record of medical fitness for each technical crew member.
- (d) Technical crew members should:
 - (1) be in good health;
 - (2) be free from any physical or mental illness that might lead to incapacitation or inability to perform crew duties;
 - (3) have normal cardio-respiratory function;

- (4) have normal central nervous system;
- (5) have adequate visual acuity 6/9 with or without glasses;
- (6) have adequate hearing; and
- (7) have normal function of ear, nose and throat.

ORO.TC.110 Training and checking

Regulation (EU) No 965/2012

- (a) The operator shall establish a training programme in accordance with the applicable requirements of this Subpart to cover the duties and responsibilities to be performed by technical crew members.
- (b) Following the completion of initial, operator conversion, differences and recurrent training, each technical crew member shall undergo a check to demonstrate their proficiency in carrying out normal and emergency procedures.
- (c) Training and checking shall be conducted for each training course by personnel suitably qualified and experienced in the subject to be covered. The operator shall inform the competent authority about the personnel conducting the checks.

AMC1 ORO.TC.110 Training and checking

ED Decision 2014/017/R

GENERAL

- (a) Elements of training that require individual practice may be combined with practical checks.
- (b) The checks should be accomplished by the method appropriate to the type of training including:
 - (1) practical demonstration;
 - (2) computer-based assessment;
 - (3) in-flight checks; and/or
 - (4) oral or written tests.

AMC1 ORO.TC.110(a) Training and checking

ED Decision 2015/022/R

CRM TRAINING

The technical crew training programme for initial, operator conversion and recurrent training should include relevant CRM training elements as specified in [AMC1 ORO.FC.115](#).

ORO.TC.115 Initial training

Regulation (EU) No 965/2012

Before undertaking the operator conversion training, each technical crew member shall complete initial training, including:

- (a) general theoretical knowledge on aviation and aviation regulations covering all elements relevant to the duties and responsibilities required of technical crew;
- (b) fire and smoke training;

- (c) survival training on ground and in water, appropriate to the type and area of operation;
- (d) aero-medical aspects and first-aid;
- (e) communication and relevant CRM elements of [ORO.FC.115](#) and [ORO.FC.215](#).

AMC1 ORO.TC.115 Initial training

ED Decision 2015/022/R

ELEMENTS

- (a) The elements of initial training mentioned in [ORO.TC.115](#) should include in particular:
 - (1) General theoretical knowledge on aviation and aviation regulations relevant to duties and responsibilities:
 - (i) the importance of crew members performing their duties in accordance with the operations manual;
 - (ii) continuing competence and fitness to operate as a crew member with special regard to flight and duty time limitations and rest requirements;
 - (iii) an awareness of the aviation regulations relating to crew members and the role of the competent and inspecting authority;
 - (iv) general knowledge of relevant aviation terminology, theory of flight, passenger distribution, meteorology and areas of operation;
 - (v) pre-flight briefing of the crew members and the provision of necessary safety information with regard to their specific duties;
 - (vi) the importance of ensuring that relevant documents and manuals are kept up-to-date with amendments provided by the operator;
 - (vii) the importance of identifying when crew members have the authority and responsibility to initiate an evacuation and other emergency procedures; and
 - (viii) the importance of safety duties and responsibilities and the need to respond promptly and effectively to emergency situations.
 - (2) Fire and smoke training:
 - (i) reactions to emergencies involving fire and smoke and identification of the fire sources;
 - (ii) the classification of fires and the appropriate type and techniques of application of extinguishing agents, the consequences of misapplication, and of use in a confined space; and
 - (iii) the general procedures of ground-based emergency services at aerodromes.
 - (3) When conducting extended overwater operations, water survival training, including the use of personal flotation equipment.
 - (4) Before first operating on an aircraft fitted with life-rafts or other similar equipment, training on the use of this equipment, including practice in water.
 - (5) Survival training appropriate to the areas of operation (e.g. polar, desert, jungle, sea or mountain).

- (6) Aero-medical aspects and first aid, including:
 - (i) instruction on first aid and the use of first-aid kits; and
 - (ii) the physiological effects of flying.
- (7) Effective communication between technical crew members and flight crew members, including common language and terminology.

ORO.TC.120 Operator conversion training

Regulation (EU) No 965/2012

Each technical crew member shall complete:

- (a) operator conversion training, including relevant CRM elements,
 - (1) before being first assigned by the operator as a technical crew member; or
 - (2) when changing to a different aircraft type or class, if any of the equipment or procedures mentioned in (b) are different.
- (b) Operator conversion training shall include:
 - (1) the location and use of all safety and survival equipment carried on the aircraft;
 - (2) all normal and emergency procedures;
 - (3) on-board equipment used to carry out duties in the aircraft or on the ground for the purpose of assisting the pilot during HEMS, HHO or NVIS operations.

AMC1 ORO.TC.120&.125 Operator conversion training and differences training

ED Decision 2014/017/R

ELEMENTS

- (a) Operator conversion training mentioned in [ORO.TC.120\(b\)](#) and differences training mentioned in [ORO.TC.125\(a\)](#) should include the following:
 - (1) Fire and smoke training, including practical training in the use of all fire fighting equipment as well as protective clothing representative of that carried in the aircraft. Each technical crew member should:
 - (i) extinguish a fire characteristic of an aircraft interior fire except that, in the case of Halon extinguishers, an alternative extinguishing agent may be used; and
 - (ii) practise the donning and use of protective breathing equipment (when fitted) in an enclosed, simulated smoke-filled environment.
 - (2) Practical training on operating and opening all normal and emergency exits for passenger evacuation in an aircraft or representative training device and demonstration of the operation of all other exits.
 - (3) Evacuation procedures and other emergency situations, including:
 - (i) recognition of planned or unplanned evacuations on land or water — this training should include recognition of unusable exits or unserviceable evacuation equipment;
 - (ii) in-flight fire and identification of fire source; and

- (iii) other in-flight emergencies.
- (4) When the flight crew is more than one, training on assisting if a pilot becomes incapacitated, including a demonstration of:
 - (i) the pilot's seat mechanism;
 - (ii) fastening and unfastening the pilot's seat restraint system;
 - (iii) use of the pilot's oxygen equipment, when applicable; and
 - (iv) use of pilots' checklists.
- (5) Training on, and demonstration of, the location and use of safety equipment, including the following:
 - (i) life rafts, including the equipment attached to, and/or carried in, the raft, where applicable;
 - (ii) life jackets, infant life jackets and flotation devices, where applicable;
 - (iii) fire extinguishers;
 - (iv) crash axe or crow bar;
 - (v) emergency lights, including portable lights;
 - (vi) communication equipment, including megaphones;
 - (vii) survival packs, including their contents;
 - (viii) pyrotechnics (actual or representative devices);
 - (ix) first-aid kits, their contents and emergency medical equipment; and
 - (x) other safety equipment or systems, where applicable.
- (6) Training on passenger briefing/safety demonstrations and preparation of passengers for normal and emergency situations.
- (7) Training on the use of dangerous goods, if applicable.
- (8) Task-specific training.

AMC2 ORO.TC.120&.125 Operator conversion training and differences training

ED Decision 2014/017/R

GENERAL

- (a) The operator should determine the content of the conversion or differences training taking account of the technical crew member's previous training as documented in the technical crew member's training records.
- (b) Aircraft conversion or differences training should be conducted according to a syllabus and include the use of relevant equipment and emergency procedures and practice on a representative training device or on the actual aircraft.
- (c) The operator should specify in the operations manual the maximum number of types or variants that can be operated by a technical crew member.

ORO.TC.125 Differences training

Regulation (EU) No 965/2012

- (a) Each technical crew member shall complete differences training when changing equipment or procedures on types or variants currently operated.
- (b) The operator shall specify in the operations manual when such differences training is required.

ORO.TC.130 Familiarisation flights

Regulation (EU) No 965/2012

Following completion of the operator conversion training, each technical crew member shall undertake familiarisation flights prior to operating as a required technical crew member in HEMS, HHO or NVIS operations.

ORO.TC.135 Recurrent training

Regulation (EU) No 965/2012

- (a) Within every 12-month period, each technical crew member shall undergo recurrent training relevant to the type or class of aircraft and equipment that the technical crew member operates. Elements of CRM shall be integrated into all appropriate phases of the recurrent training.
- (b) Recurrent training shall include theoretical and practical instruction and practice.

AMC1 ORO.TC.135 Recurrent training

ED Decision 2014/017/R

ELEMENTS

- (a) The 12-month period mentioned in [ORO.TC.135\(a\)](#) should be counted from the last day of the month when the first checking was made. Further training and checking should be undertaken within the last 3 calendar months of that period. The new 12-month period should be counted from the original expiry date.
- (b) The recurrent practical training should include every year:
 - (1) emergency procedures, including pilot incapacitation;
 - (2) evacuation procedures;
 - (3) touch-drills by each technical crew member for opening normal and emergency exits for (passenger) evacuation;
 - (4) the location and handling of emergency equipment and the donning by each technical crew member of life jackets and protective breathing equipment (PBE), when applicable;
 - (5) first aid and the contents of the first-aid kit(s);
 - (6) stowage of articles in the cabin;
 - (7) use of dangerous goods, if applicable;
 - (8) incident and accident review; and
 - (9) crew resource management: all major topics of the initial CRM training should be covered over a period not exceeding 3 years.

- (c) Recurrent training should include every 3 years:
- (1) practical training on operating and opening all normal and emergency exits for passenger evacuation in an aircraft or representative training device and demonstration of the operation of all other exits;
 - (2) practical training in the use of all firefighting equipment as well as protective clothing representative of that carried in the aircraft. Each technical crew member should:
 - (i) extinguish a fire characteristic of an aircraft interior fire except that, in the case of Halon extinguishers, an alternative extinguishing agent may be used; and
 - (ii) practise the donning and use of protective breathing equipment (when fitted) in an enclosed, simulated smoke-filled environment;
 - (3) use of pyrotechnics (actual or representative devices); and
 - (4) demonstration of the use of the life raft, where fitted.

ORO.TC.140 Refresher training

Regulation (EU) No 965/2012

- (a) Each technical crew member who has not undertaken duties in the previous six months shall complete the refresher training specified in the operations manual.
- (b) The technical crew member who has not performed flying duties on one particular aircraft type or class during the preceding six months shall, before being assigned on that type or class, complete either:
 - (1) refresher training on the type or class; or
 - (2) two familiarisation sectors on the aircraft type or class.

AMC1 ORO.TC.140 Refresher training

ED Decision 2014/017/R

ELEMENTS

- (a) Refresher training may include familiarisation flights.
- (b) Refresher training should include at least the following:
 - (1) emergency procedures, including pilot incapacitation;
 - (2) evacuation procedures;
 - (3) practical training on operating and opening all normal and emergency exits for passenger evacuation in an aircraft or representative training device and demonstration of the operation of all other exits; and
 - (4) the location and handling of emergency equipment, and the donning of life jackets and protective breathing equipment, when applicable.

SUBPART FTL: FLIGHT AND DUTY TIME LIMITATIONS AND REST REQUIREMENTS

SECTION 1 – GENERAL

ORO.FTL.100 Scope

Regulation (EU) No 83/2014

This Subpart establishes the requirements to be met by an operator and its crew members with regard to flight and duty time limitations and rest requirements for crew members.

ORO.FTL.105 Definitions

Regulation (EU) 2018/1975

For the purpose of this Subpart, the following definitions shall apply:

- (1) ‘acclimatised’ means a state in which a crew member’s circadian biological clock is synchronised to the time zone where the crew member is. A crew member is considered to be acclimatised to a 2-hour wide time zone surrounding the local time at the point of departure. When the local time at the place where a duty commences differs by more than 2 hours from the local time at the place where the next duty starts, the crew member, for the calculation of the maximum daily flight duty period, is considered to be acclimatised in accordance with the values in the Table 1.

Table 1

Time difference (h) between reference time and local time where the crew member starts the next duty	Time elapsed since reporting at reference time				
	<48	48–71:59	72–95:59	96–119:59	≥120
< 4	B	D	D	D	D
≤6	B	X	D	D	D
≤9	B	X	X	D	D
≤12	B	X	X	X	D

‘B’ means acclimatised to the local time of the departure time zone,

‘D’ means acclimatised to the local time where the crew member starts his/her next duty, and

‘X’ means that a crew member is in an unknown state of acclimatisation.

- (2) ‘reference time’ means the local time at the reporting point situated in a 2-hour wide time zone band around the local time where a crew member is acclimatised;
- (3) ‘accommodation’ means, for the purpose of standby and split duty, a quiet and comfortable place not open to the public with the ability to control light and temperature, equipped with adequate furniture that provides a crew member with the possibility to sleep, with enough capacity to accommodate all crew members present at the same time and with access to food and drink;
- (4) ‘suitable accommodation’ means, for the purpose of standby, split duty and rest, a separate room for each crew member located in a quiet environment and equipped with a bed, which is

- sufficiently ventilated, has a device for regulating temperature and light intensity, and access to food and drink;
- (5) 'augmented flight crew' means a flight crew which comprises more than the minimum number required to operate the aircraft, allowing each flight crew member to leave the assigned post, for the purpose of in-flight rest, and to be replaced by another appropriately qualified flight crew member;
 - (6) 'break' means a period of time within an flight duty period, shorter than a rest period, counting as duty and during which a crew member is free of all tasks;
 - (7) 'delayed reporting' means the postponement of a scheduled FDP by the operator before a crew member has left the place of rest;
 - (8) 'disruptive schedule' means a crew member's roster which disrupts the sleep opportunity during the optimal sleep time window by comprising an FDP or a combination of FDPs which encroach, start or finish during any portion of the day or of the night where a crew member is acclimatised. A schedule may be disruptive due to early starts, late finishes or night duties.
 - (a) 'early type' of disruptive schedule means:
 - (i) for 'early start' a duty period starting in the period between 05:00 and 05:59 in the time zone to which a crew member is acclimatised, and
 - (ii) for 'late finish' a duty period finishing in the period between 23:00 and 01:59 in the time zone to which a crew member is acclimatised;
 - (b) 'late type' of disruptive schedule means:
 - (i) for 'early start' a duty period starting in the period between 05:00 and 06:59 in the time zone to which a crew member is acclimatised; and
 - (ii) for 'late finish' a duty period finishing in the period between 00:00 and 01:59 in the time zone to which a crew member is acclimatised;
 - (9) 'night duty' means a duty period encroaching any portion of the period between 02:00 and 04:59 in the time zone to which the crew is acclimatised;
 - (10) 'duty' means any task that a crew member performs for the operator, including flight duty, administrative work, giving or receiving training and checking, positioning, and some elements of standby;
 - (11) 'duty period' means a period which starts when a crew member is required by an operator to report for or to commence a duty and ends when that person is free of all duties, including post-flight duty;
 - (12) 'flight duty period ('FDP')' means a period that commences when a crew member is required to report for duty, which includes a sector or a series of sectors, and finishes when the aircraft finally comes to rest and the engines are shut down, at the end of the last sector on which the crew member acts as an operating crew member;
 - (13) 'flight time' means, for aeroplanes, the time between an aircraft first moving from its parking place for the purpose of taking off until it comes to rest on the designated parking position and all engines or propellers are shut down.
 - (14) 'home base' means the location, assigned by the operator to the crew member, from where the crew member normally starts and ends a duty period or a series of duty periods and where, under normal circumstances, the operator is not responsible for the accommodation of the crew member concerned;

- (15) 'local day' means a 24-hour period commencing at 00:00 local time;
- (16) 'local night' means a period of 8 hours falling between 22:00 and 08:00 local time;
- (17) 'operating crew member' means a crew member carrying out duties in an aircraft during a sector;
- (18) 'positioning' means the transferring of a non-operating crew member from one place to another, at the behest of the operator, excluding:
- the time of travel from a private place of rest to the designated reporting place at home base and vice versa, and
 - the time for local transfer from a place of rest to the commencement of duty and vice versa;
- (19) 'rest facility' means a bunk or seat with leg and foot support suitable for crew members' sleeping on board an aircraft.
- (20) 'reserve' means a period of time during which a crew member is required by the operator to be available to receive an assignment for an FDP, positioning or other duty notified at least 10 hours in advance.
- (21) 'rest period' means a continuous, uninterrupted and defined period of time, following duty or prior to duty, during which a crew member is free of all duties, standby and reserve.
- (22) 'rotation' is a duty or a series of duties, including at least one flight duty, and rest periods out of home base, starting at home base and ending when returning to home base for a rest period where the operator is no longer responsible for the accommodation of the crew member.
- (23) 'single day free of duty' means, for the purpose of complying with the provisions of Council Directive 2000/79/EC, a time free of all duties and standby consisting of one day and two local nights, which is notified in advance. A rest period may be included as part of the single day free of duty.
- (24) 'sector' means the segment of an FDP between an aircraft first moving for the purpose of taking off until it comes to rest after landing on the designated parking position.
- (25) 'standby' means a pre-notified and defined period of time during which a crew member is required by the operator to be available to receive an assignment for a flight, positioning or other duty without an intervening rest period.
- (26) 'airport standby' means a standby performed at the airport;
- (27) 'other standby' means a standby either at home or in a suitable accommodation;
- (28) 'window of circadian low ('WOCL') means the period between 02:00 and 05:59 hours in the time zone to which a crew member is acclimatised.

GM1 ORO.FTL.105(1) Definitions

ED Decision 2019/019/R

ACCLIMATISED

- (a) A crew member remains acclimatised to the local time of his or her reference time during 47 hours 59 minutes after reporting no matter how many time zones he/she has crossed.
- (b) The maximum daily FDP for acclimatised crew members is determined by using table 1 of [ORO.FTL.205\(b\)\(1\)](#) with the reference time of the point of departure. As soon as 48 hours have

elapsed, the state of acclimatisation is derived from the time elapsed since reporting at reference time and the number of time zones crossed.

- (c) A crew member is considered to be in an unknown state of acclimatisation after the first 48 hours of the rotation have elapsed unless he or she remains in the first arrival destination time zone (either for rest or any duties) in accordance with the table in [ORO.FTL.105\(1\)](#).
- (d) Should a crew member's rotation include additional duties that end in a different time zone than his or her first arrival destination's time zone while he or she is considered to be in an unknown state of acclimatisation, then the crew member remains in an unknown state of acclimatisation until he or she:
 - (1) has taken the rest period required by [CS FTL.1.235\(b\)\(3\)](#) at home base;
 - (2) has taken the rest period required by [CS FTL.1.235\(b\)\(3\)](#) at the new location; or
 - (3) has been undertaking duties starting at and returning to the time zone of the new location until he or she becomes acclimatised in accordance with the values in the table in [ORO.FTL.105\(1\)](#).

To determine the state of acclimatisation, the two following criteria should be applied:

- (i) the greater of the time differences between the time zone where he or she was last acclimatised or the local time of his or her last departure point and the new location; and
- (ii) the time elapsed since reporting at home base for the first time during the rotation.

GM2 ORO.FTL.105(1) Definitions

ED Decision 2014/017/R

ACCLIMATISED 'POINT OF DEPARTURE'

The point of departure refers to the reporting point for a flight duty period or positioning duty after a rest period.

GM3 ORO.FTL.105(1) Definitions

ED Decision 2014/017/R

ACCLIMATISED 'TIME ELAPSED SINCE REPORTING AT REFERENCE TIME'

The time elapsed since reporting at reference time for operations applying CS FTL.1.235(b)(3)(ii) at home base refers to the time elapsed since reporting for the first time at home base for a rotation.

GM1 ORO.FTL.105(2) Definitions

ED Decision 2014/017/R

REFERENCE TIME

- (a) Reference time refers to reporting points in a 2-hour wide time zone band around the local time where a crew member is acclimatised.
- (b) Example: A crew member is acclimatised to the local time in Helsinki and reports for duty in London. The reference time is the local time in London.

GM1 ORO.FTL.105(3) Definitions

ED Decision 2014/017/R

ADEQUATE FURNITURE FOR 'ACCOMMODATION'

Adequate furniture for crew member accommodation should include a seat that reclines at least 45° back angle to the vertical, has a seat width of at least 20 inches (50cm) and provides leg and foot support.

GM1 ORO.FTL.105(8) Definitions

ED Decision 2014/017/R

DETERMINATION OF DISRUPTIVE SCHEDULES

If a crew member is acclimatised to the local time at his/her home base, the local time at the home base should be used to consider an FDP as 'disruptive schedule'. This applies to operations within the 2-hour wide time zone surrounding the local time at the home base, if a crew member is acclimatised to the local time at his/her home base.

GM1 ORO.FTL.105(10) Definitions

ED Decision 2014/017/R

ELEMENTS OF STANDBY FOR DUTY

[ORO.FTL.225\(c\)](#) and (d) and [CS FTL.1.225\(b\)\(2\)](#) determine which elements of standby count as duty.

GM1 ORO.FTL.105(17) Definitions

ED Decision 2014/017/R

OPERATING CREW MEMBER

A person on board an aircraft is either a crew member or a passenger. If a crew member is not a passenger on board an aircraft he/she should be considered as 'carrying out duties'. The crew member remains an operating crew member during in-flight rest. In-flight rest counts in full as FDP, and for the purpose of [ORO.FTL.210](#).

ORO.FTL.110 Operator responsibilities

Regulation (EU) No 83/2014

An operator shall:

- (a) publish duty rosters sufficiently in advance to provide the opportunity for crew members to plan adequate rest;
- (b) ensure that flight duty periods are planned in a way that enables crew members to remain sufficiently free from fatigue so that they can operate to a satisfactory level of safety under all circumstances;
- (c) specify reporting times that allow sufficient time for ground duties;
- (d) take into account the relationship between the frequency and pattern of flight duty periods and rest periods and give consideration to the cumulative effects of undertaking long duty hours combined with minimum rest periods;
- (e) allocate duty patterns which avoid practices that cause a serious disruption of an established sleep/work pattern, such as alternating day/night duties;

- (f) comply with the provisions concerning disruptive schedules in accordance with [ARO.OPS.230](#);
- (g) provide rest periods of sufficient time to enable crew members to overcome the effects of the previous duties and to be rested by the start of the following flight duty period;
- (h) plan recurrent extended recovery rest periods and notify crew members sufficiently in advance;
- (i) plan flight duties in order to be completed within the allowable flight duty period taking into account the time necessary for pre-flight duties, the sector and turnaround times;
- (j) change a schedule and/or crew arrangements if the actual operation exceeds the maximum flight duty period on more than 33% of the flight duties in that schedule during a scheduled seasonal period.

AMC1 ORO.FTL.110 Operator responsibilities

ED Decision 2014/017/R

SCHEDULING

- (a) Scheduling has an important impact on a crew member's ability to sleep and to maintain a proper level of alertness. When developing a workable roster, the operator should strike a fair balance between the commercial needs and the capacity of individual crew members to work effectively. Rosters should be developed in such a way that they distribute the amount of work evenly among those that are involved.
- (b) Schedules should allow for flights to be completed within the maximum permitted flight duty period and flight rosters should take into account the time needed for pre-flight duties, taxiing, the flight- and turnaround times. Other factors to be considered when planning duty periods should include:
 - (1) the allocation of work patterns which avoid undesirable practices such as alternating day/night duties, alternating eastward-westward or westward-eastward time zone transitions, positioning of crew members so that a serious disruption of established sleep/work patterns occurs;
 - (2) scheduling sufficient rest periods especially after long flights crossing many time zones; and
 - (3) preparation of duty rosters sufficiently in advance with planning of recurrent extended recovery rest periods and notification of the crew members well in advance to plan adequate pre-duty rest.

AMC1 ORO.FTL.110(a) Operator responsibilities

ED Decision 2014/017/R

PUBLICATION OF ROSTERS

Rosters should be published 14 days in advance.

AMC1 ORO.FTL.110(j) Operator responsibilities

ED Decision 2014/017/R

OPERATIONAL ROBUSTNESS OF ROSTERS

The operator should establish and monitor performance indicators for operational robustness of rosters.

GM1 ORO.FTL.110(j) Operator responsibilities

ED Decision 2014/017/R

OPERATIONAL ROBUSTNESS OF ROSTERS

Performance indicators for operational robustness of rosters should support the operator in the assessment of the stability of its rostering system. Performance indicators for operational robustness of rosters should at least measure how often a rostered crew pairing for a duty period is achieved within the planned duration of that duty period. Crew pairing means rostered positioning and flights for crew members in one duty period.

ORO.FTL.115 Crew member responsibilities

Regulation (EU) No 83/2014

Crew members shall:

- (a) comply with point [CAT.GEN.MPA.100\(b\)](#) of Annex IV (Part-CAT); and
- (b) make optimum use of the opportunities and facilities for rest provided and plan and use their rest periods properly.

ORO.FTL.120 Fatigue risk management (FRM)

Regulation (EU) No 83/2014

- (a) When FRM is required by this Subpart or an applicable certification specification, the operator shall establish, implement and maintain a FRM as an integral part of its management system. The FRM shall ensure compliance with the essential requirements in points 7.f., 7.g. and 8.f. of Annex IV to Regulation (EC) No 216/2008. The FRM shall be described in the operations manual.
- (b) The FRM established, implemented and maintained shall provide for continuous improvement to the overall performance of the FRM and shall include:
 - (1) a description of the philosophy and principles of the operator with regard to FRM, referred to as the FRM policy;
 - (2) documentation of the FRM processes, including a process for making personnel aware of their responsibilities and the procedure for amending this documentation;
 - (3) scientific principles and knowledge;
 - (4) a hazard identification and risk assessment process that allows managing the operational risk(s) of the operator arising from crew member fatigue on a continuous basis;
 - (5) a risk mitigation process that provides for remedial actions to be implemented promptly, which are necessary to effectively mitigate the operator's risk(s) arising from crew member fatigue and for continuous monitoring and regular assessment of the mitigation of fatigue risks achieved by such actions;
 - (6) FRM safety assurance processes;
 - (7) FRM promotion processes.
- (c) The FRM shall correspond to the flight time specification scheme, the size of the operator and the nature and complexity of its activities, taking into account the hazards and associated risks inherent in those activities and the applicable flight time specification scheme.
- (d) The operator shall take mitigating actions when the FRM safety assurance process shows that the required safety performance is not maintained.

GM1 ORO.FTL.120 Fatigue risk management (FRM)

ED Decision 2017/007/R

ICAO DOC 9966 — MANUAL FOR THE OVERSIGHT OF FATIGUE MANAGEMENT APPROACHES

Further guidance on FRM processes, appropriate fatigue management, the underlying scientific principles and operational knowledge may be found in ICAO Doc 9966 (Manual for the Oversight of Fatigue Management Approaches).

AMC1 ORO.FTL.120(b)(1) Fatigue risk management (FRM)

ED Decision 2015/005/R

CAT OPERATORS FRM POLICY

- (a) The operator's FRM policy should identify all the elements of FRM.
- (b) The FRM policy should define to which operations FRM applies.
- (c) The FRM policy should:
 - (1) reflect the shared responsibility of management, flight and cabin crew, and other involved personnel;
 - (2) state the safety objectives of FRM;
 - (3) be signed by the accountable manager;
 - (4) be communicated, with visible endorsement, to all the relevant areas and levels of the organisation;
 - (5) declare management commitment to effective safety reporting;
 - (6) declare management commitment to the provision of adequate resources for FRM;
 - (7) declare management commitment to continuous improvement of FRM;
 - (8) require that clear lines of accountability for management, flight and cabin crew, and all other involved personnel are identified; and
 - (9) require periodic reviews to ensure it remains relevant and appropriate.

AMC1 ORO.FTL.120(b)(2) Fatigue risk management (FRM)

Reserved

AMC2 ORO.FTL.120(b)(2) Fatigue risk management (FRM)

ED Decision 2014/017/R

CAT OPERATORS FRM DOCUMENTATION

The operator should develop and keep current FRM documentation that describes and records:

- (1) FRM policy and objectives;
- (2) FRM processes and procedures;
- (3) accountabilities, responsibilities and authorities for these processes and procedures;
- (4) mechanisms for on-going involvement of management, flight and cabin crew members, and all other involved personnel;

- (5) FRM training programmes, training requirements and attendance records;
- (6) scheduled and actual flight times, duty periods and rest periods with deviations and reasons for deviations; and
- (7) FRM outputs including findings from collected data, recommendations, and actions taken.

GM1 ORO.FTL.120(b)(3) Fatigue risk management (FRM)

ED Decision 2017/007/R

SCIENTIFIC METHOD

‘Scientific method’ is defined as ‘a method or procedure that has characterized natural science since the 17th century, consisting in systematic observation, measurement, and experiment, and the formulation, testing, and modification of hypotheses’.

A scientific study may be required as an element of proactive fatigue hazard identification. Such a study should be based on scientific principles, i.e. use the scientific method. That means that the study should consist of the following elements as applicable to each individual case:

- (a) an introduction with a summary and the description of the study design, methods and results;
- (b) a statement of the hypothesis being tested, how it is being tested and a conclusion as to whether the hypothesis was found to be true or not;
- (c) a description of the data collection method and tools, e.g. the sensitivity of the activity monitors, further information on any model and its limitations and how it is being used as part of the study;
- (d) a description of how the study subjects were selected and how representative of the crew member population the study group is;
- (e) a description of the rosters the study participants have worked containing data such as e.g. flight and duty hours, number of sectors, duty start/finish times;
- (f) reports on mean sleep duration and efficiency and data for other standard measures (e.g. sleep timing, self-rated sleepiness/fatigue, sources of sleep disruption, performance, safety);
- (g) a description of how sleep and the other measures varied across the roster (i.e. day-to-day) and where and why minimum sleep occurred;
- (h) statistical data analysis to test the hypothesis; and
- (i) the explanation of how the study results have been used to influence the design of the roster or other fatigue mitigations.

AMC1 ORO.FTL.120(b)(4) Fatigue risk management (FRM)

ED Decision 2015/005/R

CAT OPERATORS IDENTIFICATION OF HAZARDS

The operator should develop and maintain three documented processes for fatigue hazard identification:

- (a) Predictive

The predictive process should identify fatigue hazards by examining crew scheduling and taking into account factors known to affect sleep and fatigue and their effects on performance. Methods of examination may include, but are not limited to:

- (1) operator or industry operational experience and data collected on similar types of operations;
 - (2) evidence-based scheduling practices; and
 - (3) bio-mathematical models.
- (b) Proactive
- The proactive process should identify fatigue hazards within current flight operations. Methods of examination may include, but are not limited to:
- (1) self-reporting of fatigue risks;
 - (2) crew fatigue surveys;
 - (3) relevant flight and cabin crew performance data;
 - (4) available safety databases and scientific studies; and
 - (5) analysis of planned versus actual time worked.
- (c) Reactive
- The reactive process should identify the contribution of fatigue hazards to reports and events associated with potential negative safety consequences in order to determine how the impact of fatigue could have been minimised. At a minimum, the process may be triggered by any of the following:
- (1) fatigue reports;
 - (2) confidential reports;
 - (3) audit reports;
 - (4) incidents; or
 - (5) flight data monitoring (FDM) events.

AMC2 ORO.FTL.120(b)(4) Fatigue risk management (FRM)

ED Decision 2014/017/R

CAT OPERATORS RISK ASSESSMENT

An operator should develop and implement risk assessment procedures that determine the probability and potential severity of fatigue-related events and identify when the associated risks require mitigation. The risk assessment procedures should review identified hazards and link them to:

- (a) operational processes;
- (b) their probability;
- (c) possible consequences; and
- (d) the effectiveness of existing safety barriers and controls.

AMC1 ORO.FTL.120(b)(5) Fatigue risk management (FRM)

ED Decision 2014/017/R

CAT OPERATORS RISK MITIGATION

An operator should develop and implement risk mitigation procedures that:

- (a) select the appropriate mitigation strategies;
- (b) implement the mitigation strategies; and
- (c) monitor the strategies' implementation and effectiveness.

AMC1 ORO.FTL.120(b)(6) Fatigue risk management (FRM)

ED Decision 2015/005/R

CAT OPERATORS FRM SAFETY ASSURANCE PROCESSES

The operator should develop and maintain FRM safety assurance processes to:

- (a) provide for continuous FRM performance monitoring, analysis of trends, and measurement to validate the effectiveness of the fatigue safety risk controls. The sources of data may include, but are not limited to:
 - (1) hazard reporting and investigations;
 - (2) audits and surveys; and
 - (3) reviews and fatigue studies;
- (b) provide a formal process for the management of change which should include, but is not limited to:
 - (1) identification of changes in the operational environment that may affect FRM;
 - (2) identification of changes within the organisation that may affect FRM; and
 - (3) consideration of available tools which could be used to maintain or improve FRM performance prior to implementing changes; and
- (c) provide for the continuous improvement of FRM. This should include, but is not limited to:
 - (1) the elimination and/or modification of risk controls have had unintended consequences or that are no longer needed due to changes in the operational or organisational environment;
 - (2) routine evaluations of facilities, equipment, documentation and procedures; and
 - (3) the determination of the need to introduce new processes and procedures to mitigate emerging fatigue-related risks.

AMC1 ORO.FTL.120(b)(7) Fatigue risk management (FRM)

ED Decision 2015/005/R

CAT OPERATORS FRM PROMOTION PROCESS

FRM promotion processes should support the on-going development of FRM, the continuous improvement of its overall performance, and attainment of optimum safety levels.

The following should be established and implemented by the operator as part of its FRM:

- (a) training programmes to ensure competency commensurate with the roles and responsibilities of management, flight and cabin crew, and all other involved personnel under the planned FRM; and
- (b) an effective FRM communication plan that:
 - (1) explains FRM policies, procedures and responsibilities to all relevant stakeholders; and
 - (2) describes communication channels used to gather and disseminate FRM-related information.

ORO.FTL.125 Flight time specification schemes

Regulation (EU) No 83/2014

- (a) Operators shall establish, implement and maintain flight time specification schemes that are appropriate for the type(s) of operation performed and that comply with Regulation (EC) No 216/2008, this Subpart and other applicable legislation, including Directive 2000/79/EC.
- (b) Before being implemented, flight time specification schemes, including any related FRM where required, shall be approved by the competent authority.
- (c) To demonstrate compliance with Regulation (EC) No 216/2008 and this Subpart, the operator shall apply the applicable certification specifications adopted by the Agency. Alternatively, if the operator wants to deviate from those certification specifications in accordance with Article 22(2) of Regulation (EC) No 216/2008, it shall provide the competent authority with a full description of the intended deviation prior to implementing it. The description shall include any revisions to manuals or procedures that may be relevant, as well as an assessment demonstrating that the requirements of Regulation (EC) No 216/2008 and of this Subpart are met.
- (d) For the purpose of point [ARO.OPS.235\(d\)](#), within 2 years of the implementation of a deviation or derogation, the operator shall collect data concerning the granted deviation or derogation and analyse that data using scientific principles with a view to assessing the effects of the deviation or derogation on aircrew fatigue. Such analysis shall be provided in the form of a report to the competent authority.

SECTION 2 – COMMERCIAL AIR TRANSPORT OPERATORS

ORO.FTL.200 Home base

Regulation (EU) No 83/2014

An operator shall assign a home base to each crew member.

ORO.FTL.205 Flight duty period (FDP)

Regulation (EU) No 83/2014

- (a) The operator shall:
 - (1) define reporting times appropriate to each individual operation taking into account [ORO.FTL.110\(c\)](#);

- (2) establish procedures specifying how the commander shall, in case of special circumstances which could lead to severe fatigue, and after consultation with the crew members concerned, reduce the actual FDP and/or increase the rest period in order to eliminate any detrimental effect on flight safety.
- (b) Basic maximum daily FDP.
- (1) The maximum daily FDP without the use of extensions for acclimatised crew members shall be in accordance with the following table:

Table 2

Maximum daily FDP — Acclimatised crew members

Start of FDP at reference time	1–2 Sectors	3 Sectors	4 Sectors	5 Sectors	6 Sectors	7 Sectors	8 Sectors	9 Sectors	10 Sectors
0600–1329	13:00	12:30	12:00	11:30	11:00	10:30	10:00	09:30	09:00
1330–1359	12:45	12:15	11:45	11:15	10:45	10:15	09:45	09:15	09:00
1400–1429	12:30	12:00	11:30	11:00	10:30	10:00	09:30	09:00	09:00
1430–1459	12:15	11:45	11:15	10:45	10:15	09:45	09:15	09:00	09:00
1500–1529	12:00	11:30	11:00	10:30	10:00	09:30	09:00	09:00	09:00
1530–1559	11:45	11:15	10:45	10:15	09:45	09:15	09:00	09:00	09:00
1600–1629	11:30	11:00	10:30	10:00	09:30	09:00	09:00	09:00	09:00
1630–1659	11:15	10:45	10:15	09:45	09:15	09:00	09:00	09:00	09:00
1700–0459	11:00	10:30	10:00	09:30	09:00	09:00	09:00	09:00	09:00
0500–0514	12:00	11:30	11:00	10:30	10:00	09:30	09:00	09:00	09:00
0515–0529	12:15	11:45	11:15	10:45	10:15	09:45	09:15	09:00	09:00
0530–0544	12:30	12:00	11:30	11:00	10:30	10:00	09:30	09:00	09:00
0545–0559	12:45	12:15	11:45	11:15	10:45	10:15	09:45	09:15	09:00

- (2) The maximum daily FDP when crew members are in an unknown state of acclimatisation shall be in accordance with the following table:

Table 3

Crew members in an unknown state of acclimatisation

Maximum daily FDP according to sectors						
1–2	3	4	5	6	7	8
11:00	10:30	10:00	09:30	09:00	09:00	09:00

- (3) The maximum daily FDP when crew members are in an unknown state of acclimatisation and the operator has implemented a FRM, shall be in accordance with the following table:

Table 4

Crew members in an unknown state of acclimatisation under FRM

The values in the following table may apply provided the operator's FRM continuously monitors that the required safety performance is maintained.

Maximum daily FDP according to sectors						
1–2	3	4	5	6	7	8
12:00	11:30	11:00	10:30	10:00	09:30	09:00

- (c) FDP with different reporting time for flight crew and cabin crew.

Whenever cabin crew requires more time than the flight crew for their pre-flight briefing for the same sector or series of sectors, the FDP of the cabin crew may be extended by the difference in reporting time between the cabin crew and the flight crew. The difference shall not exceed 1 hour. The maximum daily FDP for cabin crew shall be based on the time at which the flight crew report for their FDP, but the FDP shall start at the reporting time of the cabin crew.

- (d) Maximum daily FDP for acclimatised crew members with the use of extensions without in-flight rest.

- (1) The maximum daily FDP may be extended by up to 1 hour not more than twice in any 7 consecutive days. In that case:
 - (i) the minimum pre-flight and post-flight rest periods shall be increased by 2 hours; or
 - (ii) the post-flight rest period shall be increased by 4 hours.
- (2) When extensions are used for consecutive FDPs, the additional pre- and post-flight rest between the two extended FDPs required under subparagraph 1 shall be provided consecutively.
- (3) The use of the extension shall be planned in advance, and shall be limited to a maximum of:
 - (i) 5 sectors when the WOCL is not encroached; or
 - (ii) 4 sectors, when the WOCL is encroached by 2 hours or less; or
 - (iii) 2 sectors, when the WOCL is encroached by more than 2 hours.
- (4) Extension of the maximum basic daily FDP without in-flight rest shall not be combined with extensions due to in-flight rest or split duty in the same duty period.
- (5) Flight time specification schemes shall specify the limits for extensions of the maximum basic daily FDP in accordance with the certification specifications applicable to the type of operation, taking into account:
 - (i) the number of sectors flown; and
 - (ii) WOCL encroachment.

- (e) Maximum daily FDP with the use of extensions due to in-flight rest

Flight time specification schemes shall specify the conditions for extensions of the maximum basic daily FDP with in-flight rest in accordance with the certification specifications applicable to the type of operation, taking into account:

- (i) the number of sectors flown;
- (ii) the minimum in-flight rest allocated to each crew member;
- (iii) the type of in-flight rest facilities; and
- (iv) the augmentation of the basic flight crew.

- (f) Unforeseen circumstances in flight operations — commander's discretion
- (1) The conditions to modify the limits on flight duty, duty and rest periods by the commander in the case of unforeseen circumstances in flight operations, which start at or after the reporting time, shall comply with the following:
 - (i) the maximum daily FDP which results after applying points (b) and (e) of point ORO.FTL.205 or point ORO.FTL.220 may not be increased by more than 2 hours unless the flight crew has been augmented, in which case the maximum flight duty period may be increased by not more than 3 hours;
 - (ii) if on the final sector within an FDP the allowed increase is exceeded because of unforeseen circumstances after take-off, the flight may continue to the planned destination or alternate aerodrome; and
 - (iii) the rest period following the FDP may be reduced but can never be less than 10 hours.
 - (2) In case of unforeseen circumstances which could lead to severe fatigue, the commander shall reduce the actual flight duty period and/or increase the rest period in order to eliminate any detrimental effect on flight safety.
 - (3) The commander shall consult all crew members on their alertness levels before deciding the modifications under subparagraphs 1 and 2.
 - (4) The commander shall submit a report to the operator when an FDP is increased or a rest period is reduced at his or her discretion.
 - (5) Where the increase of an FDP or reduction of a rest period exceeds 1 hour, a copy of the report, to which the operator shall add its comments, shall be sent by the operator to the competent authority not later than 28 days after the event.
 - (6) The operator shall implement a non-punitive process for the use of the discretion described under this provision and shall describe it in the operations manual.
- (g) Unforeseen circumstances in flight operations — delayed reporting
- The operator shall establish procedures, in the operations manual, for delayed reporting in the event of unforeseen circumstances, in accordance with the certification specifications applicable to the type of operation.

GM1 ORO.FTL.205(a)(1) Flight Duty Period (FDP)

ED Decision 2014/017/R

REPORTING TIMES

The operator should specify reporting times taking into account the type of operation, the size and type of aircraft and the reporting airport conditions.

GM1 ORO.FTL.205(b)(1) Flight duty period (FDP)

ED Decision 2014/017/R

REFERENCE TIME

The start time of the FDP in the table refers to the 'reference time'. That means, to the local time of the point of departure, if this point of departure is within a 2-hour wide time zone band around the local time where a crew member is acclimatised.

AMC1 ORO.FTL.205(f) Flight Duty Period (FDP)

ED Decision 2014/017/R

UNFORESEEN CIRCUMSTANCES IN ACTUAL FLIGHT OPERATIONS — COMMANDER'S DISCRETION

- (a) As general guidance when developing a commander's discretion policy, the operator should take into consideration the shared responsibility of management, flight and cabin crew in the case of unforeseen circumstances. The exercise of commander's discretion should be considered exceptional and should be avoided at home base and/or company hubs where standby or reserve crew members should be available. Operators should assess on a regular basis the series of pairings where commander's discretion has been exercised in order to be aware of possible inconsistencies in their rostering.
- (b) The operator's policy on commander's discretion should state the safety objectives, especially in the case of an extended FDP or reduced rest and should take due consideration of additional factors that might decrease a crew member's alertness levels, such as:
- (1) WOCL encroachment;
 - (2) weather conditions;
 - (3) complexity of the operation and/or airport environment;
 - (4) aeroplane malfunctions or specifications;
 - (5) flight with training or supervisory duties;
 - (6) increased number of sectors;
 - (7) circadian disruption; and
 - (8) individual conditions of affected crew members (time since awake, sleep-related factor, workload, etc.).

GM1 ORO.FTL.205(f)(1)(i) Flight Duty Period (FDP)

ED Decision 2014/017/R

COMMANDER'S DISCRETION

The maximum basic daily FDP that results after applying [ORO.FTL.205\(b\)](#) should be used to calculate the limits of commander's discretion, if commander's discretion is applied to an FDP which has been extended under the provisions of ORO.FTL.205(d).

ORO.FTL.210 Flight times and duty periods

Regulation (EU) No 83/2014

- (a) The total duty periods to which a crew member may be assigned shall not exceed:
- (1) 60 duty hours in any 7 consecutive days;
 - (2) 110 duty hours in any 14 consecutive days; and
 - (3) 190 duty hours in any 28 consecutive days, spread as evenly as practicable throughout that period.
- (b) The total flight time of the sectors on which an individual crew member is assigned as an operating crew member shall not exceed:
- (1) 100 hours of flight time in any 28 consecutive days;

- (2) 900 hours of flight time in any calendar year; and
- (3) 1 000 hours of flight time in any 12 consecutive calendar months.
- (c) Post-flight duty shall count as duty period. The operator shall specify in its operations manual the minimum time period for post-flight duties.

AMC1 ORO.FTL.210(c) Flight times and duty periods

ED Decision 2014/017/R

POST-FLIGHT DUTIES

The operator should specify post-flight duty times taking into account the type of operation, the size and type of aircraft and the airport conditions.

ORO.FTL.215 Positioning

Regulation (EU) No 83/2014

If an operator positions a crew member, the following shall apply:

- (a) positioning after reporting but prior to operating shall be counted as FDP but shall not count as a sector;
- (b) all time spent on positioning shall count as duty period.

ORO.FTL.220 Split duty

Regulation (EU) No 83/2014

The conditions for extending the basic maximum daily FDP due to a break on the ground shall be in accordance with the following:

- (a) flight time specification schemes shall specify the following elements for split duty in accordance with the certification specifications applicable to the type of operation:
 - (1) the minimum duration of a break on the ground; and
 - (2) the possibility to extend the FDP prescribed under point [ORO.FTL.205\(b\)](#) taking into account the duration of the break on the ground, the facilities provided to the crew member to rest and other relevant factors;
- (b) the break on the ground shall count in full as FDP;
- (c) split duty shall not follow a reduced rest.

ORO.FTL.225 Standby and duties at the airport

Regulation (EU) No 83/2014

If an operator assigns crew members to standby or to any duty at the airport, the following shall apply in accordance with the certification specifications applicable to the type of operation:

- (a) standby and any duty at the airport shall be in the roster and the start and end time of standby shall be defined and notified in advance to the crew members concerned to provide them with the opportunity to plan adequate rest;
- (b) a crew member is considered on airport standby from reporting at the reporting point until the end of the notified airport standby period;

- (c) airport standby shall count in full as duty period for the purpose of points [ORO.FTL.210](#) and [ORO.FTL.235](#);
- (d) any duty at the airport shall count in full as duty period and the FDP shall count in full from the airport duty reporting time;
- (e) the operator shall provide accommodation to the crew member on airport standby;
- (f) flight time specification schemes shall specify the following elements:
 - (1) the maximum duration of any standby;
 - (2) the impact of the time spent on standby on the maximum FDP that may be assigned, taking into account facilities provided to the crew member to rest, and other relevant factors such as:
 - the need for immediate readiness of the crew member,
 - the interference of standby with sleep, and
 - sufficient notification to protect a sleep opportunity between the call for duty and the assigned FDP;
 - (3) the minimum rest period following standby which does not lead to assignment of an FDP;
 - (4) how time spent on standby other than airport standby shall be counted for the purpose of cumulative duty periods.

ORO.FTL.230 Reserve

Regulation (EU) No 83/2014

If an operator assigns crew members to reserve, the following requirements shall apply in accordance with the certification specifications applicable to the type of operation:

- (a) reserve shall be in the roster;
- (b) flight time specification schemes shall specify the following elements:
 - (1) the maximum duration of any single reserve period;
 - (2) the number of consecutive reserve days that may be assigned to a crew member.

GM1 ORO.FTL.230(a) Reserve

ED Decision 2014/017/R

ROSTERING OF RESERVE

Including reserve in a roster, also referred to as 'rostering', implies that a reserve period that does not result in a duty period may not retrospectively be considered as part of a recurrent extended recovery rest period.

ORO.FTL.235 Rest periods

Regulation (EU) No 83/2014

- (a) Minimum rest period at home base.
 - (1) The minimum rest period provided before undertaking an FDP starting at home base shall be at least as long as the preceding duty period, or 12 hours, whichever is greater.

- (2) By way of derogation from point (1), the minimum rest provided under point (b) applies if the operator provides suitable accommodation to the crew member at home base.
- (b) Minimum rest period away from home base.
- The minimum rest period provided before undertaking an FDP starting away from home base shall be at least as long as the preceding duty period, or 10 hours, whichever is greater. This period shall include an 8-hour sleep opportunity in addition to the time for travelling and physiological needs.
- (c) Reduced rest
- By derogation from points (a) and (b), flight time specification schemes may reduce the minimum rest periods in accordance with the certification specifications applicable to the type of operation and taking into account the following elements:
- (1) the minimum reduced rest period;
 - (2) the increase of the subsequent rest period; and
 - (3) the reduction of the FDP following the reduced rest.
- (d) Recurrent extended recovery rest periods
- Flight time specification schemes shall specify recurrent extended recovery rest periods to compensate for cumulative fatigue. The minimum recurrent extended recovery rest period shall be 36 hours, including 2 local nights, and in any case the time between the end of one recurrent extended recovery rest period and the start of the next extended recovery rest period shall not be more than 168 hours. The recurrent extended recovery rest period shall be increased to 2 local days twice every month.
- (e) Flight time specification schemes shall specify additional rest periods in accordance with the applicable certification specifications to compensate for:
- (1) the effects of time zone differences and extensions of the FDP;
 - (2) additional cumulative fatigue due to disruptive schedules; and
 - (3) a change of home base.

GM1 ORO.FTL.235(a)(2) Rest periods

ED Decision 2014/017/R

MINIMUM REST PERIOD AT HOME BASE IF SUITABLE ACCOMMODATION IS PROVIDED

An operator may apply the minimum rest period away from home base during a rotation which includes a rest period at a crew member's home base. This applies only if the crew member does not rest at his/her residence, or temporary accommodation, because the operator provides suitable accommodation. This type of roster is known as "back-to-back operation".

AMC1 ORO.FTL.235(b) Rest periods

ED Decision 2014/017/R

MINIMUM REST PERIOD AWAY FROM HOME BASE

The time allowed for physiological needs should be 1 hour. Consequently, if the travelling time to the suitable accommodation is more than 30 minutes, the operator should increase the rest period by twice the amount of difference of travelling time above 30 minutes.

ORO.FTL.240 Nutrition

Regulation (EU) No 83/2014

- (a) During the FDP there shall be the opportunity for a meal and drink in order to avoid any detriment to a crew member's performance, especially when the FDP exceeds 6 hours.
- (b) An operator shall specify in its operations manual how the crew member's nutrition during FDP is ensured.

AMC1 ORO.FTL.240 Nutrition

ED Decision 2014/017/R

MEAL OPPORTUNITY

- (a) The operations manual should specify the minimum duration of the meal opportunity, when a meal opportunity is provided, in particular when the FDP encompasses the regular meal windows (e.g. if the FDP starts at 11:00 hours and ends at 22:00 hours meal opportunities for two meals should be given).
- (b) It should define the time frames in which a regular meal should be consumed in order not to alter the human needs for nutrition without affecting the crew member's body rhythms.

ORO.FTL.245 Records of home base, flight times, duty and rest periods

Regulation (EU) No 83/2014

- (a) An operator shall maintain, for a period of 24 months:
 - (1) individual records for each crew member including:
 - (i) flight times;
 - (ii) start, duration and end of each duty period and FDP;
 - (iii) rest periods and days free of all duties; and
 - (iv) assigned home base;
 - (2) reports on extended flight duty periods and reduced rest periods.
- (b) Upon request, the operator shall provide copies of individual records of flight times, duty periods and rest periods to:
 - (1) the crew member concerned; and
 - (2) to another operator, in relation to a crew member who is or becomes a crew member of the operator concerned.
- (c) Records referred to in point [CAT.GEN.MPA.100\(b\)\(5\)](#) in relation to crew members who undertake duties for more than one operator shall be kept for a period of 24 months.

ORO.FTL.250 Fatigue management training

Regulation (EU) No 83/2014

- (a) The operator shall provide initial and recurrent fatigue management training to crew members, personnel responsible for preparation and maintenance of crew rosters and management personnel concerned.

- (b) This training shall follow a training programme established by the operator and described in the operations manual. The training syllabus shall cover the possible causes and effects of fatigue and fatigue countermeasure.

AMC1 ORO.FTL.250 Fatigue management training

ED Decision 2014/017/R

TRAINING SYLLABUS FATIGUE MANAGEMENT TRAINING

The training syllabus should contain the following:

- (a) applicable regulatory requirements for flight, duty and rest;
- (b) the basics of fatigue including sleep fundamentals and the effects of disturbing the circadian rhythms;
- (c) the causes of fatigue, including medical conditions that may lead to fatigue;
- (d) the effect of fatigue on performance;
- (e) fatigue countermeasures;
- (f) the influence of lifestyle, including nutrition, exercise, and family life, on fatigue;
- (g) familiarity with sleep disorders and their possible treatments;
- (h) where applicable, the effects of long range operations and heavy short range schedules on individuals;
- (i) the effect of operating through and within multiple time zones; and
- (j) the crew member responsibility for ensuring adequate rest and fitness for flight duty.

CERTIFICATION SPECIFICATIONS AND GUIDANCE MATERIAL FOR COMMERCIAL AIR TRANSPORT BY AEROPLANE — SCHEDULED AND CHARTER OPERATIONS

CS FTL.1.100 Applicability

ED Decision 2014/002/R

These Certification Specifications are applicable to commercial air transport by aeroplanes for scheduled and charter operations, excluding emergency medical service (EMS), air taxi and single pilot operations.

CS FTL.1.200 Home base

ED Decision 2014/002/R

- (a) The home base is a single airport location assigned with a high degree of permanence.
- (b) In the case of a change of home base, the first recurrent extended recovery rest period prior to starting duty at the new home base is increased to 72 hours, including 3 local nights. Travelling time between the former home base and the new home base is positioning.

GM1 CS FTL.1.200 Home base

ED Decision 2014/002/R

TRAVELLING TIME

Crew members should consider making arrangements for temporary accommodation closer to their home base if the travelling time from their residence to their home base usually exceeds 90 minutes.

CS FTL.1.205 Flight duty period (FDP)

ED Decision 2014/002/R

- (a) Night duties under the provisions of [ORO.FTL.205\(b\)](#) and (d) comply with the following:
- (1) When establishing the maximum FDP for consecutive night duties, the number of sectors is limited to 4 sectors per duty. (2) The operator applies appropriate fatigue risk management to actively manage the fatiguing effect of night duties of more than 10 hours in relation to the surrounding duties and rest periods.

- (b) Extension of FDP without in-flight rest

The extension of FDP without in-flight rest under the provisions of [ORO.FTL.205\(d\)\(5\)](#) is limited to the values specified in the table below.

Maximum daily FDP with extension

Starting time of FDP	1–2 sectors (in hours)	3 sectors (in hours)	4 sectors (in hours)	5 sectors (in hours)
0600–0614	Not allowed	Not allowed	Not allowed	Not allowed
0615–0629	13:15	12:45	12:15	11:45
0630–0644	13:30	13:00	12:30	12:00
0645–0659	13:45	13:15	12:45	12:15
0700–1329	14:00	13:30	13:00	12:30
1330–1359	13:45	13:15	12:45	Not allowed
1400–1429	13:30	13:00	12:30	Not allowed
1430–1459	13:15	12:45	12:15	Not allowed
1500–1529	13:00	12:30	12:00	Not allowed
1530–1559	12:45	Not allowed	Not allowed	Not allowed
1600–1629	12:30	Not allowed	Not allowed	Not allowed
1630–1659	12:15	Not allowed	Not allowed	Not allowed
1700–1729	12:00	Not allowed	Not allowed	Not allowed
1730–1759	11:45	Not allowed	Not allowed	Not allowed
1800–1829	11:30	Not allowed	Not allowed	Not allowed
1830–1859	11:15	Not allowed	Not allowed	Not allowed
1900–0359	Not allowed	Not allowed	Not allowed	Not allowed
0400–0414	Not allowed	Not allowed	Not allowed	Not allowed
0415–0429	Not allowed	Not allowed	Not allowed	Not allowed
0430–0444	Not allowed	Not allowed	Not allowed	Not allowed
0445–0459	Not allowed	Not allowed	Not allowed	Not allowed
0500–0514	Not allowed	Not allowed	Not allowed	Not allowed
0515–0529	Not allowed	Not allowed	Not allowed	Not allowed

0530–0544	Not allowed	Not allowed	Not allowed	Not allowed
0545–0559	Not allowed	Not allowed	Not allowed	Not allowed

(c) Extension of FDP due to in-flight rest

In-flight rest facilities in accordance with [ORO.FTL.205\(e\)\(iii\)](#) fulfil the following minimum standards:

- ‘Class 1 rest facility’ means a bunk or other surface that allows for a flat or near flat sleeping position. It reclines to at least 80° back angle to the vertical and is located separately from both the flight crew compartment and the passenger cabin in an area that allows the crew member to control light, and provides isolation from noise and disturbance;
- ‘Class 2 rest facility’ means a seat in an aircraft cabin that reclines at least 45° back angle to the vertical, has at least a pitch of 55 inches (137,5 cm), a seat width of at least 20 inches (50 cm) and provides leg and foot support. It is separated from passengers by at least a curtain to provide darkness and some sound mitigation, and is reasonably free from disturbance by passengers or crew members;
- ‘Class 3 rest facility’ means a seat in an aircraft cabin or flight crew compartment that reclines at least 40° from the vertical, provides leg and foot support and is separated from passengers by at least a curtain to provide darkness and some sound mitigation, and is not adjacent to any seat occupied by passengers.

(1) The extension of FDP with in-flight rest under the provisions of [ORO.FTL.205\(e\)](#) complies with the following:

- (i) the FDP is limited to 3 sectors; and
- (ii) the minimum in-flight rest period is a consecutive 90-minute period for each crew member and 2 consecutive hours for the flight crew members at control during landing.

(2) The maximum daily FDP under the provisions of [ORO.FTL.205\(e\)](#) may be extended due to in-flight rest for flight crew:

- (i) with one additional flight crew member:
 - (A) up to 14 hours with class 3 rest facilities;
 - (B) up to 15 hours with class 2 rest facilities; or
 - (C) up to 16 hours with class 1 rest facilities;
- (ii) with two additional flight crew members:
 - (A) up to 15 hours with class 3 rest facilities;
 - (B) up to 16 hours with class 2 rest facilities; or
 - (C) up to 17 hours with class 1 rest facilities.

- (3) The minimum in-flight rest for each cabin crew member is:

Maximum extended FDP	Minimum in-flight rest (in hours)		
	Class 1	Class 2	Class 3
up to 14:30 hrs	1:30	1:30	1:30
14:31 – 15:00 hrs	1:45	2:00	2:20
15:01 – 15:30 hrs	2:00	2:20	2:40
15:31 – 16:00 hrs	2:15	2:40	3:00
16:01 – 16:30 hrs	2:35	3:00	Not allowed
16:31 – 17:00 hrs	3:00	3:25	Not allowed
17:01 – 17:30 hrs	3:25	Not allowed	Not allowed
17:31 – 18:00 hrs	3:50	Not allowed	Not allowed

- (4) The limits specified in (2) may be increased by 1 hour for FDPs that include 1 sector of more than 9 hours of continuous flight time and a maximum of 2 sectors.
- (5) All time spent in the rest facility is counted as FDP.
- (6) The minimum rest at destination is at least as long as the preceding duty period, or 14 hours, whichever is greater.
- (7) A crew member does not start a positioning sector to become part of this operating crew on the same flight.
- (d) Unforeseen circumstances in flight operations — delayed reporting
- (1) The operator may delay the reporting time in the event of unforeseen circumstances, if procedures for delayed reporting are established in the operations manual. The operator keeps records of delayed reporting. Delayed reporting procedures establish a notification time allowing a crew member to remain in his/her suitable accommodation when the delayed reporting procedure is activated. In such a case, if the crew member is informed of the delayed reporting time, the FDP is calculated as follows:
- (i) one notification of a delay leads to the calculation of the maximum FDP according to (iii) or (iv);
 - (ii) if the reporting time is further amended, the FDP starts counting 1 hour after the second notification or at the original delayed reporting time if this is earlier;
 - (iii) when the delay is less than 4 hours, the maximum FDP is calculated based on the original reporting time and the FDP starts counting at the delayed reporting time;
 - (iv) when the delay is 4 hours or more, the maximum FDP is calculated based on the more limiting of the original or the delayed reporting time and the FDP starts counting at the delayed reporting time;
 - (v) as an exception to (i) and (ii), when the operator informs the crew member of a delay of 10 hours or more in reporting time and the crew member is not further disturbed by the operator, such delay of 10 hours or more counts as a rest period.

GM1 CS FTL.1.205(a)(2) Flight duty period (FDP)

ED Decision 2014/002/R

NIGHT DUTIES – APPROPRIATE FATIGUE RISK MANAGEMENT

- (a) When rostering night duties of more than 10 hours (referred to below as ‘long night duties’), it is critical for the crew member to obtain sufficient sleep before such duties when he/she is adapted to being awake during day time hours at the local time where he/she is acclimatised. To optimise alertness on long night duties, the likelihood of obtaining sleep as close as possible to the start of the FDP should be considered, when rostering rest periods before long night duties, by providing sufficient time to the crew member to adapt to being awake during the night. Rostering practices leading to extended wakefulness before reporting for such duties should be avoided. Fatigue risk management principles that could be applied to the rostering of long night duties may include:
- (1) avoiding long night duties after extended recovery rest periods
 - (2) progressively delaying the rostered ending time of the FDPs preceding long night duties;
 - (3) starting a block of night duties with a shorter FDP; and
 - (4) avoiding the sequence of early starts and long night duties.
- (b) Fatigue risk management principles may be applied to the rostering of long night duties by means of:
- (1) considering operator or industry operational experience and data collected on similar operations;
 - (2) evidence-based scheduling practices; and
 - (3) bio-mathematical models.

GM1 CS FTL.1.205(c)(1)(ii) Flight Duty Period (FDP)

ED Decision 2014/002/R

IN-FLIGHT REST

In-flight rest should be taken during the cruise phase of the flight.

GM2 CS FTL.1.205(c)(1)(ii) Flight Duty Period (FDP)

ED Decision 2014/002/R

IN-FLIGHT REST

In-flight rest periods should be allocated in order to optimise the alertness of those flight crew members at control during landing.

GM1 CS FTL.1.205(d) Flight Duty Period (FDP)

ED Decision 2014/002/R

DELAYED REPORTING

Operator procedures for delayed reporting should:

- (a) specify a contacting mode;
- (b) establish minimum and maximum notification times; and

- (c) avoid interference with sleeping patterns when possible.

CS FTL.1.220 Split duty

ED Decision 2014/002/R

The increase of limits on flight duty, under the provisions of [ORO.FTL.220](#), complies with the following:

- (a) The break on the ground within the FDP has a minimum duration of 3 consecutive hours.
- (b) The break excludes the time allowed for post and pre-flight duties and travelling. The minimum total time for post and pre-flight duties and travelling is 30 minutes. The operator specifies the actual times in its operations manual.
- (c) The maximum FDP specified in [ORO.FTL.205\(b\)](#) may be increased by up to 50 % of the break.
- (d) Suitable accommodation is provided either for a break of 6 hours or more or for a break that encroaches the window of circadian low (WOCL).
- (e) In all other cases:
 - (1) accommodation is provided; and
 - (2) any time of the actual break exceeding 6 hours or any time of the break that encroaches the WOCL does not count for the extension of the FDP.
- (f) Split duty cannot be combined with in-flight rest.

GM1 CS FTL.1.220(b) Split duty

ED Decision 2014/002/R

POST, PRE-FLIGHT DUTY AND TRAVELLING TIMES

The operator should specify post and pre-flight duty and travelling times taking into account aircraft type, type of operation and airport conditions.

CS FTL.1.225 Standby

ED Decision 2014/002/R

The modification of limits on flight duty, duty and rest periods under the provisions of [ORO.FTL.225](#) complies with the following:

- (a) Airport standby
 - (1) If not leading to the assignment of an FDP, airport standby is followed by a rest period as specified in [ORO.FTL.235](#).
 - (2) If an assigned FDP starts during airport standby, the following applies:
 - (i) the FDP counts from the start of the FDP. The maximum FDP is reduced by any time spent on standby in excess of 4 hours;
 - (ii) the maximum combined duration of airport standby and assigned FDP as specified in [ORO.FTL.205\(b\)](#) and (d) is 16 hours.
- (b) Standby other than airport standby:
 - (1) the maximum duration of standby other than airport standby is 16 hours;
 - (2) The operator's standby procedures are designed to ensure that the combination of standby and FDP do not lead to more than 18 hours awake time;

- (3) 25 % of time spent on standby other than airport standby counts as duty time for the purpose of [ORO.FTL.210](#);
- (4) standby is followed by a rest period in accordance with [ORO.FTL.235](#);
- (5) standby ceases when the crew member reports at the designated reporting point;
- (6) if standby ceases within the first 6 hours, the maximum FDP counts from reporting;
- (7) if standby ceases after the first 6 hours, the maximum FDP is reduced by the amount of standby time exceeding 6 hours;
- (8) if the FDP is extended due to in-flight rest according to [CS FTL.1.205\(c\)](#), or to split duty according to [CS FTL.1.220](#), the 6 hours of paragraph (6) and (7) are extended to 8 hours;
- (9) if standby starts between 23:00 and 07:00, the time between 23:00 and 07:00 does not count towards the reduction of the FDP under (6), (7) and (8) until the crew member is contacted by the operator; and
- (10) the response time between call and reporting time established by the operator allows the crew member to arrive from his/her place of rest to the designated reporting point within a reasonable time.

GM1 CS FTL.1.225 Standby

ED Decision 2014/002/R

MINIMUM REST AND STANDBY

- (a) If airport or other standby initially assigned is reduced by the operator during standby that does not lead to an assignment to a flight duty period, the minimum rest requirements specified in [ORO.FTL.235](#) should apply.
- (b) If a minimum rest period as specified in [ORO.FTL.235](#) is provided before reporting for the duty assigned during the standby, this time period should not count as standby duty.
- (c) Standby other than airport standby counts (partly) as duty for the purpose of [ORO.FTL.210](#) only. If a crew member receives an assignment during standby other than airport standby, the actual reporting time at the designated reporting point should be used for the purpose of [ORO.FTL.235](#).

GM1 CS FTL.1.225(b) Standby

ED Decision 2014/002/R

STANDBY OTHER THAN AIRPORT STANDBY NOTIFICATION

Operator procedures for the notification of assigned duties during standby other than airport standby should avoid interference with sleeping patterns if possible.

GM1 CS FTL.1.225(b)(2) Standby

ED Decision 2014/002/R

AWAKE TIME

Scientific research shows that continuous awake in excess of 18 hours can reduce the alertness and should be avoided.

CS FTL.1.230 Reserve

ED Decision 2014/002/R

The operator assigns duties to a crew member on reserve under the provisions of [ORO.FTL.230](#) complying with the following:

- (a) An assigned FDP counts from the reporting time.
- (b) Reserve times do not count as duty period for the purpose of [ORO.FTL.210](#) and [ORO.FTL.235](#).
- (c) The operator defines the maximum number of consecutive reserve days within the limits of [ORO.FTL.235\(d\)](#).
- (d) To protect an 8-hour sleep opportunity, the operator rosters a period of 8 hours, taking into account fatigue management principles, for each reserve day during which a crew member on reserve is not contacted by the operator.

GM1 CS FTL.1.230 Reserve

ED Decision 2014/002/R

RESERVE NOTIFICATION

Operator procedures for the notification of assigned duties during reserve should avoid interference with sleeping patterns if possible.

GM2 CS FTL.1.230 Reserve

ED Decision 2014/002/R

NOTIFICATION IN ADVANCE

The minimum 'at least 10 hours' between the notification of an assignment for any duty and reporting for that duty during reserve may include the period of 8 hours during which a crew member on reserve is not contacted by the operator.

GM1 CS FTL.1.230(c) Reserve

ED Decision 2014/002/R

RECURRENT EXTENDED RECOVERY REST

[ORO.FTL.235\(d\)](#) applies to a crew member on reserve.

CS FTL.1.235 Rest periods

ED Decision 2014/002/R

- (a) Disruptive schedules
 - (1) If a transition from a late finish/night duty to an early start is planned at home base, the rest period between the 2 FDPs includes 1 local night.
 - (2) If a crew member performs 4 or more night duties, early starts or late finishes between 2 extended recovery rest periods as defined in [ORO.FTL.235\(d\)](#), the second extended recovery rest period is extended to 60 hours.
- (b) Time zone differences
 - (1) For the purpose of [ORO.FTL.235\(e\)\(1\)](#), 'rotation' is a series of duties, including at least one flight duty, and rest period out of home base, starting at home base and ending when

returning to home base for a rest period where the operator is no longer responsible for the accommodation of the crew member.

- (2) The operator monitors rotations and combinations of rotations in terms of their effect on crew member fatigue, and adapts the rosters as necessary.
- (3) Time zone differences are compensated by additional rest, as follows:
 - (i) At home base, if a rotation involves a 4 hour time difference or more, the minimum rest is as specified in the following table.

Minimum local nights of rest at home base to compensate for time zone differences

Maximum time difference (h) between reference time and local time where a crew member rests during a rotation	Time elapsed (h) since reporting for the first FDP in a rotation involving at least 4 hour time difference to the reference time			
	< 48	48 – 71:59	72 – 95:59	≥96
≤6	2	2	3	3
≤9	2	3	3	4
≤12	2	3	4	5

- (ii) Away from home base, if an FDP involves a 4-hour time difference or more, the minimum rest following that FDP is at least as long as the preceding duty period, or 14 hours, whichever is greater. By way of derogation from point (b)(3)(i) and only once between 2 recurrent extended recovery rest periods as specified in [ORO.FTL.235\(d\)](#), the minimum rest provided under this point (b)(3)(ii) may also apply to home base if the operator provides suitable accommodation to the crew member.
 - (4) In case of an Eastward-Westward or Westward-Eastward transition, at least 3 local nights of rest at home base are provided between alternating rotations.
 - (5) The monitoring of combinations of rotations is conducted under the operator's management system provisions.
- (c) Reduced rest
- (1) The minimum reduced rest periods under reduced rest arrangements are 12 hours at home base and 10 hours out of base.
 - (2) Reduced rest is used under fatigue risk management.
 - (3) The rest period following the reduced rest is extended by the difference between the minimum rest period specified in [ORO.FTL.235\(a\)](#) or (b) and the reduced rest.
 - (4) The FDP following the reduced rest is reduced by the difference between the minimum rest period specified in [ORO.FTL.235\(a\)](#) or (b) as applicable and the reduced rest.
 - (5) There is a maximum of 2 reduced rest periods between 2 recurrent extended recovery rest periods specified in accordance with [ORO.FTL.235\(d\)](#).

GM1 CS FTL.1.235(b)(3) Rest periods

ED Decision 2014/002/R

TIME ELAPSED SINCE REPORTING

The time elapsed since reporting for a rotation involving at least a 4-hour time difference to the reference time stops counting when the crew member returns to his/her home base for a rest period during which the operator is no longer responsible for the accommodation of the crew member.

GM2 CS FTL.1.235(b)(3) Additional rest to compensate for time zone differences

ED Decision 2017/007/R

REST AFTER ROTATIONS WITH THREE OR MORE FLIGHT DUTY PERIODS

For a rotation with three or more FDPs, the greatest time zone difference from the original reference time should be used to determine the minimum number of local nights of rest to compensate for time zone differences. If such a rotation includes time zones crossings in both directions, the calculation is based on the highest number of time zones crossed in any one FDP during the rotation.

<input type="checkbox"/>	The operator shall confirm that the information disclosed in this declaration is correct.
Date, name, and signature of the accountable manager	
(1)	If there is not enough space to list the required information in the declaration, the information shall be listed in a separate annex. The annex shall be dated and signed.
(2)	Manufacturer serial number.
(3)	If the aircraft is also registered with an AOC holder, specify the AOC number of the AOC holder.
(4)	'Type(s) of operation' refers to the type of operations conducted with this aircraft, e.g. non-commercial operations or specialised operations, e.g. aerial photography flights, aerial advertising flights, news media flights, television and movie flights, parachute operations, skydiving, maintenance check flights.
(5)	Information about the organisation responsible for the continuing airworthiness management shall include the name of the organisation, its address, and the approval reference.
(6)	<p>(a) operations with any defective instrument or piece of equipment or item or function, under a minimum equipment list (MEL) (points ORO.MLR.105 (b), (f), and (j), NCC.IDE.A.105, NCC.IDE.H.105, SPO.IDE.A.105, and SPO.IDE.H.105).</p> <p>(b) Operations requiring prior authorisation or approval, including all of the following:</p> <ul style="list-style-type: none"> — for specialised operations, wet lease-in and dry lease-in of aircraft registered in a third country (point ORO.SPO.100 (c)); — high-risk commercial specialised operations (point ORO.SPO.110); — non-commercial operations with aircraft with an MOPSC of more than 19, which are performed without — an operating cabin crew member (point ORO.CC.100 (d)); — use of IFR operating minima that are lower than those published by the State (points NCC.OP.110 and SPO.OP.110); — refuelling with engine(s) and/or rotors turning (point NCC.OP.157); — specialised operations (SPO) without oxygen above 10 000 ft (point SPO.OP.195).
(7)	Operations in accordance with Annex V (Part-SPA) to Regulation (EU) No 965/2012 , including Subparts B 'Performance based navigation (PBN) operations', C 'Operations with specified minimum navigation performance (MNPS)', D 'Operations in airspace with reduced vertical separation minima (RVSM)', E 'Low-visibility operations (LVOs) and operations with operational credits', G 'Transport of dangerous goods', K 'Helicopter offshore operations' and N 'Helicopter point-in-space approaches and departures with reduced VFR minima'.

ANNEX IV (PART-CAT)

SUBPART A: GENERAL REQUIREMENTS

CAT.GEN.100 Competent authority

Regulation (EU) No 965/2012

The competent authority shall be the authority designated by the Member State in which the operator has its principal place of business.

SECTION 1 – MOTOR-POWERED AIRCRAFT

CAT.GEN.MPA.100 Crew responsibilities

Regulation (EU) 2021/2037

- (a) The crew member shall be responsible for the proper execution of his or her duties that are:
 - (1) related to the safety of the aircraft and its occupants; and
 - (2) specified in the instructions and procedures in the operations manual.
- (b) The crew member shall:
 - (1) report to the commander any fault, failure, malfunction or defect which the crew member believes may affect the airworthiness or safe operation of the aircraft including emergency systems, if not already reported by another crew member;
 - (2) report to the commander any incident that endangered, or could have endangered, the safety of the operation, if not already reported by another crew member;
 - (3) comply with the relevant requirements of the operator's occurrence reporting schemes;
 - (4) comply with all flight and duty time limitations (FTL) and rest requirements applicable to their activities;
 - (5) when undertaking duties for more than one operator:
 - (i) maintain his or her individual records regarding flight and duty times and rest periods as referred to in the applicable FTL requirements;
 - (ii) provide each operator with the data needed to schedule activities in accordance with the applicable FTL requirements; and
 - (iii) provide each operator with the data needed regarding operations on more than one type or variant.
- (c) The crew member shall not perform duties on an aircraft:
 - (1) when under the influence of psychoactive substances or when unfit due to injury, fatigue, medication, sickness or other similar causes;
 - (2) until a reasonable time period has elapsed after deep water diving or following blood donation;
 - (3) if applicable medical requirements are not fulfilled;
 - (4) if he or she is in any doubt of being able to accomplish his or her assigned duties; or

- (5) if he or she knows or suspects that he or she is suffering from fatigue as referred to in Annex V, point 7.5, to [Regulation \(EU\) 2018/1139](#) or feels otherwise unfit, to the extent that the flight may be endangered.

AMC1 CAT.GEN.MPA.100(b) Crew responsibilities

ED Decision 2014/015/R

COPIES OF REPORTS

Where a written report is required, a copy of the report should be communicated to the commander concerned unless the terms of the operator's reporting schemes prevent this.

AMC1 CAT.GEN.MPA.100(c)(1) Crew responsibilities

ED Decision 2014/015/R

ALCOHOL CONSUMPTION

The operator should issue instructions concerning the consumption of alcohol by crew members. The instructions should be not less restrictive than the following:

- (a) no alcohol should be consumed less than 8 hours prior to the specified reporting time for a flight duty period or the commencement of standby;
- (b) the blood alcohol level should not exceed the lower of the national requirements or 0.2 per thousand at the start of a flight duty period;
- (c) no alcohol should be consumed during the flight duty period or whilst on standby.

GM1 CAT.GEN.MPA.100(c)(2) Crew responsibilities

ED Decision 2014/015/R

ELAPSED TIME BEFORE RETURNING TO FLYING DUTY

24 hours is a suitable minimum length of time to allow after normal blood donation or normal recreational (sport) diving before returning to flying duties. This should be considered by operators when determining a reasonable time period for the guidance of crew members.

PART-MED

Information on the effects of medication, drugs, other treatments and alcohol can be found in Annex IV (Part-MED) to Commission Regulation (EU) No 1178/2011¹.

CAT.GEN.MPA.105 Responsibilities of the commander

Regulation (EU) 2019/1384

- (a) The commander, in addition to complying with [CAT.GEN.MPA.100](#), shall:
 - (1) be responsible for the safety of all crew members, passengers and cargo on board, as soon as the commander arrives on board the aircraft, until the commander leaves the aircraft at the end of the flight;

¹ Commission Regulation (EU) No 1178/2011 of 3 November 2011 laying down technical requirements and administrative procedures related to civil aviation aircrew pursuant to Regulation (EC) No 216/2008 of the European Parliament and of the Council (OJ L 311, 25.11.2011, p. 1).

-
- (2) be responsible for the operation and safety of the aircraft:
 - (i) for aeroplanes, from the moment the aeroplane is first ready to move for the purpose of taxiing prior to take-off, until the moment it finally comes to rest at the end of the flight and the engine(s) used as primary propulsion unit(s) is(are) shut down;
 - (ii) for helicopters, when the rotors are turning;
 - (3) have authority to give all commands and take any appropriate actions for the purpose of securing the safety of the aircraft and of persons and/or property carried therein in accordance with 7.c of Annex IV to Regulation (EC) No 216/2008;
 - (4) have authority to disembark any person, or any part of the cargo, that may represent a potential hazard to the safety of the aircraft or its occupants;
 - (5) not allow a person to be carried in the aircraft who appears to be under the influence of alcohol or drugs to the extent that the safety of the aircraft or its occupants is likely to be endangered;
 - (6) have the right to refuse transportation of inadmissible passengers, deportees or persons in custody if their carriage increases the risk to the safety of the aircraft or its occupants;
 - (7) ensure that all passengers are briefed on the location of emergency exits and the location and use of relevant safety and emergency equipment;
 - (8) ensure that all operational procedures and checklists are complied with in accordance with the operations manual;
 - (9) not permit any crew member to perform any activity during critical phases of flight, except duties required for the safe operation of the aircraft;
 - (10) ensure that:
 - (i) flight recorders are not disabled or switched off during flight;
 - (ii) in the event of an occurrence other than an accident or a serious incident that shall be reported according to [ORO.GEN.160\(a\)](#), flight recorders' recordings are not intentionally erased; and
 - (iii) in the event of an accident or a serious incident, or if preservation of recordings of flight recorders is directed by the investigating authority:
 - (A) flight recorders' recordings are not intentionally erased;
 - (B) flight recorders are deactivated immediately after the flight is completed; and
 - (C) precautionary measures to preserve the recordings of flight recorders are taken before leaving the flight crew compartment;
 - (11) decide on acceptance of the aircraft with unserviceabilities in accordance with the configuration deviation list (CDL) or the minimum equipment list (MEL);
 - (12) ensure that the pre-flight inspection has been carried out in accordance with the requirements of Annex I (Part-M) to Regulation (EU) No 1321/2014;
 - (13) be satisfied that relevant emergency equipment remains easily accessible for immediate use;

- (14) record, at the termination of the flight, utilisation data and all known or suspected defects of the aircraft in the aircraft technical log or journey log of the aircraft to ensure continued flight safety.
- (b) The commander, or the pilot to whom conduct of the flight has been delegated, shall, in an emergency situation that requires immediate decision and action, take any action he/she considers necessary under the circumstances in accordance with 7.d of Annex IV to Regulation (EC) No 216/2008. In such cases he/she may deviate from rules, operational procedures and methods in the interest of safety.
- (c) Whenever an aircraft in flight has manoeuvred in response to an airborne collision avoidance system (ACAS) resolution advisory (RA), the commander shall submit an ACAS report to the competent authority.
- (d) Bird hazards and strikes:
 - (1) Whenever a potential bird hazard is observed, the commander shall inform the air traffic service (ATS) unit as soon as flight crew workload allows.
 - (2) Whenever an aircraft for which the commander is responsible suffers a bird strike that results in significant damage to the aircraft or the loss or malfunction of any essential service, the commander shall submit a written bird strike report after landing to the competent authority.
- (e) The commander shall, as soon as possible, report to the appropriate air traffic services (ATS) unit any hazardous weather or flight conditions encountered that are likely to affect the safety of other aircraft.

GM1 CAT.GEN.MPA.105(a)(10) Responsibilities of the commander

ED Decision 2015/030/R

IDENTIFICATION OF THE SEVERITY OF AN OCCURRENCE BY THE COMMANDER

The definitions of an accident and a serious incident as well as examples thereof can be found in Regulation (EU) No 996/2010 of the European Parliament and of the Council.

CAT.GEN.MPA.110 Authority of the commander

Regulation (EU) No 965/2012

The operator shall take all reasonable measures to ensure that all persons carried in the aircraft obey all lawful commands given by the commander for the purpose of securing the safety of the aircraft and of persons or property carried therein.

CAT.GEN.MPA.115 Personnel or crew members other than cabin crew in the passenger compartment

Regulation (EU) No 965/2012

The operator shall ensure that personnel or crew members, other than operating cabin crew members, carrying out their duties in the passenger compartment of an aircraft:

- (a) are not confused by the passengers with operating cabin crew members;
- (b) do not occupy required cabin crew assigned stations;
- (c) do not impede operating cabin crew members in their duties.

AMC1 CAT.GEN.MPA.115(a) Personnel or crew members other than cabin crew in the passenger compartment

ED Decision 2014/015/R

MEASURES TO PREVENT CONFUSION BY PASSENGERS

If personnel or crew members other than operating cabin crew members carry out duties in a passenger compartment, the operator should ensure that they do not perform tasks or wear a uniform in such a way that might identify them as members of the operating cabin crew.

GM1 CAT.GEN.MPA.115 Personnel or crew members other than cabin crew in the passenger compartment

ED Decision 2014/015/R

POSITIONING CABIN CREW MEMBERS

To prevent confusion by passengers and undue expectations in case of emergency, positioning cabin crew members should not wear, or should at least make invisible to passengers, parts of the operator's cabin crew uniform, such as main jacket or crew signs or badges, that might identify them as members of the operating cabin crew.

CAT.GEN.MPA.120 Common language

Regulation (EU) No 965/2012

The operator shall ensure that all crew members can communicate with each other in a common language.

CAT.GEN.MPA.124 Taxiing of aircraft

Regulation (EU) 2015/140

The operator shall establish procedures for taxiing of aircraft in order to ensure safe operation and in order to enhance runway safety.

AMC1 CAT.GEN.MPA.124 Taxiing of aircraft

ED Decision 2015/007/R

PROCEDURES FOR TAXIING

Procedures for taxiing should include at least the following:

- (a) application of the sterile flight crew compartment procedures;
- (b) use of standard radio-telephony (RTF) phraseology;
- (c) use of lights;
- (d) measures to enhance the situational awareness of the minimum required flight crew members. The following list of typical items should be adapted by the operator to take into account its operational environment:
 - (1) each flight crew member should have the necessary aerodrome layout charts available;
 - (2) the pilot taxiing the aircraft should announce in advance his/her intentions to the pilot monitoring;

- (3) all taxi clearances should be heard and should be understood by each flight crew member;
 - (4) all taxi clearances should be cross-checked against the aerodrome chart and aerodrome surface markings, signs, and lights;
 - (5) an aircraft taxiing on the manoeuvring area should stop and hold at all lighted stop bars, and may proceed further when an explicit clearance to enter or cross the runway has been issued by the aerodrome control tower, and when the stop bar lights are switched off;
 - (6) if the pilot taxiing the aircraft is unsure of his/her position, he/she should stop the aircraft and contact air traffic control;
 - (7) the pilot monitoring should monitor the taxi progress and adherence to the clearances, and should assist the pilot taxiing;
 - (8) any action which may disturb the flight crew from the taxi activity should be avoided or done with the parking brake set (e.g. announcements by public address);
- (e) subparagraphs (d)(2) and (d)(7) are not applicable to single-pilot operations.

CAT.GEN.MPA.125 Taxiing of aeroplanes

Regulation (EU) No 965/2012

The operator shall ensure that an aeroplane is only taxed on the movement area of an aerodrome if the person at the controls:

- (a) is an appropriately qualified pilot; or
- (b) has been designated by the operator and:
 - (1) is trained to taxi the aircraft;
 - (2) is trained to use the radio telephone;
 - (3) has received instruction in respect of aerodrome layout, routes, signs, marking, lights, air traffic control (ATC) signals and instructions, phraseology and procedures;
 - (4) is able to conform to the operational standards required for safe aeroplane movement at the aerodrome.

GM1 CAT.GEN.MPA.125 Taxiing of aeroplanes

ED Decision 2014/015/R

SKILLS AND KNOWLEDGE

The following skills and knowledge may be assessed to check if a person can be authorised by the operator to taxi an aeroplane:

- (a) positioning of the aeroplane to ensure safety when starting engine;
- (b) getting ATIS reports and taxi clearance, where applicable;
- (c) interpretation of airfield markings/lights/signals/indicators;
- (d) interpretation of marshalling signals, where applicable;
- (e) identification of suitable parking area;

- (f) maintaining lookout and right-of-way rules and complying with air traffic control (ATC) or marshalling instructions, when applicable;
- (g) avoidance of adverse effect of propeller slipstream or jet wash on other aeroplanes, aerodrome facilities and personnel;
- (h) inspection of taxi path when surface conditions are obscured;
- (i) communication with others when controlling an aeroplane on the ground;
- (j) interpretation of operational instructions;
- (k) reporting of any problem that may occur while taxiing an aeroplane; and
- (l) adapting the taxi speed in accordance with prevailing aerodrome, traffic, surface and weather conditions.

GM2 CAT.GEN.MPA.125 Taxiing of aeroplanes

ED Decision 2015/007/R

SAFETY-CRITICAL ACTIVITY

- (a) Taxiing should be treated as a safety-critical activity due to the risks related to the movement of the aeroplane and the potential for a catastrophic event on the ground.
- (b) Taxiing is a high-workload phase of flight that requires the full attention of the flight crew.

CAT.GEN.MPA.130 Rotor engagement — helicopters

Regulation (EU) No 965/2012

A helicopter rotor shall only be turned under power for the purpose of flight with a qualified pilot at the controls.

GM1 CAT.GEN.MPA.130 Rotor engagement — helicopters

ED Decision 2014/015/R

INTENT OF THE RULE

- (a) The following two situations where it is allowed to turn the rotor under power should be distinguished:
 - (1) for the purpose of flight, this is described in the Implementing Rule;
 - (2) for maintenance purposes.
- (b) Rotor engagement for the purpose of flight: the pilot should not leave the control when the rotors are turning. For example, the pilot is not allowed to get out of the aircraft in order to welcome passengers and adjust their seat belts with the rotors turning.
- (c) Rotor engagement for the purpose of maintenance: the Implementing Rule, however, does not prevent ground runs being conducted by qualified personnel other than pilots for maintenance purposes.

The following conditions should be applied:

- (1) the operator should ensure that the qualification of personnel, other than pilots, who are authorised to conduct maintenance runs is described in the appropriate manual;
- (2) ground runs should not include taxiing the helicopter;

- (3) there should be no passengers on board; and
- (4) maintenance runs should not include collective increase or autopilot engagement (due to the risk of ground resonance).

CAT.GEN.MPA.135 Admission to the flight crew compartment

Regulation (EU) No 965/2012

- (a) The operator shall ensure that no person, other than a flight crew member assigned to a flight, is admitted to, or carried in, the flight crew compartment unless that person is:
 - (1) an operating crew member;
 - (2) a representative of the competent or inspecting authority, if required to be there for the performance of his/her official duties; or
 - (3) permitted by and carried in accordance with instructions contained in the operations manual.
- (b) The commander shall ensure that:
 - (1) admission to the flight crew compartment does not cause distraction or interference with the operation of the flight; and
 - (2) all persons carried in the flight crew compartment are made familiar with the relevant safety procedures.
- (c) The commander shall make the final decision regarding the admission to the flight crew compartment.

AMC1 CAT.GEN.MPA.135(a)(3) Admission to the flight crew compartment

ED Decision 2014/015/R

INSTRUCTIONS FOR SINGLE-PILOT OPERATIONS UNDER VFR BY DAY

Where an aircraft is used in a single-pilot operation under visual flight rules (VFR) by day, but has more than one pilot station, the instructions of the operator may permit passengers to be carried in the unoccupied pilot seat(s), provided that the commander is satisfied that:

- (a) it will not cause distraction or interference with the operation of the flight; and
- (b) the passenger occupying a pilot seat is familiar with the relevant restrictions and safety procedures.

CAT.GEN.MPA.140 Portable electronic devices

Regulation (EU) No 965/2012

The operator shall not permit any person to use a portable electronic device (PED) on board an aircraft that could adversely affect the performance of the aircraft's systems and equipment, and shall take all reasonable measures to prevent such use.

AMC1 CAT.GEN.MPA.140 Portable electronic devices

ED Decision 2019/008/R

TECHNICAL PREREQUISITES FOR THE USE OF PEDS

(a) Scope

This AMC describes the technical prerequisites under which any kind of portable electronic device (PED) may be used on board the aircraft without adversely affecting the performance of the aircraft's systems and equipment.

(b) Prerequisites concerning the aircraft configuration

- (1) Before an operator may permit the use of any kind of PED on-board, it should ensure that PEDs have no impact on the safe operation of the aircraft. The operator should demonstrate that PEDs do not interfere with on-board electronic systems and equipment, especially with the aircraft's navigation and communication systems.
- (2) The assessment of PED tolerance may be tailored to the different aircraft zones for which the use of PEDs is considered, i.e. may address separately:
 - (i) the passenger compartment;
 - (ii) the flight crew compartment; and
 - (iii) areas not accessible during the flight.

(c) Scenarios for permitting the use of PEDs

- (1) Possible scenarios, under which the operator may permit the use of PEDs, should be as documented in Table 1. The scenarios in Table 1 are listed in a descending order with the least permitting scenario at the bottom.
- (2) Restrictions arising from the corresponding aircraft certification, as documented in the aircraft flight manual (AFM) or equivalent document(s), should stay in force. They may be linked to different aircraft zones, or to particular transmitting technologies covered.
- (3) For Scenarios Nos. 3 to 8 in Table 1 the use of C-PEDs and cargo tracking devices may be further expanded, when the EMI assessment has demonstrated that there is no impact on safety as follows:
 - (i) for C-PEDs by using the method described in (d)(2); and
 - (ii) for cargo tracking devices by using the method described in (d)(3).

Table 1 – Scenarios for permitting the use of PEDs by the operator

No.	Technical condition	Non-intentional transmitters	T-PEDs
1	The aircraft is certified as T-PED tolerant, i.e. it has been demonstrated during the aircraft certification process that front door and back door coupling have no impact on the safe operation of the aircraft	All phases of flight	All phases of flight
2	A complete electromagnetic interference (EMI) assessment for all technologies, using the method described in (d)(1), has been performed and has demonstrated the T-PED tolerance	All phases of flight	All phases of flight

No.	Technical condition	Non-intentional transmitters	T-PEDs
3	The aircraft is certified for the use of T-PEDs using particular technologies (e.g. WLAN or mobile phone)	All phases of flight	All phases of flight, restricted to those particular technologies
4	The EMI assessment, using the method described in (d)(1), has demonstrated that: <ul style="list-style-type: none"> (a) the front door coupling has no impact on safety; and (b) the back door coupling has no impact on safety when using particular technologies (e.g. WLAN or mobile phone) 	All phases of flight	All phases of flight, restricted to those particular technologies
5	The EMI assessment, using the method described in (d)(1)(i), has demonstrated that the front door coupling has no impact on safety caused by non-intentional transmitters	All phases of flight	Not permitted
6	The EMI assessment, using the method described in (d)(1)(ii), has demonstrated that the back door coupling has no impact on safety when using particular technologies (e.g. WLAN or mobile phone)	All phases of flight - except low visibility approach operation	All phases of flight - except low visibility approach operation, restricted to those particular technologies
7	An EMI assessment has not been performed	All phases of flight - except low visibility approach operation	Not permitted
8	Notwithstanding Scenarios Nos. 3 to 7	<ul style="list-style-type: none"> (a) before taxi-out; (b) during taxi-in after the end of landing roll; and (c) the commander may permit the use during prolonged departure delays, provided that sufficient time is available to check the passenger compartment before the flight proceeds 	

(d) Demonstration of electromagnetic compatibility

(1) EMI assessment at aircraft level

The means to demonstrate that the radio frequency (RF) emissions (intentional or non-intentional) are tolerated by aircraft systems should be as follows:

(i) to address front door coupling susceptibility for any kind of PEDs:

- (A) EUROCAE, 'Guidance for the use of Portable Electronic Devices (PEDs) on Board Aircraft', ED-130A / RTCA DO-363 'Guidance for the Development of Portable Electronic Devices (PED) Tolerance for Civil Aircraft', Section 5; or
- (B) EUROCAE, 'Aircraft Design and Certification for Portable Electronic Device (PED) Tolerance', ED-239 / RTCA DO-307A, Section 4;

The use of RTCA, 'Guidance on Allowing Transmitting Portable Electronic Devices (T PEDs) on Aircraft', DO-294C (or later revisions), Appendix 5C; or RTCA DO-307 'Aircraft Design and Certification for Portable Electronic Device (PED) Tolerance', (including Change 1 or later revisions), Section 4 may be acceptable.

- (ii) to address back door coupling susceptibility for T-PEDs:
 - (A) EUROCAE, 'Guidance for the use of portable electronic devices (PEDs) on board aircraft', ED-130A/RTCA DO-363, Section 6; or
 - (B) EUROCAE, 'Aircraft Design and Certification for Portable Electronic Device (PED) Tolerance', ED-239 / RTCA DO-307A, Section 3; or
 - (C) The use of EUROCAE, 'Guidance for the use of Portable Electronic Devices (PEDs) on Board Aircraft', ED-130, Annex 6; or RTCA DO-294C (or later revisions), Appendix 6D; or RTCA DO-307 (including Change 1 or later revisions), Section 3 may be acceptable.
- (2) Alternative EMI assessment of controlled PEDs (C-PEDs)
 - (i) To address front door coupling:
 - (A) C-PEDs should comply with the levels as defined by:
 - (a) EUROCAE/RTCA, 'Environmental conditions and test procedures for airborne equipment', ED-14D/DO-160D (or later revisions), Section 21, Category M, for operation in the passenger compartment and the flight crew compartment; and
 - (b) EUROCAE ED-14D/RTCA DO-160D (or later revisions), Section 21, Category H, for operation in areas not accessible during the flight.
 - (B) If the C-PEDs are electronic flight bags used in the flight crew compartment and if the DO-160 testing described in (A) identifies inadequate margins for interference or has not been performed, it is necessary to test the C-PED in each aircraft model in which it will be operated. The C-PED should be tested in operation on the aircraft to show that no interference with aircraft equipment occurs. Credit may be given to other aircraft that are similarly equipped (meaning in particular that they contain the same avionics equipment) of the same make and model as the one tested.
 - (ii) To address back door coupling susceptibility for C-PEDs with transmitting capabilities, the EMI assessment described in (1)(ii) should be performed.
- (3) Alternative EMI assessment of cargo tracking devices

In cases where a transmitting function is automatically deactivated in a cargo tracking device that is a T-PED, the unit should be qualified for safe operation on board the aircraft. One of the following methods should be considered to be acceptable as evidence of its safe operation:

- (i) A type-specific safety assessment, including failure mode and effects analysis, has been performed at the aircraft level. The main purpose of the assessment should be to determine the hazards and to demonstrate that the design assurance levels of the relevant hardware and software components of the cargo tracking device are adequate.
- (ii) The high intensity radiated field (HIRF) certification of the aircraft has been performed, i.e. the aircraft type has been certified after 1987 and meets the appropriate special condition. In such a case, the operator should ensure that the following conditions are met:
 - (A) The tracking device:

- (a) features an automated and prolonged radio suspension in flight using multiple modes of redundancy; and
 - (b) has been verified in the aircraft environment to ensure deactivation of the transmitting function in flight.
 - (B) The emissions from the tracking device comply with the levels as defined by EUROCAE ED-14E/RTCA DO-160E (or later revisions), Section 21, Category H.
 - (C) The operator should ensure that the following documents are provided by the tracking device manufacturer:
 - (a) a declaration from the manufacturer identifying the device and confirming that the device and its deactivation function comply with the requirement (A) and (B) above;
 - (b) a declaration showing that robust design and production controls are in place during the manufacturing of the tracking device;
 - (c) a declaration of conformity and technical documentation showing compliance with the European Norms (EN), regulating the transmitter characteristics of the tracking device or its transmission module; and
 - (d) the EMI assessment report documenting compliance with point (B) above.
 - (iii) The tracking device interference levels during transmission are below those considered acceptable for the specific aircraft environment.
- (e) Operational conditions of C-PEDs and cargo tracking devices

The operator should ensure that C-PEDs and cargo tracking devices are maintained in good and safe condition, having in mind that:

 - (1) damage may modify their emissions characteristics; and
 - (2) damage to the battery may create a fire hazard.
- (f) Batteries in C-PEDs and cargo tracking devices

Lithium-type batteries in C-PEDs and cargo tracking devices should meet:

 - (1) United Nations (UN) Transportation Regulations, 'Recommendations on the transport of dangerous goods - manual of tests and criteria', UN ST/SG/AC.10/11; and
 - (2) one of the following standards:
 - (i) Underwriters Laboratory, 'Lithium batteries', UL 1642;
 - (ii) Underwriters Laboratory, 'Household and commercial batteries', UL 2054;
 - (iii) Underwriters Laboratory, 'Information technology equipment – safety', UL 60950-1;
 - (iv) International Electrotechnical Commission (IEC), 'Secondary cells and batteries containing alkaline or other non-acid electrolytes - safety requirements for portable sealed secondary cells, and for batteries made from them, for use in portable applications', IEC 62133;
 - (v) RTCA, 'Minimum operational performance standards for rechargeable lithium battery systems', DO-311. RTCA DO-311 may be used to address concerns regarding overcharging, over-discharging, and the flammability of cell

components. The standard is intended to test permanently installed equipment; however, these tests are applicable and sufficient to test electronic flight bags rechargeable lithium-type batteries; or

- (vi) European Technical Standard Order (ETSO), 'Non-rechargeable lithium cells and batteries', ETSO C142a.

AMC2 CAT.GEN.MPA.140 Portable electronic devices

ED Decision 2014/029/R

PROCEDURES FOR THE USE OF PEDS

(a) Scope

This AMC describes the procedures under which any kind of portable electronic device (PED) may be used on board the aircraft without adversely affecting the performance of the aircraft's systems and equipment. This AMC addresses the operation of PEDs in the different aircraft zones — passenger compartment, flight compartment, and areas inaccessible during the flight.

(b) Prerequisites

Before permitting the use of any kind of PEDs the operator should ensure compliance with (c) of [AMC1 CAT.GEN.MPA.140](#).

(c) Hazard identification and risk assessment

The operator should identify the safety hazards and manage the associated risks following the management system implemented in accordance with [ORO.GEN.200](#). The risk assessment should include hazards associated with:

- (1) PEDs in different aircraft zones;
- (2) PED use during various phases of flight;
- (3) PED use during turbulence;
- (4) improperly stowed PEDs;
- (5) impeded or slowed evacuations;
- (6) passenger non-compliance, e.g. not deactivating transmitting functions, not switching off PEDs or not stowing PEDs properly;
- (7) disruptive passengers; and
- (8) battery fire.

(d) Use of PEDs in the passenger compartment

(1) Procedures and training

If an operator permits passengers to use PEDs on board its aircraft, procedures should be in place to control their use. These procedures should include provisions for passenger briefing, passenger handling and for the stowage of PEDs. The operator should ensure that all crew members and ground personnel are trained to enforce possible restrictions concerning the use of PEDs, in line with these procedures.

(2) Provisions for use

- (i) The use of PEDs in the passenger compartment may be granted under the responsibility of the operator, i.e. the operator decides which PED may be used during which phases of the flight.
- (ii) Notwithstanding (b), medical equipment necessary to support physiological functions may be used at all times and does not need to be switched-off.

(3) Stowage, passenger information and passenger briefing of PEDs

- (i) In accordance with [CAT.OP.MPA.160](#) the operator should establish procedures concerning the stowage of PEDs. The operator should:
 - (A) identify the phases of flight in which PEDs are to be stowed; and
 - (B) determine suitable stowage locations, taking into account the PEDs' size and weight.
- (ii) The operator should provide general information on the use of PEDs to the passengers before the flight. This information should specify at least:
 - (A) which PEDs can be used during which phases of the flight;
 - (B) when and where PEDs are to be stowed; and
 - (C) that the instructions of the crew are to be followed at all times.
- (iii) In accordance with [CAT.OP.MPA.170](#), the use of PEDs should be part of the passenger briefings. The operator should remind passengers to pay attention and to avoid distraction during such briefings.

(4) In-seat electrical power supplies

Where in-seat electrical power supplies are available for passenger use, the following should apply:

- (i) information giving safety instructions should be provided to the passengers;
- (ii) PEDs should be disconnected from any in-seat electrical power supply during taxiing, take-off, approach, landing, and during abnormal or emergency conditions; and
- (iii) flight crew, cabin crew and technical crew should be aware of the proper means to switch-off in-seat power supplies used for PEDs.

(5) Operator's safety measures during boarding and any phase of flight

- (i) Appropriate coordination between flight crew, cabin crew and technical crew should be established to deal with interference or other safety problems associated with PEDs.
- (ii) Suspect equipment should be switched off.
- (iii) Particular attention should be given to passenger misuse of equipment.
- (iv) Thermal runaways of batteries, in particular lithium batteries, and potential resulting fire, should be handled properly.
- (v) The commander may, for any reason and during any phase of flight, require deactivation and stowage of PEDs.

- (vi) When the operator restricts the use of PEDs, consideration should be given to handle special requests to operate a T-PED during any phase of the flight for specific reasons (e.g. for security measures).
- (6) Reporting

Occurrences of suspected or confirmed interference should be reported to the competent authority. Where possible, to assist follow-up and technical investigation, reports should describe the suspected device, identify the brand name and model number, its location in the aircraft at the time of the occurrence, interference symptoms, the device user's contact details and the results of actions taken by the crew.
- (e) Use of PEDs in the flight crew compartment

In the flight crew compartment the operator may permit the use of PEDs, e.g. to assist the flight crew in their duties, when procedures are in place to ensure the following:

 - (1) The conditions for the use of PEDs in-flight are specified in the operations manual.
 - (2) The PEDs do not pose a loose item risk or other hazard.
 - (3) These provisions should not preclude use of a T-PED (specifically a mobile phone) by the flight crew to deal with an emergency. However, reliance should not be predicated on a T-PED for this purpose.
- (f) PEDs not accessible during the flight

PEDs should be switched off, when not accessible for deactivation during flight. This should apply especially to PEDs contained in baggage or transported as part of the cargo. The operator may permit deviation for PEDs for which safe operation has been demonstrated in accordance with [AMC1 CAT.GEN.MPA.140](#). Other precautions, such as transporting in shielded metal boxes, may also be used to mitigate associated risks.

GM1 CAT.GEN.MPA.140 Portable electronic devices

ED Decision 2019/008/R

DEFINITIONS

- (a) Categories of PEDs

PEDs include the following two categories:

 - (1) Non-intentional transmitters can non-intentionally radiate RF transmissions, sometimes referred to as spurious emissions. This category includes, but is not limited to, calculators, cameras, radio receivers, audio and video players, electronic games and toys; when these devices are not equipped with a transmitting function.
 - (2) Intentional transmitters radiate RF transmissions on specific frequencies as part of their intended function. In addition, they may radiate non-intentional transmissions like any PED. The term 'transmitting PED' (T-PED) is used to identify the transmitting capability of the PED. Intentional transmitters are transmitting devices such as RF-based remote control equipment, which may include some toys, two-way radios (sometimes referred to as 'private mobile radio'), mobile phones of any type, satellite phones, computers with mobile phone data connection, wireless local area network (WLAN) or Bluetooth capability. After deactivation of the transmitting capability, e.g. by activating the so-called 'flight mode' or 'flight safety mode', the T-PED remains a PED having non-intentional emissions.

(b) Cargo tracking device

A cargo tracking device is a PED attached to or included in airfreight (e.g. in or on containers, pallets, parcels or baggage). Cargo tracking devices can be assigned to the category of non-intentional transmitters or T-PEDs. If the device is a T-PED, it complies with the European Norms (EN) for transmissions.

(c) Definition of the switched-off status

Many PEDs are not completely disconnected from the internal power source when switched off. The switching function may leave some remaining functionality e.g. data storage, timer, clock, etc. These devices can be considered switched off when in the deactivated status. The same applies to devices having no transmitting capability and are operated by coin cells without further deactivation capability, e.g. wrist watches.

(d) Electromagnetic interference (EMI)

The two classes of EMI to be addressed can be described as follows:

- (1) Front door coupling is the possible disturbance to an aircraft system as received by the antenna of the system and mainly in the frequency band used by the system. Any PED internal oscillation has the potential to radiate low level signals in the aviation frequency bands. Through this disturbance especially the instrument landing system (ILS) and the VHF omni range (VOR) navigation system may indicate erroneous information.
- (2) Back door coupling is the possible disturbance of aircraft systems by electromagnetic fields generated by transmitters at a level which could exceed on short distance (i.e. within the aircraft) the electromagnetic field level used for the aircraft system certification. This disturbance may then lead to system malfunction.

GM2 CAT.GEN.MPA.140 Portable electronic devices

ED Decision 2014/029/R

CREW REST COMPARTMENT, NAVIGATION, TEST ENTITIES AND FIRE CAUSED BY PEDS

- (a) When the aircraft is equipped with a crew rest compartment, it is considered being part of the passenger compartment.
- (b) Front door coupling may influence the VOR navigation system. Therefore, the flight crew monitors other navigation sensors to detect potential disturbances by PEDs, especially during low visibility departure operation based on VOR guidance.
- (c) Specific equipment, knowledge and experience are required, when the industry standards for evaluating technical prerequisites for the use of PEDs are applied. In order to ensure conformity with the industry standards, the operator is encouraged to cooperate with an appropriately qualified and experienced entity, as necessary. For this entity an aviation background is not required, but is considered to be beneficial.
- (d) Guidance to follow in case of fire caused by PEDs is provided by the International Civil Aviation Organisation, 'Emergency response guidance for aircraft incidents involving dangerous goods', ICAO Doc 9481-AN/928.

GM3 CAT.GEN.MPA.140 Portable electronic devices

ED Decision 2019/008/R

EVALUATION OF CARGO TRACKING DEVICES

(a) Safety assessment

Further guidance on performing a safety assessment can be found in:

- (1) EASA, 'Certification specifications and acceptable means of compliance for large aeroplanes', CS-25, Book 2, AMC-Subpart F, AMC 25.1309;
- (2) EUROCAE/SAE, 'Guidelines for development of civil aircraft and systems', ED-79/ARP 4754 (or later revisions); and
- (3) SAE, 'Guidelines and methods for conducting the safety assessment process on civil airborne systems and equipment', ARP 4761 (or later revisions).

(b) HIRF certification

The type certificate data sheet (TCDS), available on the EASA website for each aircraft model having EASA certification, lists whether the HIRF certification has been performed through a special condition. The operator may contact the type certification holder to gain the necessary information.

(c) Multiple modes of redundancy

Multiple modes of redundancy means that the device is designed with a minimum of two independent means to turn it off completely, turn off the cellular or mobile functions, or a combination of both when airborne. These independent methods should use different sources to identify that the aircraft is in flight, for example, a cargo-tracking device may be designed to sense rapid altitude changes and acceleration to determine when to turn off cellular transmissions. Redundant sources of the same information, such as two vertical accelerometers, should not be considered independent.

CAT.GEN.MPA.141 Use of electronic flight bags (EFBs)

Regulation (EU) 2018/1975

- (a) Where an EFB is used on board an aircraft, the operator shall ensure that it does not adversely affect the performance of the aircraft systems or equipment, or the ability of the flight crew member to operate the aircraft.
- (b) The operator shall not use a type B EFB application unless it is approved in accordance with Subpart M of Annex V (Part-SPA).

GM1 CAT.GEN.MPA.141 Use of electronic flight bags (EFBs)

ED Decision 2019/008/R

DEFINITIONS

For the purpose of EFB use, the following definitions apply:

(a) Aircraft administrative communications (AAC):

AAC are defined by ICAO as non-safety communications that are used by aeronautical operating agencies and are related to the business aspects of operating their flights and transport services. These communications are used for a variety of purposes, such as flight and ground transportation, bookings, deployment of crew, and aircraft or any other logistical purposes that

maintain or enhance the efficiency of overall flight operations. AAC data links receive/transmit information that includes, but is not limited to, the support of EFB applications.

(b) Aeronautical operational control (AOC):

AOC communications are defined by ICAO as communications required for the exercise of authority over the initiation, continuation, diversion or termination of flight for safety, regularity, and efficiency reasons.

GM2 CAT.GEN.MPA.141 Use of electronic flight bags (EFBs)

ED Decision 2019/008/R

BACKGROUND INFORMATION

Further related information on EFB hardware and EFB applications can be found in the following documents:

- (a) EASA AMC 20-25, Airworthiness considerations for EFBs;
- (b) EASA CS-25, Book 2, AMC Subpart F, AMC 25.1309, System Design and Analysis;
- (c) EUROCAE ED-14D/DO-160D (or later revisions) Environmental Conditions and Test Procedures for Airborne Equipment;
- (d) EASA ETSO-C165A, Electronic Map Systems for Graphical Depiction of Aircraft Position;
- (e) FAA AC 120-76(C), Authorization for an Electronic Flight Bag Program;
- (f) FAA AC 120-78, Electronic Signatures, Electronic Recordkeeping, and Electronic Manuals;
- (g) ICAO Doc 10020, Manual of Electronic Flight Bags (EFBs).

AMC1 CAT.GEN.MPA.141(a) Use of electronic flight bags (EFBs)

ED Decision 2019/008/R

HARDWARE

Before using a portable EFB, the following considerations should be assessed by the operator:

(a) General

A portable EFB is a portable electronic device (PED) and may host type A and/or type B EFB applications. In addition, it may host miscellaneous software applications. Portable EFBs are controlled PEDs (C-PEDs).

A portable EFB should be capable of operation autonomously inside and outside the aircraft.

The mass, dimensions, shape, and position of the portable EFB should not compromise flight safety.

The power supply of a portable EFB may be provided by aircraft sources through an adequate power source.

If mounted or stowed, a portable EFB should be easily removable from its mounting device/viewable stowage device or attached to it, without the use of tools by the flight crew. Any locking devices used to prevent theft should be unlocked during flight.

A portable EFB may be part of a system that contains EFB-installed resources which are part of the certified aircraft configuration. The intended functions of the EFB-installed components may be to mount the EFB onto the aircraft and/or connect it to other systems.

Portable EFBs may be used in all phases of the flight if secured to a certified mount or securely attached to a viewable stowage device in a manner that allows its use.

Portable EFBs that do not meet the above characteristics should be stowed during critical phases of the flight.

However, this does not preclude a flight crew from using a portable EFB during restricted portions of the critical phases of flight to complete a task related to the safety of the flight on the condition that the device is continuously handheld and used only during a short period of time. When the task is completed, the device should be stowed again.

Any EFB component that is either not accessible in the flight crew compartment by the flight crew members or not removable by the flight crew members should be installed as 'certified equipment' covered by a type certificate (TC), a change to a TC or a supplemental (S)TC.

(b) Characteristics and placement of the EFB display

For a portable EFB, the considerations on the location of the display proposed below should apply to the proposed location of the display when the EFB is in use.

The EFB display and any other elements of the EFB system should be placed in such a way that they do not unduly impair the flight crew's external view during any of the phases of the flight. Equally, they should not impair the view of or access to any flight-crew-compartment control or instrument.

The location of the display unit and the other EFB system elements should be assessed for their possible impact on egress requirements.

When the EFB is in use (intended to be viewed or controlled), its display should be within 90 degrees on either side of each flight crew member's line of sight.

Glare and reflection on the EFB display should not interfere with the normal duties of the flight crew.

(c) Power source

If the aircraft is equipped with electrical power outlet(s) in the flight crew compartment, the operator should ensure that their certified characteristics are compatible with the intended use of the EFB system. The powering or charging of the EFB system should be compatible with the electrical characteristics of the power supplied by the outlets in terms of power consumption, voltage, frequency, etc., not to impair the EFB system or other aircraft systems.

(d) EFB data connectivity

Portable EFBs may have data connectivity to aircraft systems, either wired or wireless, provided that the connections (hardware and software for data connection provisions) and adequate interface protection devices are incorporated into the aircraft type design.

A portable EFB may receive any data from aircraft systems, but data transmission from EFBs should be limited to aircraft systems that have been certified for this intended purpose (refer to AMC 20-25 for more details).

(e) External connecting cables (to avionics and/or power sources)

When external cables are used to connect a portable EFB to the aircraft systems and/or to a power source, the following should apply:

- (1) cables should not hang loosely in a way that compromises task performance and safety; flight crew members should be able to easily secure the cables out of the way during operations (e.g. by using cable tether straps); and

-
- (2) cables should be of sufficient length so that they do not obstruct the use of any movable device (e.g. flight controls, switches, seats, windows) in the flight crew compartment.
- (f) Electromagnetic interference (EMI) demonstrations
- See paragraph (b), (c) and (d) of [AMC1 CAT.GEN.MPA.140](#).
- The EMI demonstration should cover any cable connected to the EFB as well as non-certified power chargers.
- (g) Batteries
- See paragraph (f) of [AMC1 CAT.GEN.MPA.140](#).
- (h) Viewable stowage
- The evaluation of the viewable stowage should be performed for a given location in the flight deck. This location should be documented and this information should be part of the EFB policy.
- The viewable stowage should not be positioned in such a way that it creates significant obstruction to the flight crew members' view or hinders physical access to aircraft controls and/or displays and/or aircraft safety equipment, flight crew ingress or egress. The viewable stowage as positioned should allow the flight crew to retain a sufficiently extensive, clear, and undistorted view, to enable them to safely perform any manoeuvres within the operating limitations of the aircraft, including taxiing, take-off, approach, and landing. The design of the viewable stowage should allow the user easy access to any item of the EFB system, even if stowed, and notably to the EFB controls and a clear view of the EFB display while in use. The following design practices should be considered:
- (1) The viewable stowage and associated mechanisms should not impede the flight crew members in the performance of any task (whether normal, abnormal, or emergency) associated with operating any aircraft system;
 - (2) When the viewable stowage is used to secure an EFB display, it should be able to be easily locked in position. If necessary, the selection of positions should be adjustable enough to accommodate a range of flight crew member preferences. In addition, the range of available movement should accommodate the expected range of users' physical abilities (i.e. anthropometric constraints). Locking mechanisms should be of a low-wear type that will minimise slippage even after extended periods of normal use;
 - (3) The viewable stowage should be designed and installed so that it will sustain all foreseeable conditions relative to the flight environment (e.g. severe turbulence, hard landings) while retaining its structural integrity and without becoming detached. The use of restraints of the device should be considered where appropriate;
 - (4) A provision should be available to secure or lock the device in a position out of the way of flight crew operations when not in use. When stowed, the device and its securing mechanism should not intrude into the flight crew compartment space to the extent that they cause either visual or physical obstruction of flight controls/displays and/or ingress/egress routes;
 - (5) Possible mechanical interference issues of the viewable stowage, either on the side panel (side stick controller), or on the control yoke, in terms of full and free movement under all operating conditions and non-interference with buckles, etc., should be prevented;
 - (6) Adequate means should be provided (e.g. hardware or software) to shut down the portable EFB when its controls are not accessible by the flight crew members when strapped in the normal seated position; and

- (7) The viewable stowage device should be easily removable from the aircraft without the use of tools.

Some types of means for securing viewable stowage may have characteristics that degrade noticeably with ageing or due to various environmental factors. In that case, the documentation should include procedures (e.g. crew procedures, checks, or maintenance actions) to ensure that the stowage characteristics remain within acceptable limits for the proposed operations. Securing means based on vacuums (e.g. suction cups) have holding capacities that decrease with pressure. It should be demonstrated that they will still perform their intended function at operating cabin altitudes or in the event of a rapid decompression.

In addition, it should be demonstrated that if the EFB moves or is separated from its stowage, or if the viewable stowage is unsecured from the aircraft (as a result of turbulence, manoeuvring, or other action), it will not jam flight controls, damage flight deck equipment, or injure flight crew members.

The risks associated with an EFB fire should be minimised by the design and location of the viewable stowage.

GM1 CAT.GEN.MPA.141(a) Use of electronic flight bags (EFBs)

ED Decision 2019/008/R

VIEWABLE STOWAGE

- (a) Viewable stowage devices have been involved in several reported incidents worldwide. The following issues should be considered by the operator when assessing the compliance of a viewable stowage device:
- (1) The EFB or EFB stowage interfering with controls (e.g. side sticks, tillers, PTT switches, etc.);
 - (2) Stowage or EFB cables interfering with the opening of windows;
 - (3) Stowage or EFB cables interfering with the access to oxygen masks;
 - (4) The EFB falling during take-off, cruise, or landing, interfering with flight controls, disengaging the autopilot, or hurting the flight crew; and
 - (5) Suction cups detaching following a loss of pressurisation, adding to the crew's workload.
- (b) Guidance on the safety, reliability and usability of different viewable stowage solutions and on the related operating conditions can be found in a study published by the FAA¹.

With regard to the specific example of suction cups, the following means of mitigation are recommended:

- (1) The suction cups and the surface to which they will be attached should be properly cleaned with isopropyl alcohol or aircraft window cleaner prior to attachment of the suction cups;
- (2) Attachment surfaces should be substantially smooth and flat;
- (3) Periodic cleaning and reattachment should be performed, as appropriate, for the conditions of the environment in which they are used (dusty, etc.);

¹ <http://fsims.faa.gov/wdocs/other/efb%20securing%20solutions%20environmental%20test%20report.pdf>

- (4) Suction cups should not be left attached to the aircraft windscreen for long periods of time;
- (5) Suction cups should be replaced every 6 months at a minimum, and, more often in extreme environments.

AMC1 CAT.GEN.MPA.141(b) Use of electronic flight bags (EFBs)

ED Decision 2019/008/R

APPLICATION CLASSIFICATION

An EFB software application is an application that is not part of the configuration of the certified aircraft and is installed on an EFB system to support flight operations. The classification of the applications, based on their respective safety effects, is intended to provide clear divisions between such applications and, therefore, between the assessment processes applied to each.

For the purpose of the following process, 'malfunction or misuse' means any failure, malfunction of the application, or design-related human errors that can reasonably be expected in service.

- (a) Determination of an application type:

[AMC2 CAT.GEN.MPA.141\(b\)](#) and [AMC3 CAT.GEN.MPA.141\(b\)](#) should be used to justify a classification, provided that the application does not feature design or functional novelties that introduce new forms of crew interaction or unusual procedures.

An application may also be recognised as a type A or type B EFB application through an appropriate approval (e.g. ETSO authorisation) granted by EASA.

If an application is not listed in [AMC2](#) or [AMC3 CAT.GEN.MPA.141\(b\)](#), presents a high degree of novelty, or is not covered by an EASA approval (e.g. ETSO authorisation), the classification should be established using the definitions and criteria provided hereafter.

As a first step, it should be verified that the application does not belong to the following list of applications that are not eligible for classification as either type A or type B EFB applications.

Applications that:

- (1) display information which is tactically used by the flight crew members to check, control or deduce the aircraft position or trajectory, either to follow the intended navigation route or to avoid adverse weather, obstacles or traffic during the flight;
- (2) display information which may be directly used by the flight crew members to assess the real-time status of aircraft critical and essential systems, as a replacement for existing installed avionics, and/or to manage aircraft critical and essential systems following a failure;
- (3) send data to air traffic services;

are not eligible to be classified as either type A or type B EFB applications.

Then, the next steps in this process should be to:

- (1) identify any failure conditions resulting from potential losses of function or malfunction (with either detected or undetected erroneous outputs), taking into consideration any relevant factors (e.g. aircraft/system failures, operational or environmental conditions) and any established mitigation (e.g. flight crew procedures, flight crew training) that would intensify or alleviate the effects; and

- (2) classify the application as follows, based on the assessment of the safety effect of each failure condition:
- (i) if there is no failure condition that may have a safety effect, the application should be classified as a type A EFB application;
 - (ii) if one or several failure conditions with a safety effect that is limited to minor are identified, the application should be classified as type B;
 - (iii) if more severe failure conditions are identified, the application should not be eligible for classification as an EFB application.

Software applications with failure conditions that are classified as more severe than minor are ineligible as type A or type B EFB applications.

Notes:

- The severity of the failure conditions linked to displaying a function that already exists in the certified type design, or that is already authorised through an ETSO, and used with same concept of operation (considering the intended function but also operational means of mitigation), should be considered in the assessment of the severity of the failure condition of an application and cannot be less than the severity already assessed for this function.
- The data resulting from this process may be reused by the operators in the context of the EFB risk assessment process.

(b) Miscellaneous software applications

Miscellaneous software applications are applications that support function(s) that are not directly related to operations conducted by the flight crew on the aircraft. Miscellaneous software applications are not considered to be EFB applications for the purposes of this AMC.

Examples of miscellaneous software applications are web browsers (not used for operational purposes), email clients, picture management applications, or even applications used by ground crews (e.g. for maintenance purposes).

AMC2 CAT.GEN.MPA.141(b) Use of electronic flight bags (EFBs)

ED Decision 2019/008/R

TYPICAL TYPE A EFB APPLICATIONS

The following EFB application should be considered type A EFB applications:

- (a) browsers that display:
- (1) the certificates and other documents which are required to be carried by the applicable operational regulations, including digitally created documents such as:
 - (i) the certificate of registration;
 - (ii) the certificate of airworthiness (CofA);
 - (iii) the noise certificate, and its English translation if applicable;
 - (iv) the air operator certificate (AOC);
 - (v) the operations specifications relevant to the aircraft type, issued with the AOC;
 - (vi) the third-party liability insurance certificate(s); and

- (vii) the aircraft continuing airworthiness records, including the technical log (flight crew view thereof);
- (2) some manuals and additional information and forms which are required to be carried by the applicable operational regulations such as:
 - (i) notifications of special categories of passenger (SCPs) and special loads; and
 - (ii) passenger and cargo manifests, if applicable; and
- (3) other information within the operator's aircraft library such as:
 - (i) airport diversion policy guidance, including a list of special designated airports and/or approved airports with emergency medical service (EMS) support facilities;
 - (ii) maintenance manuals;
 - (iii) emergency response guidance for aircraft incidents involving dangerous goods (see ICAO Doc 9481-AN/928);
 - (iv) aircraft parts manuals;
 - (v) service bulletins/published airworthiness directives, etc.;
 - (vi) current fuel prices at various airports;
 - (vii) trip scheduling and bid lists;
 - (viii) passenger information requests;
 - (ix) examiner and flight instructor records; and
 - (x) flight crew currency requirements;
- (b) interactive applications for crew rest calculations in the framework of flight time limitations;
- (c) interactive forms to comply with the reporting requirements of the competent authority and the operator;
- (d) applications that make use of aircraft administrative communications (AAC) to collect, process and then disseminate data that has no effect on the safe operation of an aircraft.

AMC3 CAT.GEN.MPA.141(b) Use of electronic flight bags (EFBs)

ED Decision 2019/008/R

TYPICAL TYPE B EFB APPLICATIONS

The following EFB applications should be considered type B EFB applications, provided that they do not feature design or functional novelties that introduce new forms of crew interaction or unusual procedures:

- (a) Document browsers that display the manuals and additional information and forms required to be carried by regulations and that are necessary for the safe operation of the aircraft, such as:
 - (1) the operations manual (including the minimum equipment list (MEL) and configuration deviation list (CDL));
 - (2) the aircraft flight manual, or equivalent document;
 - (3) the operational flight plan;
 - (4) meteorological information with graphical interpretation;
 - (5) air traffic services (ATS) flight plan;

- (6) notices to airmen (NOTAMs) and aeronautical information service (AIS) briefing documentation.
- (b) Electronic aeronautical chart applications including en-route, area, approach, and airport surface maps.
- (c) Airport moving map display (AMMD) applications.
- (d) Applications that make use of the aeronautical operational control (AOC) communications to collect, process and then disseminate operational data.
- (e) Aircraft performance calculation applications that use algorithmic data or that perform calculations using software algorithms to provide aircraft performance data such as:
 - (1) take-off, en-route, approach and landing, missed approach and other phases of flight, performance calculations providing limiting masses, distances, times and/or speeds, etc.;
 - (2) power settings, including reduced take-off thrust settings, etc.
- (f) Mass and balance calculation applications used to establish the mass and centre of gravity of the aircraft and to determine that the load and its distribution are such that the mass and balance limits of the aircraft are not exceeded.
- (g) Applications providing in-flight weather information.

GM1 CAT.GEN.MPA.141(b) Use of electronic flight bags (EFBs)

ED Decision 2019/008/R

TACTICAL USE

The tactical use of an EFB application is considered to be related to short-term decision-making, while strategic use is related to long-term decision-making support.

GM2 CAT.GEN.MPA.141(b) Use of electronic flight bags (EFBs)

ED Decision 2019/008/R

HUMAN-MACHINE INTERFACE (HMI) FOR TYPE A EFB APPLICATIONS

An HMI assessment is not required for a type A EFB application. However, type A EFB applications should be designed in accordance with the human factor principles in order to minimise their impacts on crew workload.

CAT.GEN.MPA.145 Information on emergency and survival equipment carried

Regulation (EU) No 965/2012

The operator shall at all times have available for immediate communication to rescue coordination centres (RCCs) lists containing information on the emergency and survival equipment carried on board any of their aircraft.

AMC1 CAT.GEN.MPA.145 Information on emergency and survival equipment carried

ED Decision 2014/015/R

ITEMS FOR COMMUNICATION TO THE RESCUE COORDINATION CENTRE

The information, compiled in a list, should include, as applicable, the number, colour and type of life rafts and pyrotechnics, details of emergency medical supplies, e.g. first-aid kits, emergency medical kits, water supplies and the type and frequencies of emergency portable radio equipment.

CAT.GEN.MPA.150 Ditching — aeroplanes

Regulation (EU) 2019/1384

The operator shall only operate an aeroplane with a passenger seating configuration of more than 30 on overwater flights at a distance from land suitable for making an emergency landing, greater than 120 minutes at cruising speed, or 400 NM, whichever is less, if the aeroplane complies with the ditching provisions prescribed in the applicable certification specification or specifications.

CAT.GEN.MPA.155 Carriage of weapons of war and munitions of war

Regulation (EU) No 965/2012

- (a) The operator shall only transport weapons of war or munitions of war by air if an approval to do so has been granted by all States whose airspace is intended to be used for the flight.
- (b) Where an approval has been granted, the operator shall ensure that weapons of war and munitions of war are:
 - (1) stowed in the aircraft in a place that is inaccessible to passengers during flight; and
 - (2) in the case of firearms, unloaded.
- (c) The operator shall ensure that, before a flight begins, the commander is notified of the details and location on board the aircraft of any weapons of war and munitions of war intended to be carried.

GM1 CAT.GEN.MPA.155 Carriage of weapons of war and munitions of war

ED Decision 2015/007/R

WEAPONS OF WAR AND MUNITIONS OF WAR

- (a) In accordance with Regulation (EC) No 300/2008, weapons of war may be carried on board an aircraft, in a place that is not inaccessible, if the required security conditions in accordance with national laws have been fulfilled and authorisation has been given by the States involved.
- (b) There is no internationally agreed definition of weapons of war and munitions of war. Some States may have defined them for their particular purposes or for national need.
- (c) It is the responsibility of the operator to check, with the State(s) concerned, whether or not a particular weapon or munition is regarded as a weapon of war or munitions of war. In this context, States that may be concerned with granting approvals for the carriage of weapons of war or munitions of war are those of origin, transit, overflight and destination of the consignment and the State of the operator.

- (d) Where weapons of war or munitions of war are also dangerous goods by definition (e.g. torpedoes, bombs, etc.), [CAT.GEN.MPA.200](#) Transport of dangerous goods also applies.

CAT.GEN.MPA.160 Carriage of sporting weapons and ammunition

Regulation (EU) No 965/2012

- (a) The operator shall take all reasonable measures to ensure that any sporting weapons intended to be carried by air are reported to the operator.
- (b) The operator accepting the carriage of sporting weapons shall ensure that they are:
- (1) stowed in the aircraft in a place that is inaccessible to passengers during flight; and
 - (2) in the case of firearms or other weapons that can contain ammunition, unloaded.
- (c) Ammunition for sporting weapons may be carried in passengers' checked baggage, subject to certain limitations, in accordance with the technical instructions.

GM1 CAT.GEN.MPA.160 Carriage of sporting weapons and ammunition

ED Decision 2015/007/R

SPORTING WEAPONS

- (a) In accordance with Regulation (EC) No 300/2008 sporting weapons may be carried on board an aircraft, in a place that is not inaccessible, if the required security conditions in accordance with national laws have been fulfilled and authorisation has been given by the States involved.
- (b) There is no internationally agreed definition of sporting weapons. In general, it may be any weapon that is not a weapon of war or munitions of war. Sporting weapons include hunting knives, bows and other similar articles. An antique weapon, which at one time may have been a weapon of war or munitions of war, such as a musket, may now be regarded as a sporting weapon.
- (c) A firearm is any gun, rifle or pistol that fires a projectile.
- (d) The following firearms are generally regarded as being sporting weapons:
- (1) those designed for shooting game, birds and other animals;
 - (2) those used for target shooting, clay-pigeon shooting and competition shooting, providing the weapons are not those on standard issue to military forces; and
 - (3) airguns, dart guns, starting pistols, etc.
- (e) A firearm, which is not a weapon of war or munitions of war, should be treated as a sporting weapon for the purposes of its carriage on an aircraft.

CAT.GEN.MPA.161 Carriage of sporting weapons and ammunition — alleviations

Regulation (EU) No 965/2012

Notwithstanding [CAT.GEN.MPA.160\(b\)](#), for helicopters with a maximum certified take-off mass (MCTOM) of 3 175 kg or less operated by day and over routes navigated by reference to visual landmarks, a sporting weapon may be carried in a place that is accessible during flight, provided that

the operator has established appropriate procedures and it is impracticable to stow it in an inaccessible stowage during flight.

AMC1 CAT.GEN.MPA.161 Carriage of sporting weapons and ammunition — alleviations

ED Decision 2014/015/R

SPORTING WEAPONS — HELICOPTERS

Procedures for the carriage of sporting weapons may need to be considered if the helicopter does not have a separate compartment in which the weapons can be stowed. These procedures should take into account the nature of the flight, its origin and destination, and the possibility of unlawful interference. As far as possible, the weapons should be stowed so they are not immediately accessible to the passengers, e.g. in locked boxes, in checked baggage that is stowed under other baggage or under fixed netting.

CAT.GEN.MPA.165 Method of carriage of persons

Regulation (EU) No 965/2012

The operator shall take all measures to ensure that no person is in any part of an aircraft in flight that is not designed for the accommodation of persons unless temporary access has been granted by the commander:

- (a) for the purpose of taking action necessary for the safety of the aircraft or of any person, animal or goods therein; or
- (b) to a part of the aircraft in which cargo or supplies are carried, being a part that is designed to enable a person to have access thereto while the aircraft is in flight.

CAT.GEN.MPA.170 Psychoactive substances

Regulation (EU) 2020/745

- (a) The operator shall take all reasonable measures to ensure that no person enters or is in an aircraft when under the influence of psychoactive substances to the extent that the safety of the aircraft or its occupants is likely to be endangered.
- (b) The operator shall develop and implement a policy on the prevention and detection of misuse of psychoactive substances by flight and cabin crew members and by other safety-sensitive personnel under its direct control, in order to ensure that the safety of the aircraft or its occupants is not endangered.
- (c) Without prejudice to the applicable national legislation on data protection concerning testing of individuals, the operator shall develop and implement an objective, transparent and non-discriminatory procedure for the prevention and detection of cases of misuse of psychoactive substances by its flight and cabin crew and other safety-sensitive personnel.
- (d) In case of a confirmed positive test result, the operator shall inform its competent authority and the authority responsible for the personnel concerned, such as a medical assessor of the licensing authority.

AMC1 CAT.GEN.MPA.170(b) Psychoactive substances

ED Decision 2018/012/R

POLICY ON PREVENTION OF MISUSE OF PSYCHOACTIVE SUBSTANCES

- (a) The operator's policy on prevention of misuse of psychoactive substances should ensure that flight and cabin crew, as well as other safety-sensitive personnel, are dealt with in a consistent, just and fair manner as regards the prevention and detection of misuse of psychoactive substances.
- (b) The operator's training policy on misuse of psychoactive substances should include training and/or educational material on:
 - (1) the effects of psychoactive substances on individuals and on flight safety;
 - (2) established procedures within the organisation to prevent misuse of psychoactive substances;
 - (3) individual responsibilities with regard to applicable legislation and policies on psychoactive substances; and
 - (4) assistance provided by the support programme in accordance with [CAT.GEN.MPA.215](#).

AMC2 CAT.GEN.MPA.170(b) Psychoactive substances

ED Decision 2018/012/R

POLICY TO PREVENT MISUSE OF PSYCHOACTIVE SUBSTANCES

The operator's policy should ensure testing for psychoactive substances at least in the following cases:

- (a) upon employment by the operator; and
- (b) with due cause in the following cases:
 - (1) following a reasonable suspicion, and following an assessment by appropriately trained personnel; and
 - (2) after a serious incident or accident within the meaning of Regulation (EU) No 996/2010, provided that testing is possible due to the location of the serious incident or accident.

GM1 CAT.GEN.MPA.170(b) Psychoactive substances

ED Decision 2018/012/R

POLICY ON PREVENTION OF MISUSE OF PSYCHOACTIVE SUBSTANCES

Guidance for the development and implementation of the policy on prevention of misuse of psychoactive substances is contained in ICAO Doc 9654 'Manual on Prevention of Problematic Use of Substances in the Aviation Workplace'.

TRAINING AND EDUCATION PROGRAMMES

Guidance for the development and implementation of training and education programmes is contained in ICAO Doc 9654 'Manual on Prevention of Problematic Use of Substances in the Aviation Workplace'.

GM2 CAT.GEN.MPA.170(b) Psychoactive substances

ED Decision 2018/012/R

OPERATOR RANDOM TESTING PROGRAMME

Nothing should prevent an operator from implementing a random testing programme in accordance with national requirements on testing of individuals, in order to mitigate the risk that misuse of psychoactive substances remains undetected and endangers the safety of the aircraft or its occupants.

GM3 CAT.GEN.MPA.170(b) Psychoactive substances

ED Decision 2018/012/R

MEANING OF 'PERSONNEL UNDER THE DIRECT CONTROL OF THE OPERATOR'

- (a) Personnel under the direct control of the operator means personnel that is directly employed by the operator. This excludes personnel of contractors or subcontractors of the operator unless they act as flight or cabin crew.
- (b) The operator may require the contracted service provider to carry out testing of personnel as part of the contract between the operator and the contracted service provider.

GM4 CAT.GEN.MPA.170(b) Psychoactive substances

ED Decision 2018/012/R

POLICY TO PREVENT MISUSE OF PSYCHOACTIVE SUBSTANCES

After referral and assessment by the medical assessor of the licencing authority, the operator may consider unannounced testing as part of a periodic medical follow-up after rehabilitation and return to work.

AMC1 CAT.GEN.MPA.170(c) Psychoactive substances

ED Decision 2018/012/R

OBJECTIVE, TRANSPARENT AND NON-DISCRIMINATORY TESTING PROCEDURE

The operator's objective, transparent and non-discriminatory testing procedure should specify:

- (a) means to ensure confidentiality and protection of data;
- (b) the responsibilities of the person carrying out a test, which should be in accordance with national legislation;
- (c) the timing and suitable locations for testing;
- (d) that the body responsible for testing should be an independent, accredited body using standard guidelines on psychoactive substance testing in line with national legislation;
- (e) the testing process, and in particular:
 - (1) the psychoactive substances to be tested for;
 - (2) the applicable national legislation and use of recognised quality standards applied to the testing methodology;
 - (3) initial screening and confirmation methods used; and
 - (4) handling of test results, which should be conducted by impartial and trained personnel, in order to ensure adherence to the procedure, to determine the true positives and to prevent false positives;

- (f) applicable limits applying to psychoactive substance tests;
- (g) the process to be followed in case of a confirmed positive test result; and
- (h) the internal appeal process.

CAT.GEN.MPA.175 Endangering safety

Regulation (EU) 2018/1042

- (a) The operator shall take all reasonable measures to ensure that no person recklessly, intentionally or negligently acts or omits to act so as to:
 - (1) endanger an aircraft or person therein; or
 - (2) cause or permit an aircraft to endanger any person or property.
- (b) The operator shall ensure that flight crew has undergone a psychological assessment before commencing line flying in order to:
 - (1) identify psychological attributes and suitability of the flight crew in respect of the work environment; and
 - (2) reduce the likelihood of negative interference with the safe operation of the aircraft.
- (c) Considering the size, nature and complexity of the activity of an operator, an operator may replace the psychological assessment referred to in point (b) with an internal assessment of the psychological attributes and suitability of flight crew.

AMC1 CAT.GEN.MPA.175(b) Endangering safety

ED Decision 2018/012/R

PSYCHOLOGICAL ASSESSMENT

- (a) The psychological assessment should be:
 - (1) appropriate to the particularity, the complexity and the challenges of the operational environment that the flight crew is likely to be exposed to, as defined by a job analysis identifying the safety-critical dimensions related to the flight crew's function and role within the operator and should include at least the following assessment criteria:
 - (i) cognitive abilities;
 - (ii) personality traits;
 - (iii) operational and professional competencies; and
 - (iv) social competences in accordance with crew resource management principles;
 - (2) validated and either directly performed or overseen by a psychologist with acquired knowledge in aviation relevant to the flight crew's operating environment and with expertise in psychological assessment, and where possible, the psychological selection of aviation personnel; and
 - (3) undertaken at least within the past 24 months before commencing line flying, unless the operator can demonstrate that the psychological assessment undertaken more than 24 months ago is still adequate for the risk mitigation as required by [ORO.GEN.200\(a\)\(3\)](#). Such a demonstration should be based on the tests previously performed, an updated risk assessment based on data gathered from previous operational experience and continuous human performance monitoring since the last psychological assessment.

- (b) As regards the psychological assessment, the following should be documented:
- (1) the procedures followed;
 - (2) the personnel involved;
 - (3) the assessment criteria and instruments used in the assessment; and
 - (4) the validity period.

GM1 CAT.GEN.MPA.175(b) Endangering safety

ED Decision 2018/012/R

GUIDANCE ON CONDUCTING A PSYCHOLOGICAL ASSESSMENT

- (a) A psychological assessment performed by one operator may subsequently be accepted by a different operator, provided that the latter is satisfied that the assessment has been performed in accordance with [AMC1 CAT.GEN.MPA.175\(b\)](#).
- (b) A psychological assessment conducted by or on behalf of an operator should not be considered or conducted as a clinical psychological evaluation.
- (c) When establishing the policy on psychological assessment of flight crews, the operator may refer to recognised industry standards and best practices in the field of pilot selection, aptitude testing and psychological assessment such as:
- (1) IATA 'Guidance Material and Best Practices for Pilot Aptitude Testing'; and
 - (2) national or European standards of ethical codes of conduct when conducting a psychological assessment, such as by national or European associations for (aviation) psychology.

AMC1 CAT.GEN.MPA.175(c) Endangering safety

ED Decision 2018/012/R

INTERNAL ASSESSMENT FOR NON-COMPLEX OPERATORS

- (a) An operator may replace the psychological assessment with an internal assessment of the psychological attributes and suitability of the flight crew, if the operator is considered to be a non-complex operator, i.e. when it has a workforce of 20 full-time equivalents (FTEs) or less, that are involved in an activity subject to Regulation (EU) 2018/1139 and its implementing rules.
- (b) The internal assessment for non-complex operators should as far as possible apply the same principles as the psychological assessment before commencing line flying for complex operators.

CAT.GEN.MPA.180 Documents, manuals and information to be carried

Regulation (EU) 2019/1384

- (a) The following documents, manuals and information shall be carried on each flight, as originals or copies unless otherwise specified:
- (1) the aircraft flight manual (AFM), or equivalent document(s);
 - (2) the original certificate of registration;
 - (3) the original certificate of airworthiness (CofA);

-
- (4) the noise certificate, including an English translation, where one has been provided by the authority responsible for issuing the noise certificate;
 - (5) a certified true copy of the air operator certificate (AOC), including an English translation when the AOC has been issued in another language;
 - (6) the operations specifications relevant to the aircraft type, issued with the AOC, including an English translation when the operations specifications have been issued in another language;
 - (7) the original aircraft radio licence, if applicable;
 - (8) the third party liability insurance certificate(s);
 - (9) the journey log, or equivalent, for the aircraft;
 - (10) the aircraft technical log, in accordance with Annex I (Part-M) to Regulation (EU) No 1321/2014;
 - (11) details of the filed ATS flight plan, if applicable;
 - (12) current and suitable aeronautical charts for the route of the proposed flight and all routes along which it is reasonable to expect that the flight may be diverted;
 - (13) procedures and visual signals information for use by intercepting and intercepted aircraft;
 - (14) information concerning search and rescue services for the area of the intended flight, which shall be easily accessible in the flight crew compartment;
 - (15) the current parts of the operations manual that are relevant to the duties of the crew members, which shall be easily accessible to the crew members;
 - (16) the MEL;
 - (17) appropriate notices to airmen (NOTAMs) and aeronautical information service (AIS) briefing documentation;
 - (18) appropriate meteorological information;
 - (19) cargo and/or passenger manifests, if applicable;
 - (20) mass and balance documentation;
 - (21) the operational flight plan, if applicable;
 - (22) notification of special categories of passenger (SCPs) and special loads, if applicable; and
 - (23) any other documentation that may be pertinent to the flight or is required by the States concerned with the flight.
- (b) Notwithstanding (a), for operations under visual flight rules (VFR) by day with other-than complex motor-powered aircraft taking off and landing at the same aerodrome or operating site within 24 hours, or remaining within a local area specified in the operations manual, the following documents and information may be retained at the aerodrome or operating site instead:
- (1) noise certificate;
 - (2) aircraft radio licence;
 - (3) journey log, or equivalent;
 - (4) aircraft technical log;

- (5) NOTAMs and AIS briefing documentation;
 - (6) meteorological information;
 - (7) notification of SCPs and special loads, if applicable; and
 - (8) mass and balance documentation.
- (c) Notwithstanding (a), in case of loss or theft of documents specified in (a)(2) to (a)(8), the operation may continue until the flight reaches its destination or a place where replacement documents can be provided.

AMC1 CAT.GEN.MPA.180 Documents, manuals and information to be carried

ED Decision 2014/015/R

GENERAL

The documents, manuals and information may be available in a form other than on printed paper. Accessibility, usability and reliability should be assured.

GM1 CAT.GEN.MPA.180(a)(1) Documents, manuals and information to be carried

ED Decision 2014/015/R

AIRCRAFT FLIGHT MANUAL OR EQUIVALENT DOCUMENT(S)

‘Aircraft flight manual, or equivalent document(s)’ means in the context of this rule the flight manual for the aircraft, or other documents containing information required for the operation of the aircraft within the terms of its certificate of airworthiness unless these data are available in the parts of the operations manual carried on board.

GM1 CAT.GEN.MPA.180(a)(5)(6) Documents, manuals and information to be carried

ED Decision 2014/015/R

CERTIFIED TRUE COPIES

- (a) Certified true copies may be provided:
- (1) directly by the competent authority; or
 - (2) by persons holding privileges for certification of official documents in accordance with the applicable Member State’s legislation, e.g. public notaries, authorised officials in public services.
- (b) Translations of the air operator certificate (AOC) including operations specifications do not need to be certified.

GM1 CAT.GEN.MPA.180(a)(9) Documents, manuals and information to be carried

ED Decision 2014/015/R

JOURNEY LOG OR EQUIVALENT

‘Journey log, or equivalent’ means that the required information may be recorded in documentation other than a log book, such as the operational flight plan or the aircraft technical log.

AMC1 CAT.GEN.MPA.180(a)(13) Documents, manuals and information to be carried

ED Decision 2014/015/R

PROCEDURES AND VISUAL SIGNALS FOR USE BY INTERCEPTING AND INTERCEPTED AIRCRAFT

The procedures and the visual signals information for use by intercepting and intercepted aircraft should reflect those contained in International Civil Aviation Organization (ICAO) Annex 2. This may be part of the operations manual.

GM1 CAT.GEN.MPA.180(a)(14) Documents, manuals and information to be carried

ED Decision 2014/015/R

SEARCH AND RESCUE INFORMATION

This information is usually found in the State’s aeronautical information publication.

AMC1 CAT.GEN.MPA.180(a)(18) Documents, manuals and information to be carried

ED Decision 2022/005/R

APPROPRIATE METEOROLOGICAL INFORMATION

The appropriate meteorological information should be relevant to the planned operation, as specified in point (a) of point MET.TR.215 of Annex V (Part MET) to [Regulation \(EU\) 2017/373](#), and comprise the following:

- (a) the meteorological information that is specified in point (e) of point MET.TR.215 of Part-MET; and
- (b) supplemental meteorological information:
 - (1) information other than that specified in point (a), which should be based on data from certified meteorological service providers; or
 - (2) information from other reliable sources of meteorological information that should be evaluated by the operator.

GM1 CAT.GEN.MPA.180(a)(18) Documents, manuals and information to be carried

ED Decision 2022/005/R

DATA FROM CERTIFIED METEOROLOGICAL SERVICE PROVIDERS

In the context of point (b)(1) of [AMC1 CAT.GEN.MPA.180\(a\)\(18\)](#), the operator may consider that any meteorological information that is provided by the organisation within the scope of the meteorological information included in the flight documentation defined in point (e) of point MET.TR.215 of Part-MET should originate only from authoritative sources or certified providers, and should not be transformed or tampered, except for the purpose of presenting the data in the correct format. The organisation's process should provide assurance that the integrity of such service is preserved in the data to be used by both flight crews and operators, regardless of their form.

GM2 CAT.GEN.MPA.180(a)(18) Documents, manuals and information to be carried

ED Decision 2022/005/R

INFORMATION FROM OTHER RELIABLE SOURCES OF METEOROLOGICAL INFORMATION

In the context of point (b)(2) of [AMC1 CAT.GEN.MPA.180\(a\)\(18\)](#), reliable sources of meteorological information are organisations that are able to provide an appropriate level of data assurance in terms of accuracy and integrity. The operator may consider in the evaluation that the organisation has a quality assurance system in place that covers source selection, acquisition/import, processing, validity period check, and distribution phase of data.

GM3 CAT.GEN.MPA.180(a)(18) Documents, manuals and information to be carried

ED Decision 2022/005/R

SUPPLEMENTAL METEOROLOGICAL INFORMATION AND SUPPLEMENTARY INFORMATION

Supplemental meteorological information: when operating under specific provisions and without the meteorological information from a certified service provider, the operator should use 'supplemental meteorological information', such as digital imagery. Related information can be found in point (e)(4) of [AMC1 CAT.OP.MPA.192](#).

Supplementary information: it is included in point (a) of [AMC1 CAT.GEN.MPA.180\(a\)\(18\)](#) and refers to meteorological information to be reported in specific cases such as freezing precipitation, blowing snow, thunderstorm, etc.

GM1 CAT.GEN.MPA.180(a)(23) Documents, manuals and information to be carried

ED Decision 2014/015/R

DOCUMENTS THAT MAY BE PERTINENT TO THE FLIGHT

Any other documents that may be pertinent to the flight or required by the States concerned with the flight, may include, for example, forms to comply with reporting requirements.

STATES CONCERNED WITH THE FLIGHT

The States concerned are those of origin, transit, overflight and destination of the flight.

CAT.GEN.MPA.185 Information to be retained on the ground*Regulation (EU) No 965/2012*

- (a) The operator shall ensure that at least for the duration of each flight or series of flights:
 - (1) information relevant to the flight and appropriate for the type of operation is preserved on the ground;
 - (2) the information is retained until it has been duplicated at the place at which it will be stored; or, if this is impracticable
 - (3) the same information is carried in a fireproof container in the aircraft.
- (b) The information referred to in (a) includes:
 - (1) a copy of the operational flight plan, where appropriate;
 - (2) copies of the relevant part(s) of the aircraft technical log;
 - (3) route-specific NOTAM documentation if specifically edited by the operator;
 - (4) mass and balance documentation if required; and
 - (5) special loads notification.

CAT.GEN.MPA.190 Provision of documentation and records*Regulation (EU) No 965/2012*

The commander shall, within a reasonable time of being requested to do so by a person authorised by an authority, provide to that person the documentation required to be carried on board.

CAT.GEN.MPA.195 Handling of flight recorder recordings: preservation, production, protection and use*Regulation (EU) 2019/1387*

- (a) Following an accident, a serious incident or an occurrence identified by the investigating authority, the operator of an aircraft shall preserve the original recorded data of the flight recorders for a period of 60 days or until otherwise directed by the investigating authority.
- (b) The operator shall conduct operational checks and evaluations of the recordings to ensure the continued serviceability of the flight recorders which are required to be carried under this Regulation.
- (c) The operator shall ensure that the recordings of flight parameters and data link communication messages required to be recorded on flight recorders are preserved. However, for the purpose of testing and maintaining those flight recorders, up to 1 hour of the oldest recorded data at the time of testing may be erased.
- (d) The operator shall keep and maintain up to date documentation that presents the necessary information to convert raw flight data into flight parameters expressed in engineering units.
- (e) The operator shall make available any flight recorder recordings that have been preserved, if so determined by the competent authority.

- (f) Without prejudice to Regulation (EU) No 996/2010 and Regulation (EU) 2016/679 of the European Parliament and of the Council¹
- (1) Except for ensuring flight recorder serviceability, audio recordings from a flight recorder shall not be disclosed or used unless all of the following conditions are fulfilled:
 - (i) a procedure related to the handling of such audio recordings and of their transcript is in place;
 - (ii) all crew members and maintenance personnel concerned have given their prior consent;
 - (iii) such audio recordings are used only for maintaining or improving safety.
 - (1a) When inspecting flight recorder audio recordings to ensure flight recorder serviceability, the operator shall protect the privacy of those audio recordings and make sure that they are not disclosed or used for purposes other than for ensuring flight recorder serviceability.
 - (2) Flight parameters or data link messages recorded by a flight recorder shall not be used for purposes other than for the investigation of an accident or an incident which is subject to mandatory reporting, unless such recordings meet any of the following conditions:
 - (i) are used by the operator for airworthiness or maintenance purposes only;
 - (ii) are de-identified;
 - (iii) are disclosed under secure procedures.
 - (3) Except for ensuring flight recorder serviceability, images of the flight crew compartment that are recorded by a flight recorder shall not be disclosed or used unless all of the following conditions are fulfilled:
 - (i) a procedure related to the handling of such image recordings is in place;
 - (ii) all crew members and maintenance personnel concerned have given their prior consent;
 - (iii) such image recordings are used only for maintaining or improving safety.
 - (3a) When images of the flight crew compartment that are recorded by a flight recorder are inspected for ensuring the serviceability of the flight recorder, then:
 - (i) those images shall not be disclosed or used for purposes other than for ensuring flight recorder serviceability;
 - (ii) if body parts of crew members are likely to be visible on the images, the operator shall ensure the privacy of those images.

¹ Regulation (EU) 2016/679 of the European Parliament and of the Council of 27 April 2016 on the protection of natural persons with regard to the processing of personal data and on the free movement of such data, and repealing Directive 95/46/EC (General Data Protection Regulation) (OJ L 119, 4.5.2016, p. 1).

AMC1 CAT.GEN.MPA.195(a) Handling of flight recorder recordings: preservation, production, protection and use

ED Decision 2015/030/R

PRESERVATION OF RECORDED DATA FOR INVESTIGATION

- (a) The operator should establish procedures to ensure that flight recorder recordings are preserved for the investigating authority.
- (b) These procedures should include:
 - (1) instructions for flight crew members to deactivate the flight recorders immediately after completion of the flight and inform relevant personnel that the recording of the flight recorders should be preserved. These instructions should be readily available on board; and
 - (2) instructions to prevent inadvertent reactivation, test, repair or reinstallation of the flight recorders by operator personnel or during maintenance or ground handling activities performed by third parties.

GM1 CAT.GEN.MPA.195(a) Handling of flight recorder recordings: preservation, production, protection and use

ED Decision 2015/030/R

REMOVAL OF RECORDERS IN CASE OF AN INVESTIGATION

The need for removal of the recorders from the aircraft is determined by the investigating authority with due regard to the seriousness of an occurrence and the circumstances, including the impact on the operation.

AMC1 CAT.GEN.MPA.195(b) Handling of flight recorder recordings: preservation, production, protection and use

ED Decision 2021/005/R

INSPECTIONS AND CHECKS OF RECORDINGS

- (a) The operator should perform an inspection of the FDR recording and the CVR recording every year unless one or more of the following applies:
 - (1) If the flight recorder records on magnetic wire or uses frequency modulation technology, the time interval between two inspections of the recording should not exceed 3 months.
 - (2) If the flight recorder is solid-state and the flight recorder system is fitted with continuous monitoring for proper operation, the time interval between two inspections of the recording may be up to 2 years.
 - (3) In the case of an aircraft equipped with two solid-state flight data and cockpit voice combination recorders, where
 - (i) the flight recorder systems are fitted with continuous monitoring for proper operation, and
 - (ii) the flight recorders share the same flight data acquisition, a comprehensive inspection of the recording needs only to be performed for one flight recorder position. The inspection of the recordings should be performed alternately so that each flight recorder position is inspected at time intervals not exceeding 4 years.

- (4) Where all the following conditions are met, the inspection of the FDR recording is not needed:
 - (i) the aircraft flight data is collected in the frame of a flight data monitoring (FDM) programme;
 - (ii) the data acquisition of mandatory flight parameters is the same for the FDR and for the recorder used for the FDM programme;
 - (iii) an inspection similar to the inspection of the FDR recording and covering all mandatory flight parameters is conducted on the FDM data at time intervals not exceeding 2 years; and
 - (iv) the FDR is solid-state and the FDR system is fitted with continuous monitoring for proper operation.
- (b) the operator should perform every 5 years an inspection of the data link recording;
- (c) The operator should perform, at time intervals not exceeding 2 years, an inspection of the recording of flight recorders other than an FDR, which are installed on an aircraft, in order to ensure compliance with [CAT.IDE.A.191](#) or [CAT.IDE.H.191](#).
- (d) When installed, the aural or visual means for preflight checking of the flight recorders for proper operation should be used on each day when the aircraft is operated. When no such means is available for a flight recorder, the operator should perform an operational check of this flight recorder at intervals not exceeding 150 flight hours or 7 calendar days of operation, whichever is considered more suitable by the operator.
- (e) The operator should check every 5 years, or in accordance with the recommendations of the sensor manufacturer, that the parameters dedicated to the FDR and not monitored by other means are being recorded within the calibration tolerances and that there is no discrepancy in the engineering conversion routines for these parameters.

GM1 CAT.GEN.MPA.195(b) Handling of flight recorder recordings: preservation, production, protection and use

ED Decision 2021/005/R

INSPECTION OF THE FLIGHT RECORDERS' RECORDINGS FOR ENSURING SERVICEABILITY

- (a) The inspection of recorded flight parameters usually consists of the following:
 - (1) Making a copy of the complete recording file.
 - (2) Converting the recording to parameters expressed in engineering units in accordance with the documentation required to be held.
 - (3) Examining a whole flight in engineering units to evaluate the validity of all mandatory parameters — this could reveal defects or noise in the measuring and processing chains and indicate necessary maintenance actions. The following should be considered:
 - (i) when applicable, each parameter should be expressed in engineering units and checked for different values of its operational range — for this purpose, some parameters may need to be inspected at different flight phases; and
 - (ii) (only applicable to an FDR) if the parameter is delivered by a digital data bus and the same data are utilised for the operation of the aircraft, then a reasonableness check may be sufficient; otherwise a correlation check may need to be performed:

- (A) a reasonableness check is understood in this context as a subjective, qualitative evaluation, requiring technical judgement, of the recordings from a complete flight; and
 - (B) a correlation check is understood in this context as the process of comparing data recorded by the flight data recorder against the corresponding data derived from flight instruments, indicators or the expected values obtained during specified portion(s) of a flight profile or during ground checks that are conducted for that purpose.
- (4) Retaining the most recent copy of the complete recording file and the corresponding recording inspection report that includes references to the documentation required to be held.
- (b) When performing the inspection of an audio recording from a flight recorder, precautions need to be taken to comply with CAT.GEN.MPA.195(f)(1a). The inspection of the audio recording usually consists of:
 - (1) checking that the flight recorder operates correctly for the nominal duration of the recording;
 - (2) examining samples of in-flight audio recording from the flight recorder for evidence that the signal is acceptable on each channel and in all phases of flight; and
 - (3) preparing and retaining an inspection report.
- (c) The inspection of the DLR recording usually consists of:
 - (1) Checking the consistency of the data link recording with other recordings for example, during a designated flight, the flight crew speaks out a few data link messages sent and received. After the flight, the data link recording and the CVR recording are compared for consistency.
 - (2) Retaining the most recent copy of the complete recording and the corresponding inspection report.
- (d) When inspecting images recorded by a flight recorder, precautions need to be taken to comply with CAT.GEN.MPA.195(f)(3a). The inspection of such images usually consists of the following:
 - (1) checking that the flight recorder operates correctly for the nominal duration of the recording;
 - (2) examining samples of images recorded in different flight phases for evidence that the images of each camera are of acceptable quality; and
 - (3) preparing and retaining an inspection report.

GM2 CAT.GEN.MPA.195(b) Handling of flight recorder recordings: preservation, production, protection and use

ED Decision 2016/012/R

MONITORING AND CHECKING THE PROPER OPERATION OF FLIGHT RECORDERS — EXPLANATION OF TERMS

For the understanding of the terms used in [AMC1 CAT.GEN.MPA.195\(b\)](#):

- (a) 'operational check of the flight recorder' means a check of the flight recorder for proper operation. It is not a check of the quality of the recording and, therefore, it is not equivalent to

an inspection of the recording. This check can be carried out by the flight crew or through a maintenance task.

- (b) 'aural or visual means for preflight checking the flight recorders for proper operation' means an aural or visual means for the flight crew to check before the flight the results of an automatically or manually initiated test of the flight recorders for proper operation. Such a means provides for an operational check that can be performed by the flight crew.
- (c) 'flight recorder system' means the flight recorder, its dedicated sensors and transducers, as well as its dedicated acquisition and processing equipment.
- (d) 'continuous monitoring for proper operation' means for a flight recorder system, a combination of system monitors and/or built-in test functions which operates continuously in order to detect the following:
 - (1) loss of electrical power supply to the flight recorder system;
 - (2) failure of the equipment performing acquisition and processing;
 - (3) failure of the recording medium and/or drive mechanism; and
 - (4) failure of the recorder to store the data in the recording medium as shown by checks of the recorded data including, as reasonably practicable for the storage medium concerned, correct correspondence with the input data.

However, detections by the continuous monitoring for proper operation do not need to be automatically reported to the flight crew compartment.

GM3 CAT.GEN.MPA.195(b) Handling of flight recorder recordings: preservation, production, protection and use

ED Decision 2021/005/R

CVR AUDIO QUALITY

Additional guidance material for performing the CVR recording inspection may be found in the document of the French Bureau d'Enquêtes et d'Analyses, titled 'Guidance on CVR recording inspection' and dated October 2018 or later.

AMC1 CAT.GEN.MPA.195(f)(1) Handling of flight recorder recordings: preservation, production, protection and use

ED Decision 2021/005/R

USE OF AUDIO RECORDINGS FOR MAINTAINING OR IMPROVING SAFETY

- (a) The procedure related to the handling of audio recordings from flight recorders and of their transcripts should be documented and signed by all parties (aircraft operator, crew member representatives nominated either by the union or the crew themselves, maintenance personnel representatives if applicable). This procedure should take into account [Regulation \(EU\) 2016/679¹](#) and as a minimum, define:
 - (1) the method to obtain the consent of all crew members and maintenance personnel concerned;

¹ Regulation (EU) 2016/679 of the European Parliament and of the Council of 27 April 2016 on the protection of natural persons with regard to the processing of personal data and on the free movement of such data, and repealing Directive 95/46/EC (General Data Protection Regulation) (OJ L 119, 4.5.2016, p. 1).

- (2) an access and security policy that restricts access to audio recordings from flight recorders and their transcripts to specifically authorised persons identified by their position;
 - (3) a retention policy and accountability, including the measures to be taken to ensure the security of audio recordings from flight recorders and their transcripts and their protection from misuse. The retention policy should specify the period of time after which such audio recordings and identified transcripts are destroyed;
 - (4) a description of the uses made of audio recordings from flight recorders and their transcripts ;
 - (5) the participation of flight crew member representatives in the assessment of audio recordings from flight recorders and their transcripts;
 - (6) the conditions under which advisory briefing or remedial training should take place; this should always be carried out in a constructive and non-punitive manner; and
 - (7) the conditions under which actions other than advisory briefing or remedial training may be taken for reasons of gross negligence or significant continuing safety concern.
- (b) Each time an audio recording file from a flight recorder is read out under the conditions defined by [CAT.GEN.MPA.195\(f\)\(1\)](#):
- (1) parts of the audio recording file that contain information with a privacy content should be deleted to the extent possible, and it should not be permitted that the detail of information with a privacy content is transcribed; and
 - (2) the operator should retain, and when requested, provide to the competent authority:
 - (i) information on the use made (or the intended use) of the audio recording file; and
 - (ii) evidence that the persons concerned consented to the use made (or the intended use) of the audio recording file.
- (c) The safety manager or the person identified by the operator to fulfil this role should be responsible for the protection and use of audio recordings from flight recorders and their transcripts, as well as for the assessment of issues and their transmission to the manager(s) responsible for the process concerned.
- (d) In case a third party is involved in the use of audio recordings from flight recorders, contractual agreements with this third party should cover the aspects enumerated in (a) and (b).

AMC1 CAT.GEN.MPA.195(f)(1a) Handling of flight recorder recordings: preservation, production, protection and use

ED Decision 2021/005/R

INSPECTION OF AUDIO RECORDINGS FOR ENSURING SERVICEABILITY

- (a) When an inspection of the audio recordings from a flight recorder is performed for ensuring audio quality and intelligibility of recorded communications:
- (1) the privacy of the audio recordings should be ensured (e.g. by locating the replay equipment in a separated area and/or using headsets);
 - (2) access to the replay equipment should be restricted to specifically authorised persons identified by their position;

- (3) provision should be made for the secure storage of the recording medium, the audio recording files and copies thereof;
 - (4) the audio recording files and copies thereof should be destroyed not earlier than 2 months and not later than 1 year after completion of the inspection of the audio recordings, except that audio samples with no privacy content may be retained for enhancing this inspection (e.g. for comparing audio quality);
 - (5) only the accountable manager of the operator and, when identified to comply with ORO.GEN.200, the safety manager should be entitled to request a copy of the audio recording files.
- (b) The conditions enumerated in (a) should also be complied with if the inspection of the audio recordings is subcontracted to a third party. The contractual agreements with the third party should explicitly cover these aspects.

GM1 CAT.GEN.MPA.195(f)(2) Handling of flight recorder recordings: preservation, production, protection and use

ED Decision 2016/012/R

USE OF FDR DATA FOR AN FDM PROGRAMME

The use of FDR data in the framework of an FDM programme may be acceptable if it fulfils the conditions set by sub-paragraph (f)(2) of [CAT.GEN.MPA.195](#).

AMC1 CAT.GEN.MPA.195(f)(3) Handling of flight recorder recordings: preservation, production, protection and use

ED Decision 2021/005/R

USE OF IMAGES FROM THE FLIGHT CREW COMPARTMENT FOR MAINTAINING OR IMPROVING SAFETY

- (a) The procedure related to the handling of images of the flight crew compartment that are recorded by a flight recorder should be documented and signed by all parties involved (aircraft operator, crew member representatives nominated either by the union or the crew themselves, maintenance personnel representatives if applicable). This procedure should take into account Regulation (EU) 2016/679 and, as a minimum, define the following aspects:
- (1) the method to obtain the consent of all crew members and maintenance personnel concerned;
 - (2) an access and security policy that restricts access to the image recordings to specifically authorised persons identified by their position;
 - (3) a retention policy and accountability, including the measures to ensure the security of the image recordings and their protection from misuse. The retention policy should specify the period of time after which such image recordings are destroyed;
 - (4) a description of the uses made of the image recordings;
 - (5) the participation of flight crew member representatives in the assessment of the image recordings;
 - (6) the conditions under which advisory briefing or remedial training should take place; this should always be carried out in a constructive and non-punitive manner; and

- (7) the conditions under which actions other than advisory briefing or remedial training may be taken for reasons of gross negligence or significant continuing safety concern.
- (b) Each time an image recording file from a flight recorder that contains images of the flight crew compartment is read out for purposes other than ensuring the serviceability of that flight recorder:
 - (1) images that contain information with a privacy content should be deleted to the extent possible, and it should not be permitted that the detail of information with a privacy content is transcribed; and
 - (2) the operator should retain, and when requested, provide the competent authority with:
 - (i) information on the use made (or the intended use) of this image recording file; and
 - (ii) evidence that the crew members concerned consented to the use made (or the intended use) of the flight crew compartment images.
- (c) The safety manager or the person identified by the operator to fulfil this role should be responsible for the protection and use of images of the flight crew compartment that are recorded by a flight recorder, as well as for the assessment of issues and their transmission to the manager(s) responsible for the process concerned.
- (d) In case a third party is involved in the use of images of the flight crew compartment that are recorded by a flight recorder, contractual agreements with this third party should cover the aspects enumerated in (a) and (b).

AMC1 CAT.GEN.MPA.195(f)(3a) Handling of flight recorder recordings: preservation, production, protection and use

ED Decision 2021/005/R

INSPECTION OF IMAGES OF THE FLIGHT CREW COMPARTMENT FOR ENSURING SERVICEABILITY

- (a) When images of the flight crew compartment recorded by a flight recorder are inspected for ensuring the serviceability of the flight recorder, and any body part of a crew member is likely to be visible on these images, then:
 - (1) the privacy of the image recordings should be ensured (e.g. by locating the replay equipment in a separated area);
 - (2) access to the replay equipment should be restricted to specifically authorised persons identified by their position;
 - (3) provision should be made for the secure storage of the recording medium, the image recording files and copies thereof;
 - (4) the image recording files and copies thereof should be destroyed not earlier than 2 months and not later than 1 year after completion of the inspection of the image recordings. Images that do not contain any body part of a person may be retained for enhancing this inspection (e.g. for comparing image quality); and
 - (5) only the accountable manager of the operator and, when identified to comply with [ORO.GEN.200](#), the safety manager should be entitled to request a copy of the image recording files.
- (b) The conditions enumerated in (a) should also be complied with if the inspection of the image recording is subcontracted to a third party. The contractual agreements with the third party should explicitly cover these aspects.

GM1 CAT.GEN.MPA.195(f) Handling of flight recorder recordings: preservation, production, protection and use

ED Decision 2021/005/R

FLIGHT CREW COMPARTMENT

If there are no compartments to physically segregate the flight crew from the passengers during the flight, the 'flight crew compartment' in point (f) of CAT.GEN.MPA.195 should be understood as the area including:

- (a) the flight crew seats;
- (b) aircraft and engine controls;
- (c) aircraft instruments;
- (d) windshield and windows used by the flight crew to get an external view while seated at their duty station; and
- (e) circuit breakers accessible by the flight crew while seated at their duty station.

CAT.GEN.MPA.200 Transport of dangerous goods

Regulation (EU) No 965/2012

- (a) Unless otherwise permitted by this Annex, the transport of dangerous goods by air shall be conducted in accordance with Annex 18 to the Chicago Convention as last amended and amplified by the 'Technical instructions for the safe transport of dangerous goods by air' (ICAO Doc 9284-AN/905), including its supplements and any other addenda or corrigenda.
- (b) Dangerous goods shall only be transported by an operator approved in accordance with Annex V (Part-SPA), Subpart G, except when:
 - (1) they are not subject to the technical instructions in accordance with Part 1 of those instructions; or
 - (2) they are carried by passengers or crew members, or are in baggage, in accordance with Part 8 of the technical instructions.
- (c) An operator shall establish procedures to ensure that all reasonable measures are taken to prevent dangerous goods from being carried on board inadvertently.
- (d) The operator shall provide personnel with the necessary information enabling them to carry out their responsibilities, as required by the technical instructions.
- (e) The operator shall, in accordance with the technical instructions, report without delay to the competent authority and the appropriate authority of the State of occurrence in the event of:
 - (1) any dangerous goods accidents or incidents;
 - (2) the discovery of undeclared or misdeclared dangerous goods in cargo or mail; or
 - (3) the finding of dangerous goods carried by passengers or crew members, or in their baggage, when not in accordance with Part 8 of the technical instructions.
- (f) The operator shall ensure that passengers are provided with information about dangerous goods in accordance with the technical instructions.
- (g) The operator shall ensure that notices giving information about the transport of dangerous goods are provided at acceptance points for cargo as required by the technical instructions.

AMC1 CAT.GEN.MPA.200(e) Transport of dangerous goods

ED Decision 2014/015/R

DANGEROUS GOODS ACCIDENT AND INCIDENT REPORTING

- (a) Any type of dangerous goods accident or incident, or the finding of undeclared or misdeclared dangerous goods should be reported, irrespective of whether the dangerous goods are contained in cargo, mail, passengers' baggage or crew baggage. For the purposes of the reporting of undeclared and misdeclared dangerous goods found in cargo, the Technical Instructions considers this to include items of operators' stores that are classified as dangerous goods.
- (b) The first report should be dispatched within 72 hours of the event. It may be sent by any means, including e-mail, telephone or fax. This report should include the details that are known at that time, under the headings identified in (c). If necessary, a subsequent report should be made as soon as possible giving all the details that were not known at the time the first report was sent. If a report has been made verbally, written confirmation should be sent as soon as possible.
- (c) The first and any subsequent report should be as precise as possible and should contain the following data, where relevant:
 - (1) date of the incident or accident or the finding of undeclared or misdeclared dangerous goods;
 - (2) location, the flight number and flight date;
 - (3) description of the goods and the reference number of the air waybill, pouch, baggage tag, ticket, etc.;
 - (4) proper shipping name (including the technical name, if appropriate) and UN/ID number, when known;
 - (5) class or division and any subsidiary risk;
 - (6) type of packaging, and the packaging specification marking on it;
 - (7) quantity;
 - (8) name and address of the shipper, passenger, etc.;
 - (9) any other relevant details;
 - (10) suspected cause of the incident or accident;
 - (11) action taken;
 - (12) any other reporting action taken; and
 - (13) name, title, address and telephone number of the person making the report.
- (d) Copies of relevant documents and any photographs taken should be attached to the report.
- (e) A dangerous goods accident or incident may also constitute an aircraft accident, serious incident or incident. Reports should be made for both types of occurrences when the criteria for each are met.
- (f) The following dangerous goods reporting form should be used, but other forms, including electronic transfer of data, may be used provided that at least the minimum information of this AMC is supplied:

DANGEROUS GOODS OCCURRENCE REPORT
DGOR No:

1. Operator:		2. Date of Occurrence:		3. Local time of occurrence:	
4. Flight date:			5. Flight No:		
6. Departure aerodrome:			7. Destination aerodrome:		
8. Aircraft type:			9. Aircraft registration:		
10. Location of occurrence:			11. Origin of the goods:		
12. Description of the occurrence, including details of injury, damage, etc. (if necessary, continue on the reverse of this form):					
13. Proper shipping name (including the technical name):				14. UN/ID No (when known):	
15. Class/Division (when known):	16. Subsidiary risk(s):	17. Packing group:	18. Category (Class 7 only):		
19. Type of packaging:	20. Packaging specification marking:	21. No of packages:	22. Quantity (or transport index, if applicable):		
23. Reference No of Airway Bill:					
24. Reference No of courier pouch, baggage tag, or passenger ticket:					
25. Name and address of shipper, agent, passenger, etc.:					
26. Other relevant information (including suspected cause, any action taken):					
27. Name and title of person making report:			28. Telephone No:		
29. Company:			30. Reporters ref:		
31. Address:			32. Signature:		
			33. Date:		
Description of the occurrence (continuation)					

Notes for completion of the form:

1. A dangerous goods accident is as defined in [Annex I](#). For this purpose, serious injury is as defined in Regulation (EU) No 996/2010¹.
2. This form should also be used to report any occasion when undeclared or misdeclared dangerous goods are discovered in cargo, mail or unaccompanied baggage or when accompanied baggage contains dangerous goods which passengers or crew are not permitted to take on aircraft.
3. The initial report should be dispatched unless exceptional circumstances prevent this. This occurrence report form, duly completed, should be sent as soon as possible, even if all the information is not available.
4. Copies of all relevant documents and any photographs taken should be attached to this report.
5. Any further information, or any information not included in the initial report, should be sent as soon as possible to the authorities identified in [CAT.GEN.MPA.200\(e\)](#).
6. Providing it is safe to do so, all dangerous goods, packaging, documents, etc., relating to the occurrence should be retained until after the initial report has been sent to the authorities identified in [CAT.GEN.MPA.200\(e\)](#) and they have indicated whether or not these should continue to be retained.

GM1 CAT.GEN.MPA.200 Transport of dangerous goods

ED Decision 2014/015/R

GENERAL

- (a) The requirement to transport dangerous goods by air in accordance with the Technical Instructions is irrespective of whether:
 - (1) the flight is wholly or partly within or wholly outside the territory of a State; or
 - (2) an approval to carry dangerous goods in accordance with Annex V (Part-SPA), Subpart G is held.
- (b) The Technical Instructions provide that in certain circumstances dangerous goods, which are normally forbidden on an aircraft, may be carried. These circumstances include cases of extreme urgency or when other forms of transport are inappropriate or when full compliance with the prescribed requirements is contrary to the public interest. In these circumstances, all the States concerned may grant exemptions from the provisions of the Technical Instructions provided that an overall level of safety which is at least equivalent to that provided by the Technical Instructions is achieved. Although exemptions are most likely to be granted for the carriage of dangerous goods that are not permitted in normal circumstances, they may also be granted in other circumstances, such as when the packaging to be used is not provided for by the appropriate packing method or the quantity in the packaging is greater than that permitted. The Technical Instructions also make provision for some dangerous goods to be carried when an approval has been granted only by the State of origin and the State of the operator.
- (c) When an exemption is required, the States concerned are those of origin, transit, overflight and destination of the consignment and that of the operator. For the State of overflight, if none of

¹ Regulation (EU) No 996/2010 of the European Parliament and of the Council of 20 October 2010 on the investigation and prevention of accidents and incidents in civil aviation and repealing Directive 94/56/EC (OJ L 295, 12.11.2010, p. 35).

the criteria for granting an exemption are relevant, an exemption may be granted based solely on whether it is believed that an equivalent level of safety in air transport has been achieved.

- (d) The Technical Instructions provide that exemptions and approvals are granted by the 'appropriate national authority', which is intended to be the authority responsible for the particular aspect against which the exemption or approval is being sought. The Instructions do not specify who should seek exemptions and, depending on the legislation of the particular State, this may mean the operator, the shipper or an agent. If an exemption or approval has been granted to other than the operator, the operator should ensure a copy has been obtained before the relevant flight. The operator should ensure all relevant conditions on an exemption or approval are met.
- (e) The exemption or approval referred to in (b) to (d) is in addition to the approval required by Annex V (Part SPA), Subpart G.

CAT.GEN.MPA.205 Aircraft tracking system — Aeroplanes

Regulation (EU) 2015/2338

- (a) By 16 December 2018 at the latest, the operator shall establish and maintain, as part of the system for exercising operational control over the flights, an aircraft tracking system, which includes the flights eligible to (b) when performed with the following aeroplanes:
 - (1) aeroplanes with an MCTOM of more than 27 000 kg, with an MOPSC of more than 19, and first issued with an individual CofA before 16 December 2018, which are equipped with a capability to provide a position additional to the secondary surveillance radar transponder;
 - (2) all aeroplanes with an MCTOM of more than 27 000 kg, with an MOPSC of more than 19, and first issued with an individual CofA on or after 16 December 2018; and
 - (3) all aeroplanes with an MCTOM of more than 45 500 kg and first issued with an individual CofA on or after 16 December 2018.
- (b) Flights shall be tracked by the operator from take-off to landing, except when the planned route and the planned diversion routes are fully included in airspace blocks where:
 - (1) ATS surveillance service is normally provided which is supported by ATC surveillance systems locating the aircraft at time intervals with adequate duration; and
 - (2) the operator has provided to competent air navigation service providers necessary contact information.

AMC1 CAT.GEN.MPA.205 Aircraft tracking system — Aeroplanes

ED Decision 2021/008/R

EQUIPMENT, PERFORMANCE AND PROCEDURES WHEN AIRCRAFT TRACKING IS REQUIRED

- (a) Automatic tracking of aeroplane position

The aircraft tracking system should rely on equipment capable of automatically detecting and transmitting a position report to the aircraft operator, except if (d)(2) applies.
- (b) Position reporting period

The tracking of an individual flight should provide a position report at time intervals which do not exceed 15 minutes.

(c) Content of position reports

Each position report should contain at least the latitude, the longitude and the time of position determination and whenever available, an indication of the aeroplane altitude, except that for each flight:

- (1) One of the position reports may contain only time-stamped data indicating that the aeroplane has left the gate;
- (2) One of the position reports may contain only time-stamped data indicating that the aeroplane has become airborne;
- (3) One of the position reports may contain only time-stamped data indicating that the aeroplane has landed; and
- (4) One of the position reports may contain only time-stamped data indicating that the aeroplane has reached the gate.

(d) Source of position data

The data contained in a position report may come from:

- (1) ATC surveillance systems, if the ATC surveillance data source is capable of providing this data with a delay equal to or less than 10 minutes;
- (2) the flight crew, if the planned flight duration is less than two position reporting periods;
- (3) aeroplane systems. In that case:
 - (i) the source of time, latitude and longitude data should be the navigation system of the aeroplane or an approved GNSS receiver;
 - (ii) the source of altitude data should be:
 - (A) the same source as for time, latitude and longitude data, or
 - (B) an approved source of pressure altitude; and
 - (iii) the delivery time of position reports from the aeroplane to the operational control over the flight should, to the extent possible, not exceed 10 minutes; or
- (4) any data source when the position report is of a type designated by (c)(1), (c)(2), (c)(3) or (c)(4). In that case, the delivery time of position reports from the data source to the operational control over the flight should, to the extent possible, not exceed 10 minutes.

(e) Temporary lack of aircraft tracking data

Aircraft tracking data may be incomplete due to a temporary or unexpected issue prior to or during the flight. However, the operator should:

- (1) identify any loss of aircraft tracking data which is not due to a temporary issue, and
- (2) address any systematic lack of aircraft tracking data affecting a given aeroplane or a given route in a timely manner.

(f) Operational control over the flights

When abnormal flight behaviour is suspected, this should be checked and acted upon without delay.

(g) Recording of aircraft tracking data during normal operation

When the tracking of a flight is required, all related aircraft tracking data should be recorded on the ground, including position data from ATC surveillance systems when they are used. The aircraft tracking data of a given flight should be retained until confirmation that the flight is completed and no accident or serious incident occurred.

(h) Preserving aircraft tracking data after an accident or a serious incident

Following an accident or a serious incident, the operator should retain the aircraft tracking data of the involved flight for at least 30 days. In addition, the operator should be capable of providing a copy of this data without delay and in an electronic format that is human-readable using a common text file editor.

(i) Procedures

The operator should establish procedures describing its aircraft tracking system, including the identification of abnormal flight behaviour and the notification of the competent ATS unit (ATS unit responsible for providing the alerting service in the airspace where the aircraft is believed to be), when appropriate. These procedures should be integrated with the emergency response plan of the operator.

AMC2 CAT.GEN.MPA.205 Aircraft tracking system — Aeroplanes

ED Decision 2017/023/R

ROUTES INCLUDED IN AIRSPACE COVERED BY ATS SURVEILLANCE

- (a) Trajectory points located at a distance of less than 50 NM from the departure airfield and trajectory points located at a distance of less than 50 NM from the destination airfield may be considered as not part of the 'planned route'.
- (b) Trajectory points located at a distance of less than 50 NM from any diversion airfield may be considered as not part of the 'planned diversion routes'.
- (c) An ATS surveillance service may be considered 'supported by ATC surveillance systems locating the aircraft at time intervals with adequate duration' if those ATC surveillance systems are capable of locating aircraft at time intervals not exceeding 15 minutes when operated normally.
- (d) When applicable, the operator should check that the conditions required for using the exception defined by [CAT.GEN.MPA.205\(b\)](#) are fulfilled before operating into new airspace blocks.
- (e) When applicable, the operator should check at time intervals not exceeding 180 calendar days that the conditions required for using the exception defined by [CAT.GEN.MPA.205\(b\)](#) are maintained.

GM1 CAT.GEN.MPA.205 Aircraft tracking system — Aeroplanes

ED Decision 2017/023/R

EXPLANATION OF TERMS

For the understanding of the terms used in [CAT.GEN.MPA.205](#):

- (a) 'capability to provide a position additional to the secondary surveillance radar transponder' means airborne equipment other than the SSR transponder, which is operative and which can be used to automatically transmit time-stamped position data without change to the approved airborne systems; and

(b) ‘abnormal flight behaviour’: see [GM1 to Annex I](#) (Definitions).

GM2 CAT.GEN.MPA.205 Aircraft tracking system — Aeroplanes

ED Decision 2017/023/R

DETERMINING WHETHER A FLIGHT NEEDS TO BE TRACKED

Table 1 provides a summary of the cases applicable to an aeroplane which is within the scope of [CAT.GEN.MPA.205\(a\)](#).

Table 1: Cases applicable to the flight of an aeroplane subject to the aircraft tracking requirement

Condition 1: The planned route and the planned diversion routes are included in airspace blocks where ATS surveillance service is normally provided.	Condition 2: The ATS surveillance service provided in all airspace blocks determined by Condition 1 is supported by ATC surveillance systems locating the aircraft at time intervals with adequate duration.	Condition 3: The operator has provided all air navigation service providers competent for the airspace blocks determined by Condition 1 with the necessary contact information.	Case considered: Aeroplane that is within the scope of CAT.GEN.MPA.205(a) .
Conditions 1, 2 and 3 are met altogether.			The flight does not need to be tracked (refer to CAT.GEN.MPA.205(b)). Note: The operator should check at regular time intervals that Conditions 1, 2 and 3 are still met (refer to AMC2 CAT.GEN.MPA.205).
Either Condition 1, Condition 2 or Condition 3 is not met.			The flight shall be tracked (refer to CAT.GEN.MPA.205(b)). Note: Lack of aircraft tracking data due to a temporary or unexpected issue may be acceptable (refer to AMC1 CAT.GEN.MPA.205). Examples of issues (list is indicative and not exhaustive): airborne equipment found inoperative, transmission link disturbed by environmental factors; issue with the ground-based infrastructure or the space-based infrastructure.

GM3 CAT.GEN.MPA.205 Aircraft tracking system — Aeroplanes

ED Decision 2017/023/R

METHOD FOR ASSESSING WHETHER A FLIGHT NEEDS TO BE TRACKED

The following gives an example of a method to assess whether flights performed along a given route need to be tracked.

- (a) Determine the planned route and the planned diversion routes and consider only points of these routes located at a distance of greater than or equal to 50 NM from the departure airfield, the destination airfield and the diversion airfields. If there is no such point, then the flight does not need to be tracked, otherwise go to (b).
- (b) Identify all airspace blocks crossed by the result of (a) and go to (c).
- (c) If every airspace block meets all of the following conditions, then the flight does not need to be tracked:
 - (1) ATS surveillance service is provided in the airspace block;
 - (2) This ATS surveillance service relies on ATC surveillance systems which are normally capable of detecting aircraft in the airspace block at time intervals not exceeding 15 minutes; and
 - (3) The air navigation service provider competent for the airspace block has information sufficient to contact the on-duty staff at the operator;

GM4 CAT.GEN.MPA.205 Aircraft tracking system — Aeroplanes

ED Decision 2017/023/R

POSSIBLE SOURCES AND MINIMUM CONTENT OF A POSITION REPORT

Table 1 presents a summary of the possible sources and the minimum content of a position report according to [AMC1 CAT.GEN.MPA.205](#).

Table 1: Possible sources and minimum content of a position report

Planned flight duration	Possible sources of a position report	Minimum content of a position report
Flight duration < 2×reporting period	<ul style="list-style-type: none">— Airborne equipment (automatic transmission);— Flight crew; or— ATC surveillance systems.	Latitude, longitude and time (and whenever available altitude), except for the position reports designated by point (c)(1), (c)(2), (c)(3) and (c)(4) of AMC1 CAT.GEN.MPA.205 .
Flight duration ≥ 2×reporting period	<ul style="list-style-type: none">— Airborne equipment (automatic transmission);— ATC surveillance systems;— Flight crew if the flight is not required to be tracked; or— Any source for position reports designated by point (c)(1), (c)(2), (c)(3) and (c)(4) of AMC1 CAT.GEN.MPA.205.	

GM5 CAT.GEN.MPA.205 Aircraft tracking system — Aeroplanes

ED Decision 2017/023/R

AIRCRAFT TRACKING — CHOICE OF THE POSITION REPORTING PERIOD

- (a) Unless the aircraft tracking system includes functionalities enhancing the detection of deviations from normal operation (e.g. airborne systems capable of automatically transmitting more information under some conditions, possibility for the operational control to adjust the position reporting period of an ongoing flight, etc.), the choice of the position reporting period has a significant influence on the effectiveness of the aircraft tracking system.

- (1) Indeed, assuming that an operator has set itself the objective of detecting, within a given time T, deviations from normal operation, and that the operator relies for this purpose only on position reports, then the position reporting period needs to be less than T.
 - (2) Furthermore, when no other information than position reports is available to locate a missing aircraft, then the search zone is a circle with a radius corresponding to the distance likely to have been covered since the last detection. The corresponding search area grows as the square of the time, until the position of the aircraft is detected again or the fuel on board is exhausted. Taking the example of an aeroplane cruising at Mach 0.8 (i.e. covering a distance of about 8 NM per minute), after 15 minutes the search area is 155 000 square kilometres.
 - (3) In the publication of the Australian Transportation Safety Bureau titled 'The Operational Search for MH370' (dated October 2017), it is recommended that 'Aircraft operators, aircraft manufacturers, and aircraft equipment manufacturers investigate ways to provide high-rate and/or automatically triggered global position tracking in existing and future fleets'.
- (b) It is advised to take the above into account when setting up the aircraft tracking system.

GM6 CAT.GEN.MPA.205 Aircraft tracking system — Aeroplanes

ED Decision 2021/008/R

PROVIDING CONTACT INFORMATION TO COMPETENT AIR NAVIGATION SERVICE PROVIDERS

A solution for the operator to make the necessary contact information available to all competent air navigation service providers (ANSPs) could be to register to the global OPS Control Directory of ICAO. Another possible way is to provide in the ATS flight plan (item 18 'Other information') information sufficient to contact the on-duty staff of the aircraft operator.

GM7 CAT.GEN.MPA.205 Aircraft tracking system — Aeroplanes

ED Decision 2017/023/R

GUIDANCE

Additional guidance for the establishment of an aircraft tracking system is found in ICAO Circular 347 – Aircraft Tracking Implementation Guidelines, dated 2017.
